THE tar is introduced by pipe 13 into the bottom compartment of condenser 8, and rising through the pipes becomes heated by the products of distillation from retort 3. It then passes down pipe 10 into the lower part of condenser 9a, where it is further heated by the residue of the distillation coming from retort 4. Passing through tube 11, it enters retort 3, which is inclined at a suitable angle, and flows down it in a slow stream: the bottoms of the retorts are provided with numerous shallow ribs or baffle plates (as 7), causing the tar to take a circuitous course. On reaching the lower end of retort 3, the tar passes through pipe 5 into retort 4, where it is further distilled, and the residue is run off through 12 into condenser 9a. The distillation products from retort 4 pass through pipe 6 to retort 3, and thence to condenser 8 by pipe 9. The retorts are enclosed in a brickwork casing 1, and heated by a furnace 2, so that the lower retort is more strongly heated than the upper one, and the tar is progressively distilled.—T. F. B.

Mineral Oils in general and Petroleum in particular; Process for Transforming — into Soap. M. Kuess, Tunis. Eng. Pat. 23,727, Nov. 2, 1904. Under Int. Conv., Nov. 3, 1903.

IN this process the petroleum or other mineral oil (say, 8 kilos.) is thoroughly incorporated with rosin (1½ kilos.) and with melted fat (1½ kilos.), and the mixture treated with caustic soda solution (650 grms. in 1300 c.c.) and allowed to stand for two hours with constant agitation. It is then mixed with, say, 325 grms. of commercial hydrochloric acid, added little by little, and stirred until cool, after which it is treated with more caustic soda solution (325 grms. in 1300 c.c.), again allowed to stand, preferably for one or two days, and finally boiled for four hours and poured into moulds. It is claimed that this soap has great antiseptic and cleansing properties, that it is soluble in water, and that it is free from any unpleasant odour.—C. A. M.

UNITED STATES PATENTS.

Candles; Manufacture of Composite Paraffin — G. W. Gray, Whiting, Ind., Assignor to the Standard Oil Co., Chicago, Ill. U.S. Pat. 802,100, Oct. 17, 1905.

THREE parts of hydroxystearic acid (see U.S. Pat. 772,129 of 1904; this J., 1904, 1102) are dissolved in one part of a suitable solvent (e.g., stearic acid), and the solution is mixed with paraffin wax to form a stock for the manufacture of composite candles.—T. F. B.

Wax; Artificial — J. Lewy, Königsberg, Germany. U.S. Pat. 802,169, Oct. 17, 1905.

AN artificial wax is prepared by mixing "paraffin" with a naphthol (especially β-naphthol), with or without addition of stearin or ceresin or both.—T. F. B.

FRENCH PATENTS.

Coke-Oven; Horizontal, Regenerative — with Double Vertical Flues. F. J. Collin. Fr. Pat. 354,919, May 30, 1905.

A DOUBLE row of vertical flues, separated by a central wall, is placed between each oven. Each pair of vertical flues is connected by an opening formed in the upper part of the dividing wall, and each flue is connected with a separate main flue which passes beneath the sole of the oven. The gas rises in one vertical flue and descends in the other, and the reversal of the current of gas may be made to affect the whole row or only a few of the vertical flues.—W. H. C.

Coal; Method of Enriching Small Lean — H. Koppers. Fr. Pat. 355,355, June 19, 1905.

NON-COKING coal is distilled to drive off the volatile matters, principally ammonia, in order to produce a fuel of increased calorific value whilst recovering by-products. The hot residue is then incorporated with the usual binding material (tar or pitch) and pressed into briquettes

in the usual manner. Distillation is conducted in a vertical or inclined retort, charged at the top and emptied at the bottom. Heat is applied from the outside, and at the lower part (which may be of cast iron) is arranged a cooling zone, the heat liberated from which is utilised in heating up the air of combustion for the furnace.—C. S.

Ammoniacal Gas contained in Gases of Distillation; Recuperator for Arresting — A. Mars, J. Bacqua and M. Laurette. Fr. Pat. 355,375, March 17, 1905.

THE gases of distillation are caused to traverse chambers in which baskets or packages filled with a mixture of humus, turf, or sawdust, treated with sulphuric acid, are arranged in successive tiers separated by spaces, the packages being also separated on each plane by intervals uncomformable to those above and below, so that the gases may be compelled to pass through the porous material. It is claimed that the process, while drying the gas and removing its ammoniacal constituents, yields a product of direct manurial value.—E. S.

Emulsions of Coal Tar Oils, Phenols, and similar Products, also of Crude Mineral Oils and their Residues; Process for Preparing Aqueous — W. Spalteholz. Fr. Pat. 355,342, June 19, 1905.

COAL tar oils and derivatives and mineral oils and their residues may be emulsified by the aid of alkaline solutions of casein or of the products obtained by the partial decomposition of casein or other albuminoid with bases or acids, or by fermentation. For example, a liquid, miscible with water, containing 30 to 35 per cent. of phenol, is obtained by mixing 650 kilos. of creosote oil with 350 kilos. of an aqueous solution containing 12 kilos. of casein and 12 kilos. of ammonia (sp. gr. 0.945).—T. F. B.

Oil; Method of Distilling Mineral — S. Stransky. Fr. Pat. 355,414, June 20, 1905.

THE contents of the still are set in motion as soon as the operation is started, and are kept in that condition throughout the process, in order to prevent coking on the bottom of the still by keeping in suspension the diminished quantity of particles of carbonised matter from the heavy hydrocarbons, and avoiding local overheating. With this object the still is fitted with a stirring apparatus extending right to the bottom of the vessel.—C. S.

Oils; Chemical Purification of [Mineral] — J. Fischer. Fr. Pat. 355,465, June 22, 1905.

IN this process the oil (petroleum oil, lubricating oil, &c.), is made to pass upwards through layers of material such as perforated discs, pebbles, &c., which keep it for some time in contact with the purifying agent, e.g., sulphuric acid. Claim is also made for various modifications of apparatus for carrying out this process, and for various forms of the retarding substances, a battery of apparatus being used for the purification of large quantities of oil. The purifying agent is made to traverse the layers either in the same or the opposite direction to the oil.—C. A. M.

IV.—COLOURING MATTERS AND DYE-STUFFS.

(Continued from page 1106.)

Ethylaniline; Simple Method of Preparing Pure Mono — from Commercial Monoethylaniline. G. Blume and H. Klöffler. Ber., 1905, 38, 3276.

NINETY-SEVEN grms. of commercial mono-ethylaniline were treated with 65 c.c. of concentrated hydrochloric acid, and the hydrochloride which crystallised out after a short time, was separated with the aid of the pump, and pressed. Further small quantities of the hydrochloride were separated by passing gaseous hydrochloric acid through the mother liquor. The total quantity of hydrochloride obtained, after drying upon a porous tile, was 101 grms., equivalent to a yield of about 80 per cent. The hydrochloride was decomposed with caustic soda and distilled with steam, and the ethylaniline was separated from the distillate, dried and re-distilled.—A. S.

2-Hydroxy-1,4-Naphthoquinone; Note on a Simple Method of Preparing — H. Teichner and H. Weil. Ber., 1905, 38, 3376–3377.

If 1,2-naphthoquinone is oxidised with an excess of hydrogen peroxide and caustic soda, an intramolecular change takes place, and 2-hydroxy-1,4-naphthoquinone is formed. Similarly 1,2-naphthoquinone-6-sodium sulphinate (the quinone of Schäffer-salt) forms 2-hydroxy-1,4-naphthoquinone-6-sodium sulphinate under these conditions. On the other hand 1,2-naphthoquinone-3,6-sodium disulphonate (the quinone of R-salt) behaves quite differently and does not form a corresponding hydroxy derivative of 1,4-naphthoquinone, probably owing to the influence of the sulphonic group in position 3.

— H. L.

Oryzo Compounds; Constitution of — H. Teichner. Ber., 1905, 38, 3377–3380.

THE author condensed 1,2-naphthoquinone-3,6-disulphonic acid ("R-quinone") with phenylhydrazine and shows that the hydrazone obtained is not identical with the azo dyestuff obtained by combining R-salt with diazobenzene. On the other hand the hydrazones obtained from 1,2-naphthoquinone-6-sulphonic acid ("S-quinone") and other sulphonic derivatives of 1,2-naphthoquinone were found to be exactly similar to the corresponding azo dyestuffs in their reactions and tinctorial properties.

"R-quinone" readily reacts with aniline, forming in good yield orange-coloured crystals of the constitution

$[\text{O}_2 : (\text{SO}_3\text{Na})_2 : \text{NHC}_6\text{H}_5 :: 1 : 2 : 3 : 6 : 4]$. This substance may be condensed with *o*-toluylenediamine, to form an azine dyestuff, a characteristic reaction for *o*-diketones. On the other hand the corresponding derivative of "S-quinone" does not react with *o*-toluylenediamine.

The presence of a sulphonic group in position 3 causes the formation of β -naphthoquinone derivatives in the case of "R-quinone," whereas the "S" and other 1,2-naphthoquinone derivatives go over into derivatives of α -naphthoquinone. (See also preceding abstract.)—H. L.

Titanium Chloride in Volumetric Analysis; Use of — E. Knecht and E. Hibbert. XXIII., page 1192.

ENGLISH PATENTS.

Colouring Matters containing Sulphur [Sulphide Dyestuffs]; Black — Read Holliday and Sons, and J. Turner and H. Dean, Huddersfield. Eng. Pat. 26,345, Dec. 3, 1904.

BLACK sulphide dyestuffs are obtained by boiling 1,2,4-dinitrochlorobenzene with alkalis, sodium sulphide and sulphur in aqueous solution at 100°–130° C. for 15–30 hours.—H. L.

Benzene Derivatives and [Sulphide] Dyestuffs therefrom; Manufacture of — R. B. Ransford, Upper Norwood, Surrey. From L. Cassella and Co. Frankfurt on Maine, Germany. Eng. Pat. 26,361, Dec. 3, 1904.

PHOSGENE is introduced into an aqueous solution of 1-acetamino-2,4-diaminobenzene containing sufficient sodium carbonate to neutralise the hydrochloric acid formed. A colourless substance separates, which is dried and then heated with 3 parts of sulphur to 240° C. for some time. A dyestuff is thus obtained, which is soluble in dilute sodium sulphide solution and dyes cotton in greenish-yellow shades from this medium.—H. L.

Dyestuffs; Manufacture of New Sulphurised [Sulphide] — C. D. Abel, London. From Act.-Ges. f. Anilinfabr., Berlin. Eng. Pat. 27,091, Dec. 12, 1904.

THE new dyestuffs are prepared by heating mixtures of diformyl-*m*-toluylenediamine and *p*-phenylenediamine with sulphur at temperatures of 200° C. and over. They dye cotton directly in intense yellow to orange-yellow shades from baths containing sodium sulphide. (Compare Third Addition to Fr. Pat. 306,655 of 1903; this J. 1903, 792.)—H. L.

Lakes [from Azo Dyestuffs]; Manufacture of New Colour — C. D. Abel. From Act.-Ges. f. Anilinfabr., Berlin. Eng. Pat. 27,093, Dec. 12, 1904. *CHL.*, page 1180.

Dyestuffs; Manufacture of Sulphurised [Sulphide] — and of a Parent Material therefor. C. D. Abel, London. From Act.-Ges. f. Anilinfabr., Berlin. Eng. Pat. 27,292, Dec. 14, 1904.

AN insoluble condensation product is obtained by boiling an alcoholic solution of *m*-toluylenediamine (4 mol.) with carbon bisulphide (2 mols.) for 24 hours. By fusing this substance, with or without the addition of benzidine, with sulphur at a temperature of 210–220° C., new dyestuffs are obtained. The latter produce clear shades, varying from greenish-yellow to orange-yellow, on unmordanted cotton from their solution in aqueous sodium sulphide, which are stated to be of remarkable fastness to washing.—H. L.

***p*-Amidophenolsulphonic Acid; Manufacture of** — C. D. Abel, London. From Act.-Ges. f. Anilinfabr., Berlin. Eng. Pat. 27,498, Dec. 16, 1904.

SEE Ger. Pat. 160,170 of 1904; this J., 1905, 886.—T. F. B.

Colouring Matters of the Anthracene Series [Anthracene Dyestuffs]; Manufacture of New — J. Y. Johnson, London. From Badische Anilin und Soda Fabrik, Ludwigshafen on Rhine, Germany. Eng. Pat. 28,593, Dec. 28, 1904.

SEE Addition of Jan. 6, 1905, to Fr. Pat. 349,531 of 1904; this J., 1905, 841.—T. F. B.

Anthracene Series; Manufacture of Compounds of the — and of Colouring Matters [Anthracene Dyestuffs] therefrom. J. Y. Johnson, London. From Badische Anilin und Soda Fabrik, Ludwigshafen on Rhine, Germany. Eng. Pat. 7022, April 3, 1905.

SEE Third Addition, dated March 20, 1905, to Fr. Pat. 349,531 of 1904; this J., 1905, 1010.—T. F. B.

Dyestuffs; Manufacture of Yellow Sulphur [Sulphide] — G. B. Ellis, London. From Chem. Fabr. vorm. Sandoz, Basle. Eng. Pat. 5572, March 16, 1905.

GREENISH-YELLOW to orange-yellow sulphide dyestuffs are obtained by melting diformyl-4,6-diamino-1,3-xylene with sulphur in the presence of heavy volatile aromatic amines such as benzidine, its homologues and derivatives, at temperatures varying from 180–220° C.—H. L.

Dyestuff Especially Suitable for the Preparation of Colouring Matter Lakes; Manufacture of a New Tetrazo [Azo] — H. E. Newton, London. From Farbenfabr. vorm. F. Bayer and Co., Elberfeld, Germany. Eng. Pat. 9139, May 1, 1905.

SEE Fr. Pat. 353,816 of 1905; this J., 1905, 1061.—T. F. B.

UNITED STATES PATENTS.

Dyestuff; Yellow-red Azo — W. Herzberg, Assignor to Act.-Ges. f. Anilinfabr., Berlin. U.S. Pat. 800,914, Oct. 3, 1905.

SEE Eng. Pat. 27,093 of 1904, page 1180.—T. F. B.

Dye [Anthracene Dyestuff]; Anthraquinone — P. Thomaschewski, Elberfeld, Germany, Assignor to Farbenfabr. of Elberfeld Co., New York. U.S. Pat. 801,418, Oct. 10, 1905.

A DYESTUFF, which is a hydro-azine of the anthracene series, is obtained by heating 1-hydroxy-3-bromo-4-aminoanthraquinone with cupric chloride and a suitable diluent. It is reduced by alkali hydrosulphites to a hydro compound, solutions of which dye unmordanted cotton pure greenish-blue shades.—T. F. B.

Dye [Sulphide Dyestuff] and Process of Making same; Brown Sulphur — A. L. Laska, Assignor to K. Ochler, Anilin- und Anilin-farbenfabr., Offenbach on the Maine, Germany. U.S. Pat. 801,598, Oct. 10, 1905.

A MIXTURE of a *m*-diamine of the benzene series with the condensation product of formaldehyde and resorcinol is

melted with an alkali polysulphide: the resulting dye-stuffs give brown solutions in a solution of an alkali sulphide, which dye fast brown shades on cotton.—T. F. B.

Dyestuff; Green-Blue Sulphur [Sulphide] — and Process of Making same. I. Levinstein and E. E. Naeff, Manchester. U.S. Pat. 802,049, Oct. 17, 1905.

SEE Eng. Pat. 26,700 of 1903; this J., 1904, 1084.—T. F. B.

FRENCH PATENTS.

Thiazol-sulphonic Acids; Production of —. Farbenfabr. vorm. F. Bayer und Co. First Addition, dated March 11, 1905, to Fr. Pat. 353,928, March 6, 1905 (this J., 1905, 1061). Under Int. Conv., June 30, 1904.

THE thiazol-sulphonic acids claimed in the main patent can also be produced by replacing the benzyldieneamino-aryl-sulphonic acids by the corresponding benzylamine derivatives. The latter are prepared by the action of benzylhaloides, such as benzyl or nitrobenzyl chloride, on aromatic aminosulphonic acids, such as 2,5,7-amino-naphthol sulphonic acid, in the presence of sodium acetate.—H. L.

Azo Dyestuffs Capable of Being Chromed on the Fibre; Production of —. Soc. pour l'Ind. Chim. à Bâle. First Addition, dated May 10, 1905, to Fr. Pat. 351,125, Jan. 4, 1905 (this J., 1905, 840). Under Int. Conv., Dec. 27, 1904.

THE present addition to the main patent covers the combination of 1-diazo-2-acetyloxynaphthalene-sulphonic acids with naphthols, dihydroxynaphthalenes, naphthol-sulphonic acids, dihydroxynaphthalene-sulphonic acids and aminonaphtholsulphonic acids, with elimination of the acetyl group after combination. Further, the combination of 1-diazo-2-hydroxynaphthalenesulphonic acid (obtained by hydrolysis of 1-diazo-2-acetyloxynaphthalenesulphonic acids, or in any other manner) with 1,6-, 1,5-, 1,8-, or 2,7-dihydroxynaphthalene is also claimed.

A number of examples are given. Thus, by combining 1-diazo-2-acetyloxynaphthalene-4-sulphonic acid with 1,4-naphtholsulphonic acid a dyestuff is obtained which dyes wool from an acid bath in Bordeaux shades, turning to blue by after-chroming on the fibre. A slightly greener shade of blue is obtained after chroming from 1,5-naphtholsulphonic acid; while 2,6-naphtholsulphonic acid gives a blue-black. From the same first component and 1,8,3,6-dihydroxynaphthalenedisulphonic acid pure bright blue shades turning to bluish-green on chroming, are obtained. Similar shades both before and after chroming are obtained from 1,8,4-, and 1,8,4,6-dihydroxynaphthalene- mono- and disulphonic acids; 2,3,6-dihydroxynaphthalenesulphonic acid yields Bordeaux shades, turning to blue-black on chroming.

The same diazo-component and 1,8,3,6-aminonaphthol-disulphonic acid yield pure blue shades, turning to greenish-black on chroming; and other 1,8-amino-naphtholsulphonic acids, such as the 1,8,4-, 1,8,5-, 1,8,2,4-, and 1,8,4,6-acids produce a similar result. Bordeaux to dark violet shades turning to greenish-black are obtained from 2,7,6- and 2,5,7-aminonaphtholsulphonic acids.

1-Diazo-2-hydroxynaphthalene-4-sulphonic acid and 1,6-dihydroxynaphthalene yield a dyestuff which dyes wool from an acid bath in Bordeaux shades, turning to a deep black with green overcast by chroming. The chromed dyeings of this combination, it is stated, are very fast to light, milling and finishing, and do not change in artificial light. The corresponding dyestuffs from 2,8-, 2,7-, or 1,5-dihydroxynaphthalene also yield black shades after chroming; the direct dyeings from the 2,8-dihydroxynaphthalene dyestuff are blue.—H. L.

Dyestuffs Derived from Dihydroxyquinoline; Production of Azo —. Badische Anilin und Soda Fabrik. Fr. Pat. 355,146, June 10, 1905. Under Int. Conv., Dec. 2, 1904.

SEE Eng. Pat. 11,202 of 1905; this J., 1905, 840.—T. F. B.

V.—PREPARING, BLEACHING, DYEING, PRINTING, AND FINISHING TEXTILES, YARNS, AND FIBRES.

(Continued from page 1107.)

ENGLISH PATENTS.

Yarns; Apparatus for Spraying and Conditioning —. G. and A. Wray, Keighley. Eng. Pat. 23,651, Nov. 2, 1904.

YARNS, in the form of cops, or wound upon bobbins or spools, are "damped" while being conveyed upon a travelling apron through a continuously-acting water-spray apparatus. During their passage through this they touch a contact-piece which turns them half-way round, so that those parts of their outer surfaces which were at first not exposed to the descending water-spray are now presented to it, and the cops, &c., become thoroughly moistened. In an alternative arrangement, two aprons, one above the other, are employed. The cops are carried by the upper one of these half-way through the apparatus, and are then overturned upon the lower one. The excess of the water employed in the operation falls into a tray beneath the apron or aprons, whence it is conducted into a receptacle, from which it is pumped to the spray-producer at any desired pressure, giving a fine or coarse spray as required.—E. B.

Dyestuffs on Fabrics, Warps, or the like; Method of and Apparatus for Distributing —. O. Imray, London. From Farb. vorm. Meister, Lucius und Brüning, Hoechst on the Maine. Eng. Pat. 27,871, Dec. 20, 1904.

BLENDED shades, varying from light to dark, or from one colour to another, are produced by spraying a dyestuff solution on to a fabric by a rotating brush or brushes in the following manner.

Fig. 1 is a transverse section and Fig. 2 a part front elevation of the apparatus. A brush cylinder *a* is supplied with a dye solution by a distributing cylinder *b*, from two colour cylinders *c*, *d*, each consisting of a number of small cylinders such as *c*¹, *c*², *c*³, revolving in separate compartments *c*¹, *c*², *c*³ of a dye-trough, thus supplying the distributing cylinder with the same or different colours. The component cylinders of cylinder *d* revolve in subdivisions of the trough *f* and are so mounted on their shaft, that they alternate with the cylinders *c*¹, *c*², and *c*³. The wire bristles of the brush cylinder *a* come in contact with a wire screen *h*, of which the meshes are about 5 mm. width, held in a stretched condition by bars *g*, *g*¹, at a short distance in front of the fabric *k*. The latter travels over

FIG 1

FIG. 2.

the guides j , j_1 , and after having received the spray, travels between squeezing rollers. The speed at which the fabric and cylinders revolve may vary according to the effect desired; it is preferable for the speed of the fabric to be less than the circumferential velocity of the brush cylinder.

If the separate dye compartments are supplied with dye solutions of successively greater strength, the fabric is dyed in shades uniformly increasing in depth from one side of the goods to the other. The effects may, however, be greatly varied. Thus, if comparatively many colours are sprayed on to a feebly moistened piece of woollen fabric which is slowly passed before the brush, the separate drops run completely into one another. On the other hand if the cylinder be supplied with comparatively few colours and a dry paper is passed quickly before it, the paper will be uniformly sprinkled with fine drops which lie closely together but do not run into each other. A uniformly shaded appearance is thus produced on the paper.

Various modifications of component parts of the machine are also described.—H. L.

FRENCH PATENTS.

Textile Material or Paper Pulp; Application of a Plant [Gyspet] for Obtaining —. P. Boy. Fr. Pat. 350,117, Aug. 16, 1904.

GYPSET (*Festuca crica*), a plant which is abundant in France, particularly in Ariège, can be utilised in the usual manner to produce a textile fibre or paper pulp.—T. F. B.

Fibres, Films, Blocks or Slabs; Plastic and Transparent Substance for the Manufacture of —. H. C. M. L. Cathelineau and A. A. René, Fleury. Fr. Pat. 351,912, June 5, 1905.

(1) 3 PARTS of phenol are mixed and well stirred with 1 part of casein. The mass is allowed to stand for 24 hours, and is then warmed up on the water-bath. A very limpid fluid is thus obtained which can be drawn out, like artificial silk, into threads capable of being woven into a fabric. Spread on to a flat surface it forms, on cooling, perfectly transparent films, which can be used for photography or for the cinematograph. These films possess the very valuable property it is claimed, of being non-inflammable, and the cost of production is low. The elasticity and tenacity may be increased by adding varying quantities of cellulose nitrates, hydrates or acetates to the product, while yet in a fluid state.

(2) 17 parts of phenol are mixed with 40 parts of casein. The mixture is then pressed, and the resulting paste is heated to 100° C., and again pressed. A transparent block, which can be cut up into slabs is obtained on cooling. Marble effects may be obtained by adding suitable colouring matters to the mixture either before or after heating. The pliability or elasticity is increased by the addition of nitrocellulose, acetanilide, "terpene," or glycerin. In both instances guaiacol or creosote may replace phenol.—H. L.

Silk; Artificial "Rahlerid" —. P. Germain, Fr. Pat. 355,016, June 7, 1905.

A SOLUTION of caoutchouc or similar gum in acetone is added, in any desired proportion, to a solution of nitrocellulose in acetone, and the mixture is made into threads by passing it into water or other suitable liquid. The resulting threads are stated to be very brilliant in appearance, extremely elastic, and very resistant to the atmosphere and to water. The product is not more inflammable than natural silk.—T. F. B.

Benzene employed for Cleaning Textiles; Process and Apparatus for Recovery of the —. E. Delhotel. Second Addition, dated May 4, 1905, to Fr. Pat. 344,848, July 16, 1901 (this J., 1904, 1213).

BETWEEN the heated chamber and the condensing tower of the principal patent, a series of enclosed tubes or similar device is interposed, and through this both the ingoing dry air and the hot escaping gases containing the recovered benzene are made to pass. One of the currents passes inside and the other outside the tubes in different directions. By these means an interchange of heat between the two takes place; with the result that a quantity of benzene is already condensed in this apparatus, which thus relieves the condensing tower and saves cooling water. Simultaneously there is a corresponding decrease in the fuel necessary for the heating chamber. (See also First Addition, this J., 1905, 727.)—H. L.

Ramie and other Bast Fibres, Treating [Degumming and Bleaching] —. J. Harris. Fr. Pat. 354,599, May 24, 1905. Under Int. Conv., Dec. 30, 1904.

FIBROUS masses of ramie, &c., in the dry, natural condition, are degummed, bleached, and separated into ultimate fibres, by the following process:—The fibrous strips are steamed, after being moistened with a dilute (1 per cent.) solution of caustic alkali, and then for a second time, after immersion in a (2 per cent.) solution of common salt or in a bath of linseed oil, soft soap and dilute caustic alkali. After rinsing, the strips are partly dried and are again placed in the steaming apparatus, where they are acted upon by ozone and steam, either separately or together. The fibres are next mechanically separated with combs or cylinders. They are finally rendered lustrous by immersion in a bath of linseed oil, emulsified with soap. The fibres are thus obtained in a state suitable for spinning.—E. B.

Yarns [in the form of Chains]; Process of Bleaching, Dyeing and Finishing —. E. Engel. Fr. Pat. 354,491, May 20, 1905.

YARNS, in the form of hanks, are connected together to form long continuous chains, by taking a hank a (see figure), passing a second hank a' through this, allowing its ends to fall to the same distance on each side of the first hank, thus making two loops, and then placing a third hank in the same fashion in the loops thus produced, and so on with the rest of the hanks. The chains of hanks are then passed, singly or a number of them together, through dye-baths, &c., or successively through mordanting and dye baths, &c., the yarns, it is stated, being thus dyed, &c., without the threads becoming entangled.—E. B.

Blankets and Similar Textiles; Method of Dyeing in Graded Tints [Ombres] —. L. and H. Pépin. Fr. Pat. 354,505, May 22, 1905.

BLANKETS, sheetings and similar tissues are stretched upon a system of rollers, arranged in two sets, one above the other, within a dye-vessel, which is partly filled with a concentrated dye-liquor. Water is gradually

added to dilute the bath, causing the tissues to become dyed in regularly graded tints. The rollers of the upper set are mounted in a frame which is moved slightly to and fro during the dyeing operation, to prevent any portions of the tissues from remaining long in contact with the rollers and thus becoming imperfectly dyed.—E. B.

Textiles, Paper, Leather, &c.; Decoration of all kinds of —. L. Guetton-Dangon. First Addition, dated Aug. 6, 1904, to Fr. Pat. 349,341, March 19, 1904 (this J., 1905, 617).

THE loose patterns of the principal patent are fixed round a cylinder in any required arrangement, and in such a manner that they can be easily and quickly removed. The goods are passed between this roller and another revolving at the same rate, which may be heated if required.—H. L.

Hydrosulphites; Production of — Dry and Quite Stable. Badische Anilin und Soda Fabrik. Third Addition, dated May 6, 1905, to Fr. Pat. 341,718 of March 28, 1904. *Ch.*, page 1172.

Discharging [Dyed Textiles] on Coloured Grounds; Method of —. Badische Anilin und Soda Fabrik. Fr. Pat. 355,117, June 9, 1905. Under Int. Conv., April 25, 1905.

ERRATUM.—This Journal 1905, 1107, col. 2, the second title from top is wrong, and should read: "*Wool; Process and Apparatus for Degreasing —.*" A. H. Burt, H. Jackson and C. A. Finch. Fr. Pat. 354,667, May 26, 1905.

Please gum slip which appears on cover, and with correct title, over aforesaid erroneous title, *loc. cit.*

GERMAN PATENT.

Wool; Process for Degreasing and Cleansing Raw — by Means of Carbon Tetrachloride. Delainage Ver-viétois Peltzer and Co. Ger. Pat. 160,375, Jan. 28, 1903.

THE patent provides a process for preventing loss of carbon tetrachloride in the scouring of wool. The air containing carbon tetrachloride, in a state of vapour or in suspension, is led from the scouring apparatus through a body of material which absorbs carbon tetrachloride. Raw wool may be used for this purpose, so that, when it is saturated with the solvent, it may be transferred to the scouring apparatus.—T. F. B.

(Continued from page 1109.)

Chamber Process [Sulphuric Acid Manufacture]; True Value of the Fan in the —. H. Rabe. *Z. angew. Chem.*, 1905, 18, 1735—1739.

THE author points out that the rate of working of a set of chambers is determined by the gas-velocity, understanding by that the volume of gas passing through unit volume of chamber space per second. Provided this quantity be

kept the same, no throttling at any particular place can affect the working of the chambers. If the current of gases be "throttled" in front of the Gay-Lussac tower, for instance, and the volume of gas passing through the chambers per second be reduced, the volume passing through the Gay-Lussac tower is correspondingly reduced, and the same effect would have been produced by throttling behind instead of in front of the Gay-Lussac tower. This is equally true whether chimney-draught or fan-propulsion be the motive power; and as far as the use of the fan to increase the intensity of the working is concerned, the fan is to be looked on simply as a means of overcoming frictional resistance, and its position in the system must be a matter of indifference. Provided the fan creates a certain gradient of pressure from end to end of the system, it makes no difference whether there is throughout a *plus* pressure, throughout a *minus* pressure, or partly one and partly the other, compared with the pressure of the atmosphere. The differences in pressure which produce the motion of the gases are so small compared with the atmospheric pressure—or even compared with the variations of atmospheric pressure at different times or in different localities—that the absolute pressure under which the process is conducted can have no influence on the results. It is thus quite impossible to make the working of the burners "independent" of that of the chambers (Lüty, this J., 1905, 922) by a fan, wherever situated: the fan simply affords a means of controlling and varying the rate of working of the system as a whole.

Naturally, other circumstances may point out one place or another as the most advantageous for the fan—for economy of power, for instance, it would be placed at the end of the system, where the volume of gas to be dealt with is least, or, if it must not encounter acid gases, it would be placed before the burners and drive the air through them—but, looked at simply as a means of overcoming frictional resistance, and hence of either allowing the introduction of apparatus producing such resistance—dust chambers, plate towers—or of carrying a greater volume of gases than formerly through a given system, its effect is entirely independent of its position.

—J. T. D.

Salt-petre [Potassium Nitrate]; Report on the Manufacture and Composition of Indian —. D. Hooper. *Agricult. Ledger*, 1905 [3], 17—48. Office of the Superintendent, Government Printing, Calcutta, India. Price 6d.

IN this report the author discusses the process of nitrification, with special reference to the conditions obtaining in India; gives an account of the districts where nitre earths occur, and where the salt is manufactured; describes the process of manufacture; and also gives a series of analyses of samples of nitre earths, crude and refined salt-petre, and impure and purified table salt and other by-products.—A. S.

Potassium Chromates. F. A. H. Schreinemakers. *Chem. Weekblad.*, 1904, 1, 837—848. *Chem. Centr.*, 1905, 2, 1067.

JAEGER and KRÜSS (Ber. 1889, 22, 2028) have previously examined the four salts K_2CrO_4 , $K_2Cr_2O_7$, $K_2Cr_3O_{10}$, $K_2Cr_4O_{13}$. They prepared the tri- and tetra-chromates by treating the bichromate with nitric acid. The author finds that these salts can also be prepared by adding the requisite quantities of chromium trioxide to the normal chromate or bichromate. The ternary system comprising water, potassium oxide and chromium trioxide was examined at 30° C. At this temperature, 100 grms. of water will dissolve 64.91 grms. of normal potassium chromate and 18.12 grms. of potassium bichromate, and it is, therefore, not possible to separate the normal chromate from a solution of the bichromate by addition of the base (potassium hydroxide) as in the case of the ammonium chromates. In both cases, however, the bichromate can be separated from a saturated solution of the normal chromate by the addition of chromium trioxide. As in the case of the ammonium salts, the tri- and tetra-chromates of potassium are decomposed into bichromate by addition of water at 30° C. (See following abstract.)—A. S.

Ammonium Chromates. F. A. H. Schreinemakers. Chem. Weekblad., 1904, 1, 395—410. Chem. Centr., 1905, 2, 1066—1067.

THE author examined the ternary system comprising chromium trioxide, ammonia, and water, at 30° C. Normal ammonium chromate cannot be dried at 100° C. without decomposition; even at lower temperatures it gives off ammonia, with formation of the bichromate. The normal chromate and bichromate dissolve in water without decomposition, but the tri- and tetrachromates are decomposed by water. All the other ammonium chromates can be prepared from the normal chromate by the addition of chromium trioxide. At 30° C. 100 grms. of water will dissolve about 40.4 grms. of normal ammonium chromate, 47.17 grms. of ammonium bichromate, and 165.1 grms. of chromium trioxide.—A. S.

Trithionates; Reduction of —, to Sulphites by Arsenite or Stannite. A. Gutmann. Ber. 1905, 38, 3277—3281.

IN continuation of his researches into the reactions of other sulphur acids (this J., 1905, 618), the author now finds that when sodium trithionate is reduced by sodium arsenite, 1 mol. of trithionate yields 1 mol. of arsenate and 1 of sulphoxyarsenate, thus giving up one atom of sulphur and one of oxygen:—Typically, $S_3O_6 = 2SO_2 + S + O$; actually, $S_3O_6Na_2 + 2AsO_3Na_2 + 2NaOH = 2Na_2SO_3 + As_2SO_3Na_2 + As_2O_4Na_2 + H_2O$. Accordingly, the constitutional formula of the trithionate must be—

The reduction of trithionate by stannite takes place similarly. Dithionates are not affected by arsenite or stannite in alkaline solution.—J. T. D.

ENGLISH PATENT.

Carbonic Acid Gas Producing Apparatus. J. C. Stead, London. Eng. Pat. 26,659, Dec. 7, 1904.

THE invention is an improvement on Eng. Pat. 18,710, of 1904 (this J., 1905, 132), according to which a mixture of gases containing carbon dioxide is passed through a series of cylinders containing lye in which the carbon dioxide is absorbed, and is subsequently released by boiling, from the most highly saturated portion of the bicarbonated lye. Under the present invention, the "boiling-off" vessel is placed on a lower level than the connected vessels, so that it can receive its charge of bicarbonated lye through the action of gravity. The carbon dioxide expelled, passes upwards through a siphon tube to the bottom of a "lye-heating" vessel, below a screen which scatters and thus spreads the gas on its ascent. This latter vessel is charged with cool lye from the next absorbing cylinder to that from which the "boiling-off" cylinder is supplied, and this cool lye is thus warmed, and so heat, that of the hot carbon dioxide, is economised. The carbon dioxide is thus also, not only cooled, but completes the saturation of the lye within the vessel. From this vessel the gas passes to a reservoir. The lye, thus warmed and saturated, is then caused to flow through the siphon tube into the "boiling-off" vessel below; the contents of the latter having been previously discharged ready for recarbonating.

UNITED STATES PATENTS.

Lime and Lime-Containing Substances Process of Slaking —, and certain Novel Products of said Process. C. Ellis, New York. U.S. Pat. 802,354, Oct. 17, 1905.

THE lime is delivered from a hopper having a horizontal discharge pipe, furnished with a conveyor, and terminating in a vertical pipe, which delivers the lime into a chamber

in which a central horizontal shaft carrying paddles is rotated. In the roof of the chamber a perforated pipe, with valved connection to a water pipe, discharges upon the agitated lime a quantity of water approximately three-fourths to four-fifths of the quantity necessary for its complete hydration. From the hydrating chamber, the lime is projected into a lower and larger chamber, through which also a horizontal shaft passes, carrying agitators, and mechanically operated. The product is claimed as a "dry short-slaked lime." Compare U.S. Pat., 800,635, of Oct. 3, 1905; this J., 1905, 1109.—E. S.

Ammonia-Gas Condenser. A. H. Baer, Waynesboro, Pa. U.S. Pat. 802,904, Oct. 24, 1905.

THE condenser or cooler consists of several connected sets, each of three pipes, one within the other, with passages between their adjacent sides, the outside pipes being connected by fittings having openings leading from one set to the next, and an inlet and outlet at opposite ends of the passage. The intermediate pipe extends at each end considerably beyond the outer pipe, one end being tightly engaged with the fitting, beyond which it is closed; the other end, extending through the front fitting, is provided with a second fitting upon its outer end. The inside pipe, which leads through and extends beyond the intermediate pipe, communicates at one end with the annular space between it and the latter, and at the other end is connected by a tight joint with the fitting on the outer end of the intermediate pipe, this fitting opening into a chamber communicating with the said pipe, and having an open end communicating with the interior of the inside pipe. Branch pipes connect the inside pipes of adjacent sets.—E. S.

FRENCH PATENTS.

Sulphuric Acid; Manufacture of —. L. E. M. Brochon. Fr. Pat. 355,252, June 15, 1905.

THE main object of the invention is to burn sulphur (or pyrites) in excess of air under such pressure that the product may consist, in part, of strong sulphuric acid, and even, under favourable conditions, of the anhydride, at least in the early stage of the process, although sulphur dioxide is included among the products.

The drawing shows one form of apparatus in which the process may be conducted. Sulphur or powdered pyrites is admitted through the vertical tube S into the horizontal tube B, narrowed to a small aperture at b, and removably fitted to the wall of the chamber above E. Air under pressure (say, of 10 atmospheres) is forced through the tubes D and E; that through D carrying with it the powdered sulphur, and that through E traversing (and cooling) the annular space between B and the plug A, supplying excess of air to the sulphur which is inflamed beyond the exit b in the tube T. The acid vapours formed escape through the narrow channel in

the plug C at the farther end of the combustion tube, into condensing vessels, or into ordinary lead chambers of the sulphuric acid manufacture, the expansion of the gases on emergence sufficing to cool the vapours sufficiently without the intervention of special coolers.—E. S.

Hydrosulphites: Production of — *Dry and quite Stable.* Badische Anilin und Soda Fabrik. Third Addition, dated May 6, 1905, to Fr. Pat. 341,718, of March 28, 1904 (this J., 1904, 900).

ANHYDROUS zinc hydrosulphite is treated with a concentrated caustic soda lye, preferably heated, and the sodium hydrosulphite, free from water of crystallisation, thus obtained, is washed with alcohol, and dried *in vacuo* or over sulphuric acid at a temperature of 50° C. (See also First and Second Additions to the main patent; this J., 1905, 333.)—E. S.

Seaweed: Treatment of — *for the Extraction of Mineral and Organic Chemical Matters.* Mme. Lanreau, née J. H. Laureau. First Addition, dated May 24, 1905, to Fr. Pat. 352,069 of March 6, 1905 (this J., 1905, 892).

LIQUID from seaweed, whether lined or not, is treated with a solution of an alum, aluminium sulphate, or certain other salts, to precipitate fucose, which can be subsequently recovered from the precipitate by treatment with an acid. The liquid thus freed from fucose is concentrated, set to crystallise, and the mother liquors are treated to obtain iodine, &c.—E. S.

Sulphur Contained in Materials which have been used for Gas Purification; Process for Extracting and Purifying the — A. V. Cornillaux. First Addition, dated June 6, 1905, to Fr. Pat. 353,932, March 25, 1905.

Magnesium Chloride; Process for the Dehydration of — Salzbergwerk Neu-Stassfurt. Ger. Pat. 161,662, March 7, 1903.

THE magnesium chloride is heated *in vacuo* to a temperature of over 100° C.—A. S.

Antimony Oxide; Process for the Manufacture of — *from Antimony Sulphide and Sulphide Antimony Oxides.* S. Metz. Ger. Pat. 161,776, April 24, 1904.

THE finely-powdered antimony compound or ore is heated with sulphuric acid and an alkali sulphate, the solution is allowed to cool, and the crystals which separate are removed and boiled with water to obtain antimony oxide. It was found that the antimony of antimony sulphide, is quantitatively converted into antimony sulphate at a temperature of 130° C. by this method, the sulphur escaping as sulphur dioxide. The antimony crystallises out from the solution in the form of a double antimony-alkali sulphate, which, on treatment with boiling water, yields antimony oxide, sulphuric acid and alkali sulphate.—A. S.

IX.—BUILDING MATERIALS, CLAYS, MORTARS, AND CEMENTS.

(Continued from page 1110.)

"Diamantin": A Protecting Medium for Refractory Blocks. C. Loeser. Chem. Ind., 1905, 28, 643—647.

"DIAMANTIN" is used as a lining for ovens and furnaces, especially for the protection of parts against the attacks of ash, slag, molten metals, molten glass, lime, cement and similar bodies. It is produced, at the temperature of the electric arc, from aluminium oxide with a small addition of silica. For use it is mixed with a little highly-refractory plastic clay and water to a more or less thin paste, which is spread upon the refractory blocks, to which it adheres quickly forming a tough covering that cannot be easily removed when once subjected to fire.

To test the efficacy of "diamantin," small oblong blocks were prepared on one of the broader faces of which a shallow oblong indentation was made. The blocks were made of the finest washed kaolin with about 36 per cent. of unburnt Dölau clay, mixed with an equal amount of broken saggars, ground to about 3 mm. grain, and burnt at 1430° C. The indented faces of a number of these were coated with a layer of "diamantin" $\frac{1}{2}$ to 1 mm. thick, and four series of tests were made.

In the first series the indentations of some protected and unprotected blocks were half filled with ash of brown-coal, and raised three times to about 1450° C. In the unprotected tests a dark, greenish-black, porous, lava-like mass formed, which had eaten into the corners of the hollows, and ramified into the pores. The bottom of the protected hollows was covered with an uneven thick fused mass, in which were imbedded some more refractory particles.

The test pieces for the second series were similarly prepared and treated, but a piece of lime 2×2×4 cm. was placed on the ash of brown-coal. The main results on burning were that with the unprotected tests the layer of ash was absorbed, the lime being burnt to a greenish-black clinker, which was cemented to the base of the hollow; but with the protected tests the ash showed hardly any sign of melting or glazing, and the lime could be easily lifted out. "Diamantin" should, therefore, be valuable as a lining for rotary kilns.

In the third series of tests the effect was tried of the following mixture, corresponding with Seger cone No. 010., and melting at 950° C.

0.3 K ₂ O	0.2 Fe ₂ O ₃	3.5 SiO ₂
0.7 CaO	0.3 Al ₂ O ₃	0.5 B ₂ O ₃

In the unprotected tests, the molten glaze penetrated into cracks and pores of the block, and formed difficultly fusible silicates with portions of it. The layer between glaze and block was of a milky opaque appearance. In the protected test there was no penetration of the block by the molten glaze, which was separated from the block by a lava-like layer with a fine-pore structure.

In the fourth series of tests a mixture, fusing with difficulty, corresponding to Seger cone No. 10, was used:—

0.3 K ₂ O	1 Al ₂ O ₃	10 SiO ₂
0.7 CaO		

In the unprotected tests the mass formed a fused mass, too viscous to reach the edges of the hollow, and with soft ascending edges, which could be chiselled off the block only with much more difficulty than the cake formed in the hollow protected with diamantin, which had much steeper edges.—W. C. H.

ENGLISH PATENT.

Cement Making: Rotary Kilns for — E. Gobbe, Jumet, Belgium. Eng. Pat. 27,753, Dec. 19, 1904.

FRENCH PATENTS.

Marble, Granite, &c., Manufacture of Artificial — L. Lefranc. Fr. Pat. 355,222, May 23, 1905.

A MIXTURE in molecular proportions of fluor spar with gypsum (or calcium carbonate, clay, sand or other alkali or alkaline earth oxides) is fused in a suitable furnace at a temperature of 1000° to 1500° C. until perfectly homogeneous, then run into closed and heated moulds and cooled very slowly. To imitate marble, colouring bodies such as ferric oxide or copper salts are added to the mass at the moment of cooling; for granite, hard graphite or carborundum is added in the same way. The moulds are carried on trucks which are worked in a tunnel leading from the mouth of the furnace, and through which the hot waste gases are made to pass, heating the moulds in so doing.—A. G. L.

Fibres, Films, Blocks or Slabs; Plastic and Transparent Substance for the Manufacture of — H. C. M. L. Cathelineau and A. A. René-Fleury. Fr. Pat. 354,912, June 5, 1905. V., page 1169.

Lime, Cement and Puzzuolana; Manufacture of — Soc. Anon. des Chaux et Ciments Romain Boyer. Fr. Pat. 355,132, June 10, 1905.

TO the raw materials before burning are added either polybasic acids, e.g., sulphuric, sulphurous, phosphoric, or boric acid, or substances capable of forming such acids during the subsequent burning, e.g., sulphur or phosphorus.

—A. G. L.

Cement-Kiln; New Form of

Soc. J. B. Lemaitre et Cie.

Fr. Pat. 355,183, June 23, 1905.

THE kiln is characterised by having a conical grate placed in the centre of the hearth. Air is admitted through this grate, being supplied by horizontal channels, provided with dampers, in the base of the kiln. Discharge openings for the burnt material are placed on a level with the bottom of the kiln, and passages leading to openings higher up in the kiln are provided, by means of which air is made to pass over the burnt material, cooling the latter, and itself becoming heated in so doing. The action of the kiln is continuous, raw materials being charged in through openings near the top, the burnt gases escaping through other openings in the same part of the kiln. Coal, poor in quality, or other fuel, is used, and it is claimed that a saving of more than 35 per cent. in labour, fuel, &c., is effected by using this form of kiln.—A. G. L.

Steel; Production of — with use of ready-formed Slag. O. Goldstein. Stahl u. Eisen, 1905, 25, 1230-1231.

WITH ores containing too much phosphorus for the Bessemer and too little for the Thomas process, steel production by the basic Martin process is very slow, because of the large amounts of ore, and of flux for the sulphur and phosphorus in this ore, that have to be added to the bath. Such ores are successfully dealt with, in Mexico and the Southern States of North America, by the duplex process, combined with Knuth's slag process. The pig, containing 1 per cent. of phosphorus, is treated in the acid converter (or, with scrap, in a basic Siemens-Martin furnace) till the carbon is reduced to about 1 per cent. It is then poured into a basic Siemens-Martin furnace, containing the slag from a former operation, lime added to make up for the loss of slag during pouring, and a little felspar. Reaction sets in at once, and the charge of 30 tons is finished in 2½ hours. With a tilting furnace, the slag may remain in during the whole time; with a fixed furnace, it must be poured out and replaced after pouring the steel. The finished steel contains only 0.006 to 0.012 per cent. of phosphorus.—J. T. D.

Steel Ingots; Segregation in — B. Talbot. Iron and Steel Inst., Sept., 1905. [Advance Proof.]

IN order to determine the effect of aluminium in hindering segregation, the author carried out a series of parallel tests on ingots from the same "heat," with and without

the addition of a small amount of aluminium. The ingots were taken from both acid and basic open-hearth furnaces, and varied in weight from $1\frac{1}{2}$ to $3\frac{1}{2}$ tons; the smaller ingots showed the effect of segregation quite as distinctly, if not more so, than the larger ones. The results are given in a series of tables. It was found that, as a rule, in ingots (5 ft. 6 in. high) to which no aluminium had been added, excessive segregation down the central line of the ingot occurred from about 6 in. from the top to about half-way down; sulphur showed the greatest tendency to segregate, followed by phosphorus and carbon, whilst, in the case of manganese, the segregation was so slight as to be almost negligible. By the addition of aluminium (3–4 oz. per ton), ingots of much more uniform composition were obtained. The effect of the aluminium was shown very distinctly in the case of two acid steel ingots, each 18 in. by 22 in. by 67 in., and weighing 6000 lb. The ingots were "top-poured," and to one, an addition of 4 oz. of aluminium per ton was made. The metal in the ladle, before the addition of the aluminium, contained 0.38 per cent. of carbon, 0.061 per cent. of sulphur, 0.052 per cent. of phosphorus, and 0.52 per cent. of manganese. The amount of segregation of the sulphur in these two ingots is shown in the accompanying diagram. The lighter shaded portions represent areas on the surface of the ingot when cut through longitudinally, in which the percentage of sulphur has increased more than 25 per cent. over the amount shown by the ladle test, whilst the darker shaded portion represents an increase of 75 per cent. over the ladle test. The drillings for analysis were taken at the points where the vertical and horizontal lines intersect, and where the amount of sulphur was above the limit, the borders of the area to be shaded were taken half-way between such point and the nearest point where the amount of sulphur was below the limit. A point of some importance brought out in the course of the experiments was the uniformity in the percentages of carbon in fairly high carbon basic steel, obtained by the addition of solid carbon to the steel while running into the ladle. It is generally held that the addition of small amounts of aluminium causes a marked increase in the fluidity of molten steel, but the author's experience is that aluminium makes the metal set more quickly. In fact, the setting effect on the top of the ingot is so marked that at one works, at which it is the custom to add aluminium regularly, the ingots are never sanded over or stoppered down, no such treatment being necessary either with acid or basic open-hearth steel. When the aluminium is added to the metal as it is run into the ladle, the effect is not so pronounced as when the addition is made to the molten metal in the ingot mould.—A. S.

Nickel Steel; Reversible and Irreversible Transformations of —. L. Dumas. Iron and Steel Inst., Sept., 1905. [Advance Proof.]

THE discovery by Hopkinson in 1889 of the irreversible transformation of a 25 per cent. nickel steel remained for long an isolated fact. Osmond discovered that other nickel steels exhibited similar phenomena, and Guillaume showed that the transformation point on cooling became lower as the percentage of nickel rose from 0 to 25, and that above that percentage the transformation (occurring now at a higher temperature as the nickel increases) is reversible. Osmond (this J., 1899, 278) determined the transformation points on heating and cooling of steels with all percentages of nickel, and expressed his results in curves, which show that as the nickel rises, the irreversible points are lowered, and the range between the heating point and the cooling point increases; that just above 25 per cent. of nickel reversible transformation occurs at about the same temperature as irreversible transformation on cooling just below that percentage; and that the reversible transformation point rises (heating and cooling points, of course, close together) to a maximum at 70 per cent. of nickel, and then gradually falls.

The author points out that carbon produces, twentyfold as strongly as nickel, depression of the irreversible transformation point—in Osmond's austenite-steel transformation occurs at -150°C . High proportions of carbon, however, readily segregate in an iron-carbon steel, whilst if nickel be present it more readily remains uni-

formly distributed, and the presence of nickel (itself acting in the same direction) does not sensibly modify the effect of the carbon in lowering the irreversible transformation point. Carbon has no effect on the reversible transformation, and by using nickel steels high in carbon and thus greatly lowering the irreversible point, the author has shown that steels below 25 per cent. of nickel exhibit reversible transformation, and that Osmond's curve can be continued towards the zero of nickel, crossing the curve of irreversible transformation. With low-carbon steels, the magnetism due to the reversible transformation is, if the nickel be below 25 per cent., masked by the stronger effects of that due to the irreversible transformation.

Manganese acts similarly to nickel and carbon, and is intermediate in the intensity of its action. The points of transformation of two manganese steels, containing respectively manganese 8.29, carbon 0.06, and manganese 10.83, carbon 0.29 per cent., are 175°C . and -78°C . In the absence of nickel, manganese steels show no reversible transformation.

The reversible and irreversible transformations appear to be distinct phenomena, and it seems that neither is definitely limited by a fixed percentage of nickel, and that irreversible transformation is exhibited by steels with more than 25 per cent (though unless the carbon and manganese are very low the transformation-point is impracticably low for demonstration), and reversible transformation by those with less. The reversible transformation produces but a weak degree of magnetism, and has practically no influence on the mechanical properties of the steel.

Chromium produces, in nickel carbon steels, a considerable lowering of the irreversible point; but it seems to have little intrinsic effect, but to increase the activity of the carbon, for its effect diminishes with the amount of carbon present. It no doubt acts as a solvent of carbon, favouring the diffusion of the carbon through the steel. Mechanically, also, it seems to act on the nickel, and to improve the quality of the steel.

The irreversible transformation has an important effect on the mechanical properties of the steel; it can be studied either by examining the steel at varying temperatures or by varying the percentage of nickel and working at the same temperature. (In all cases it is to be remembered that transformation is completed not at a point but over a zone of temperature.) A 16 per cent. nickel steel, heated to 700°C ., and placed on a lathe while above 150°C ., can be turned readily, but below that temperature becomes hard and brittle, and at the same time magnetic. The following figures show the differences in mechanical properties due to transformation, and also those due to "working." The first two are a low-carbon steel, with transformation-point above the ordinary temperature, and a high-carbon steel of the same nickel-content, with transformation-point below it. The first is deformed at one place only, the second undergoes preliminary deformation along its whole length, and only after that a deformation at the point of ultimate fracture. The elastic limits are respectively 87 and 42 per cent. of the tensile strength, and the preliminary deformation in the second case is a kind of "working," producing results similar to the various kinds of working instanced further down the table. These two steels (A) and (B) contained, respectively, carbon, 0.16, 0.53; manganese, 0.13, 0.83; chromium, 0.0, 3.02; nickel, 15.92, 16.05 per cent.

Kind of Steel.	Elastic limit.	Tensile strength.	Elongation.	Contraction.
	Kgrms per sq. mm.		Per cent.	Per cent.
Magnetic (A) . . .	76.2	89.2	19.0	54.5
Non-magnetic (B) . . .	32.8	77.5	73.0	68.0
25 per cent. nickel				
Before drawing	32.1	57.8	34.0	55.0
After drawing	92.1	92.1	11.7	63.5
23 per cent. nickel				
No treatment	30.9	71.8	35.0	41.5
Cooled at 78°C .	102.6	137.0	20.3	21.5
Drawn	123.5	139.0	12.3	28.2
Drawn & cooled	141.5	149.0	12.7	32.1

In all these cases, not only is the tensile strength increased by working, but the elastic limit is made more nearly to approach it. Irreversible transformation thus produces a similar effect to working.

Irreversible transformation on cooling is accompanied by a sudden increase in volume. This is probably a molecular increase, the molecules having lost the facility of slipping over one another, as though subjected to pressure. No doubt the nickel molecules compress those of iron, and the "working" effect increases the elastic limit, till, above 20 per cent. of nickel, the iron changes its state, the volume of the molecules diminishes, pressure is relieved, and ductility reappears. Micrographic examination shows that a polished sample of nickel steel, which has been cooled so as to partially transform it, exhibits projections in the transformed portions, which have become martensite. Other physical properties are also changed during transformation. Reversible transformation, though it has no noticeable effect on the mechanical qualities of the steel, modifies many of the physical properties, especially, as has been shown by Guillaume, the dilatation and the elasticity.

Tests of tensile strength of steels with varying amounts of nickel show that the elastic limit and tensile strength both increase as the nickel increases up to 15 per cent., but above that the elastic limit decreases, though the tensile strength still increases, till 21 per cent. is reached; above which amount both undergo a sudden fall, and the elongation rapidly increases. About this percentage the transformation-point on cooling falls below the ordinary temperature. Above 27 per cent. of nickel very slight alterations in the mechanical qualities occur.

Physical treatment—annealing, quenching, or working—raises the irreversible transformation-point of steels which have it about the ordinary temperature. Determinations on a number of steels after quenching and working show that those with more than 21 per cent. of nickel undergo a rise which may bring the cooling point almost up to the heating point, itself slightly raised, while those containing 15–21 per cent. are hardly affected (being, so to speak, already "worked," as they have at the ordinary temperature undergone the transformation), and those with less than 15 per cent. have the two points slightly lowered but not approximated. Physical treatment produces similar effects on the mechanical properties of nickel steels; that is to say, those which at the ordinary temperature have undergone transformation are insensitive, while those not transformed are very susceptible to alteration. The effect on such steels of working is to raise the elastic limit and lessen the elongation; this may occur even to a greater extent than through transformation by cooling, but the stresses so produced are (unlike those due to transformation) irregularly distributed, and chiefly confined to the outer layers, and they are entirely destroyed by annealing at 900° C. Quenching from 800°–900° C. somewhat hardens transformed steels, but softens considerably those not transformed. In the case of carbon steels, quenching alters the distribution of the carbon, and thus the chemical composition, and its effects are destroyed by heating to a temperature high enough to allow the inverse change to take place; but with nickel steels the change seems to be physical, and the resulting state is stable enough to stand successive re-heatings, and even to be accentuated by repeating the treatment. Annealing at 900° C. produces effects similar to quenching, but less marked. Annealing at 400° C. softens nickel steels with high elastic limits, as it does quenched carbon steels. The effect produced depends on whether or not the steel is raised to a temperature above its transformation point; in the first case it becomes non-magnetic, and its hardness is increased, but in the second it remains magnetic throughout, and its hardness is diminished.

The author considers that the untransformed steels contain γ -iron, and that the irreversible transformation is due to the formation of β -iron, accompanied by the appearance of internal stresses, a certain proportion of α -iron being at the same time formed, to which alone the magnetic properties are due.—J. T. D.

Gas from Gas Producers, Blast-Furnaces and the like; Method of and Apparatus for Purifying the —. J. D. Thornycroft, and J. I. Thornycroft and Co., Ltd., Eng. Pat. 28,295, Dec. 23, 1904. II., page 1164.

Steam from Hot Slag; Apparatus for Generating —. G. Mitchell, Los Angeles, Cal. Eng. Pat. 2795, Feb. 10, 1905.

THE claim is for improvements in apparatus described in Eng. Pats. 20,225 and 26,795 of 1902 (this J., 1903, 302), and consists in combining a rotary slag carrier with the steam generator. The slag carrier consists of a drum rotating in a steam-jacketed casing mounted above the steam generator, and provided with radial slag chambers alternating with radial steam chambers. The contact between the drum and the casing is made tight by split rings forced against the casing by steam admitted to the radial steam chambers. The steam is conveyed to the chambers in the drum by a hollow shaft on which the drum rotates. As the radial slag chambers come into the highest position they pass under a hopper from which they are filled with slag. When in the course of rotation they reach the lowest position they are opposite the opening into the steam generator; at this point steam enters the chamber from the hollow shaft and forces the slag into the generator.

Iron, Ingot-Steel, &c.; Process for the Deoxidation of Ingot —. R. Eichhoff, Essen-Rüttenscheid, Germany, Assignor to Elektrostahl Ges.m.b.H., Remscheid-Hasten, Germany. U.S. Pat. 801,656, Oct. 10, 1905.

THE metal is smelted and purified in a Bessemer, Thomas, or other furnace, separated from the slag, and then covered with a layer of neutral slag in another receptacle. The molten metal is cooled to just above its solidifying point, reducing agents are added to reduce the oxidation products which have separated from the metal and passed into the slag, and the metal is then again heated while still under the neutral slag, mixed if desired with a suitable substance to form an alloy, and cast.—A. S.

Steel, Armour Plates, &c.; Method of Treating —. R. A. Hadfield, Sheffield. U.S. Pat. 802,188, Oct. 17, 1905.

SEE Eng Pat. 15,220 of 1904; this J., 1905, 736.—T.F.B.

Precious-Metal-Bearing Materials; Process of Treating —. C. W. Merrill, Lead, S.D. U.S. Pat. 801,470, Oct. 10, 1905.

THE substance is crushed, and the pulp after being freed from any liquid contained in its interstitial spaces, is treated first with compressed air and then with a solution containing cyanogen.—A. S.

Furnace; Zinc-Smelting —. E. C. Hegeler, Lasalle, Ill. U.S. Pat. 794,799, July 18, 1905.

THE invention relates to that class of Belgian zinc-smelting furnaces in which the retorts are arranged transversely in a horizontal flue or chamber of great length. The improved apparatus claimed is shown in Figs. 1 and 2. Fig. 1 is a sectional plan of the entrance end of the retort chamber, together with a portion of the gas flue. Fig. 2 is a sectional elevation on the line 2-2 of Fig. 1. The long horizontal retort chamber is divided into two compartments A, A by the central wall A¹, which is provided with steps on which the rear ends of the retorts B rest. The retorts are arranged in horizontal and vertical rows;

the distance between the retorts in the horizontal rows is ordinarily about 2 ins., but at intervals the rows are placed further apart, so that groups of retorts are formed with intervening vertical spaces, *a, a*. The roof of the retort chamber is formed of a series of high sections or arches *C*, alternating with low sections or arches *C*¹, the high sections forming a series of recesses, in which no retorts are placed. The bottom or floor of the chamber is flat except at the points directly below the recesses in the roof, where it is provided with ridges *C*², preferably formed of heaps of sand, the apex of the heap being a little below the underside of the lower row of retorts.

FIG. 1.

FIG. 3.

These ridges form a series of recesses in which also no retorts are placed. The generator-gases used as fuel enter the gas flue leading to the entrance end of the retort chamber through the passage *E*¹ and pass through a contracted passage *e*¹ *e*¹ in the opposite sides of which are air inlet openings *e*² *e*², through which is supplied nearly the whole of the air required before the gases enter the retort chamber. The mixture of gas and air passes into the vertical portion *E*² of the gas flue, which it descends and then passes through openings *e*³ *e*³ into the retort chamber, additional supplies of air being provided through smaller inlets *e*⁴ placed just before the first row of retorts. The air supply to the retort chambers enters through inlets opening into the vertical spaces *a, a*. The air inlet device is shown in Fig. 3, where *F* is the air-inlet pipe receiving air from the main *F*¹ (see Fig. 2). The pipe *F* (Fig. 3) is provided with openings in its inner side having flanges *f*, and similar openings in its outer side closed by a sliding door *f*¹. The opening in the flange *f* opens into a short burnt fire-clay tube *G*, which is fixed by means of fire-clay in a hole *f*³ in the fire-brick wall of the retort chamber. This tube *G* projects a short distance into the retort chamber; it is closed at the end *g*, but has a side opening *g*¹. The amount of air admitted is regulated by a removable sheet-iron stopper *G*¹ with a slot *g*², which is inserted into the flange *f* at its junction with pipe *F*.—A. S.

FIG. 2.

Pyrrhotite; Method of Separating — from Chalcopyrite and Gangue. J. N. Judson, South Stafford, Vt., U.S. Pat. 801,879, Oct. 17, 1905.

ORES containing non-magnetic or slightly magnetic varieties of pyrrhotite, associated with chalcopyrite and gangue minerals, are heated to such a degree that the particles of pyrrhotite acquire "a surface iridescence or film of rainbow colours," and become more magnetic than the chalcopyrite, without any considerable loss of sulphur. The pyrrhotite is then separated from the heated ore by magnetic attraction.—A. S.

Furnace. J. A. Herrick, Philadelphia. U.S. Pat. 802,102, Oct. 17, 1905.

THE furnace contains a heating chamber; a number of regenerators at each end, arranged transversely to the chamber; a number of separate gas passages connected with each end of the heating chamber and extending downwardly between the regenerators; a separate slag pocket connected with the bottom of each passage and separated from the connections of same with the corresponding regenerator; a number of air passages connecting each end of the heating chamber with different parts of the regenerators; and separate ports connecting one of the regenerators with the gas passages above the slag pockets, the heating chamber being supported at its respective ends by only one of the regenerators.—C. S.

Furnace; Tilting — E. H. Treat, Pittsburg, Pa. U.S. Pat. 802,151, Oct. 17, 1905.

THE furnace is supported by a framework of transverse beams secured to longitudinal girders resting on curved end rockers. The latter engage with guide-rollers which hold the furnace in position and cause it to tilt as the rockers move. The rockers are actuated by racks carried by movable hollow box-girders or beds resting on horizontal sets of rollers.—A. S.

Furnace; Drying and Roasting — C. E. Ballow and E. Stein, Guanacevi, Mexico. U.S. Pat. 802,191, Oct. 17, 1905.

THE furnace is provided with a drying stack having a discharge into the atmosphere at the upper end, and an ore discharge at its lower end; a roasting stack with an ore discharge at the lower end; a downtake flue passing from the top of the roasting stack to the base of the drying stack; means for heating the roasting stack, and an auxiliary heater at the base of the drying stack; corrugated agitating rollers (with means for operating same) mounted in the drying and roasting stacks; shelves mounted in the stacks and projecting between the rollers, some of which latter have tubular axles projecting through the stack walls to permit the circulation of a cooling medium between the axles.—C. S.

Nickel and Copper Sulphides; Method of Separating — A. Monell, New York. U.S. Pat. 802,012, Oct. 17, 1905.

A MATTE containing metallic sulphide is treated in an open-hearth furnace with a material (e.g., sodium sulphate and a reducing agent), which acts as a solvent for some of the sulphides present, and the mixture is heated to the fusing point of the solvent. The fused mass is "poled" or agitated until practically the whole of the soluble sulphides has been dissolved, and the insoluble sulphides are allowed to settle, and are then removed.—A. S.

Nickel-Copper Matte; Method of Treating "Copper Tops" in the Refining of — R. P. Maffett, Bayonne, N.J., Assignor to the International Nickel Co., New York. U.S. Pat. 802,148, Oct. 17, 1905.

"COPPER-IRON tops," containing sulphides of copper and iron and an alkali sulphide are "weathered" in order to oxidise the alkali sulphide to sulphate. The material is then heated in an oxidising atmosphere, the fused alkali sulphate is separated by gravity, and the residual copper is heated and refined.—A. S.

Oxides; Process of Reducing Metallic — T. S. Blair, Jun., Woodmere, N.Y., Assignor to B. C. Lauth, Pittsburg, Pa. U.S. Pat. 802,493, Oct. 24, 1905.

THE metallic oxide mixed with gangue is kept in motion

so that all the particles of oxide are brought successively to the surface, and the moving material is treated with a reducing gas at a temperature sufficiently high to bring about the desired reaction, and with a supply of free oxygen insufficient to consume the reducing agent. The "reducing temperature is then changed to a non-reducing one" by increasing the supply of air, and the temperature is raised to a degree sufficient to fuse the gangue or extraneous matter and "burn out" the metalloids, but not to fuse the reduced metal. The metal is finally "balled" together and the fused gangue separated.—A. S.

Oxides; Process for the Reduction of Metallic —, and the Separation of the Resulting Metals. A. J. Rossi, New York, Assignor to J. MacNaughton, Tahawus, N.Y., and P. C. Peck, New York. U.S. Pat. 802,941, Oct. 24, 1905.

THE first step in the process consists in the preparation of a bath of a molten reducing metal, the oxide of which has a heat of formation at the working temperature greater than that of the metallic oxide under treatment. Aluminium is mentioned as a suitable reducing metal, and the bath must be free from iron or other foreign metals. The metallic oxide under treatment is immersed in the bath of molten metal and the mass is maintained at a suitable temperature, until the reduced metal has segregated and separated from the other constituents of the mixture.—A. S.

Cementation of Steel, Iron, &c.; New Process of Rapid — J. Lecomte. Third Addition, dated May 8, 1905, to Fr. Pat. 327,984, June 6, 1902.

THE cemented billets, &c., after complete cooling are reheated to a temperature between 950° C. and 1100° C. according to their character, and then plunged into cold water or other tempering liquid; or the pieces are heated to about 1050° C., left to cool to between 800° C. and 850° C., and finally tempered in a cold liquid.—J. H. C.

Nickel and Cobalt; Separation of — J. Bernard. Fr. Pat. 354,941, June 5, 1905.

COBALT is precipitated as pure peroxide from solutions containing nickel by means of a solution of a hypochlorite previously neutralised and freed from alkali carbonates and caustic alkalis. In the case of liquors poor in cobalt, the hypochlorite is used in excess together with calcium carbonate or magnesium carbonate, so as to precipitate the whole of the cobalt with some nickel. This precipitate is dissolved in acid, and the greater part of the cobalt is reprecipitated, the hypochlorite being now used in such quantity that the chlorine present is insufficient to cause the peroxidation of the whole of the cobalt.—J. H. C.

Minerals; Concentration of — by Means of Water and Air. H. L. Sulman, H. F. K. Picard and J. Ballot. Fr. Pat. 354,959, June 5, 1905.

THE finely-powdered mineral is freely exposed to air, and then spread over the surface of a current of water, preferably acidulated, when the mineral particles float, while the greater part of the gangue sinks. The upper layer of water with its burden of enriched mineral is passed on to a shaking table, where it is treated with jets of air whereby a further separation is effected.—J. H. C.

Minerals; Concentration of — H. L. Sulman, H. F. K. Picard and J. Ballot. Fr. Pat. 354,969, June 5, 1905.

THE finely-pulverised mineral, while suspended in acidulated water, is agitated with a small proportion of some oily substance containing oleic acid equal to a fraction of 1 per cent. of the weight of mineral, until it forms a sort of scum which can be separated from the gangue, heat being sometimes employed to assist this operation. In some cases the whole mixture is subsequently passed through hydraulic separators whereby the sands and earthy matters are further separated, after which the mineral scum is further concentrated by alternate exposure to air and water on a shaking table.—J. H. C.

Water from the Washing of Coal, Minerals, &c.; Process for the Clarification of Residual — F. Baum. Fr. Pat. 355,097, June 8, 1905. I., page 1162.

Cupolas and Other Similar Wind Furnaces; Water-Jacket for — C. W. Hawkes and F. Klepetko. Fr. Pat. 354,983, June 6, 1905.

THE water-jacket is formed of an outer and an inner plate, held together by tie-rods or bolts, the plates being kept apart by distance pieces placed between them. The tuyère blocks pass through the water-jacket from plate to plate, the joints being made by a ring or by turning the ends of the tuyère tubes over the plate.—W. H. C.

Metallic Cables; Process of Rendering — Non-oxidisable. M. Audian. Fr. Pat. 355,331, June 17, 1905.

CLAIM is made for the application of a coating of iron silicate to bright or galvanised metallic cables or polished metal surfaces in general, by immersing the metal in an aqueous solution of borax and ferric oxide and subsequently treating it with sodium or potassium silicate or fusible basic scorix.—C. A. M.

GERMAN PATENT.

Metals; Process for the Manufacture of Alkali, Alkaline-Earth, Earth and Heavy — or of Alloys of these Metals. J. Malovich et Cie. Ger. Pat. 161,428, April 8, 1903. Addition to Ger. Pat. 159,632, Aug. 14, 1902 (this J., 1905, 738).

ACCORDING to the present patent the oxide or salt of the metal to be reduced, is heated with a mixture of the sulphate or sulphite of the same metal and sulphur; or the sulphate or sulphite of a metal alone is heated with sulphur. For example, sodium is produced by heating sodium carbonate and sodium sulphate with sulphur, and calcium in a similar manner from calcium oxide, calcium sulphate and calcium sulphide. Barium can be obtained by heating 100 parts of barium sulphate with, at least, 40 parts of sulphur for seven hours at about 1800° C. According to one claim, a crucible is charged with a mixture of sulphur and the sulphate or sulphite of the metal, and is strongly heated, and the gases and vapours evolved, are led through the oxide or salt of the metal contained in another crucible.—A. S.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

(Continued from page 1117.)

(A.)—ELECTRO-CHEMISTRY.

Electrolysis with Alternating Currents, and Passive Copper. M. Le Blanc. Z. Elektrochem., 1905, 11, 705–708.

WHEN an alternating current is passed through a solution of copper sulphate between copper electrodes, no change occurs if the alternations are symmetrical. With asymmetrical currents up to 15500 \times per minute, one electrode is found to gain as much as the other loses. This, however, only holds when both electrodes have a crystalline surface. On heating an electrode to incipient fusion and plunging it into alcohol, the copper becomes superficially passive, and no longer goes into solution as a bivalent ion, according to Faraday's law. The copper deposited on a passive electrode by asymmetrical alternating currents is itself passive, whereas that deposited by direct currents is normal. Passive copper shows a P.D. of 0.013 volt, against normal copper in copper sulphate solution. Prolonged treatment with alternating currents in potassium cyanide solution restores passive electrodes to the normal or crystalline condition.—W. A. C.

Zinc and Manganese as Anodes. W. J. Müller. Z. Elektrochem., 1905, 11, 755–763.

ANODES of zinc or manganese behave normally in acid or neutral electrolytes. In alkaline sodium sulphate or phosphate baths they become markedly passive. The author's experiments favour the theory that passivity is

here due not to a non-conducting layer on the electrode, but to the formation of a modification of the metal which has a higher electrochemical valency than the normal one.—W. A. C.

Arc; Self Regulating Apparatus for Submitting Gases and Vapours to the Action of the Electric — A. A. Naville, P. A. Guye and C. E. Guye. Fr. Pat. 350,120, Aug. 17, 1904.

THE apparatus takes the form of what is called an "electric flue," the draught of the gases up a vertically placed tube being occasioned by the heat of the arc. The arc itself plays between horn-shaped electrodes, similar to some forms of lightning arresters, placed in these cylinders. The upward current of the gases blows the arc up the electrodes from the points *bb*, between which it is struck, towards *aa*. The position along the electrodes between which the discharge at any instant takes place, depends upon the voltage available at that moment. Fig. 1.

It is preferable to arrange several arcs electrically in series, but to have the "flues" carrying the gases in parallel.—R. S. H.

Ozoniser; Electric — C. A. Sahlström. Fr. Pat. 355,411, June 20, 1905. Under Int. Conv., June 21, 1904.

THE apparatus is of the type in which the two electrodes are formed of metal foil on opposite sides of a plate of glass.

or other dielectric. To insure good contact and prevent the production of sparks, the metal foil has a large number of small tongues stamped out from its surface and turned down so that the points touch the dielectric with which they can be kept in contact by slight pressure.—R. S. H.

(B).—ELECTRO-METALLURGY.

Calcium; Electrolytic — J. H. Goodwin, Proc. Amer. Philos. Soc., 1904, 43, 381—392. Chem. Centr., 1905, 2, 1154—1155.

For the electrolytic preparation of metallic calcium, the author used as anode a tall cylindrical vessel of Acheson graphite, on the bottom of which, insulated from the graphite by asbestos, were copper cooling tubes, so that the lowermost layer of calcium chloride was prevented from melting. The cathode was a $\frac{1}{2}$ -in. iron rod provided with a screw, by means of which it could be raised or lowered. The calcium which first separated on the iron rod, acted as cathode during the remainder of the electrolysis, and by gradually raising the iron rod, sticks of calcium were obtained, protected from oxidation by a coating of calcium chloride. In six experiments with 17.7 volts and 163 ampères, an average current-yield of 26.6 per cent. of calcium was obtained; the maximum current-yield was 41.2 per cent. with 19 volts and 160 ampères in six hours. The separated metal had the following composition:—Silicon, 0.03; iron, 0.02; aluminium, 0.03; calcium, 98.00; magnesium, 0.11; chlorine, 0.90; and oxygen (by difference), 0.91 per cent. One stick of calcium obtained, was 56 cm. long, had a diameter varying between 3.2 and 8 cm., and weighed 295 grms. The temperature of the electrolyte must be kept within narrow limits, so that the metal is separated in a fused and not a spongy condition, and adheres to the cathode firmly enough to be withdrawn from the bath without breaking.

By melting together several sticks of calcium in a well-cleaned iron tube, and afterwards cooling, reddish-violet cubical crystals were obtained, having the sp. gr. 1.5425 at 28.1° C., and possessing the following composition:—Gangue matter, 0.03; silica, 0.77; ferric oxide, 0.46; alumina, 0.77; calcium, 91.28; magnesium, 0.11; chlorine, 1.28; carbon and nitrogen, traces; and oxygen (by difference), 5.30 per cent. The crystals were very soft and could be hammered into sheets as thin as paper, but frequently exploded under this treatment. They showed a lustrous fracture, the freshly-cut surface having a somewhat yellowish tinge. The metal can be heated to redness without burning, but does not harden when quenched in water; at 300°—400° C. it is as soft as lead. Its specific resistance is 3.43 microhms per c.c. at 0° C., with a temperature coefficient of 0.00457. It has a tensile strength of 612 kilos. per sq. cm., and an extension of 23 per cent. for 1 cm., 15 per cent. for 2 cm., 11 per cent. for 3 cm., and 6.6 per cent. for 5 cm. Calcium is harder than sodium, lead and tin, almost as hard as aluminium, but softer than zinc, cadmium and magnesium.—A. S.

ENGLISH PATENT.

Vanadium; Process of Obtaining Metallic — from its Ores or other Vanadian Compounds. P. Auchmachie, Wrexham, North Wales. Eng. Pat. 22,422, Oct. 18, 1904.

THE ore is digested with sulphuric acid, in some cases with addition of sodium nitrate, and the diluted and cleared solution is electrolysed to obtain vanadium oxide; or it is treated chemically. In the latter case, the suboxide obtained, by nearly neutralising the solution with sodium carbonate, is boiled with sulphuric acid with addition of sodium nitrate, to obtain the pentoxide. Whichever oxide is obtained, it is mixed with carbon, and heated to about 2000° C. in an electric or other high temperature furnace, to obtain metallic vanadium, which may be freed from carbon by grinding and washing with water. (Reference is made to Eng. Pat. 12,727, of June 6, 1904; this J., 1904, 986.)—E. S.

UNITED STATES PATENT.

Metals [Aluminium]; Process of Reducing —, and Making Alloys. H. S. Blackmore, Mount Vernon, N.Y. U.S. Pat. 802,153, Oct. 17, 1905.

THE material is fused by passing through it an alternating heating current, which is not capable of separating the metal, and the metal (aluminium) is separated by means of another current passed through the fused material in a path disposed at an angle to the path of the heating current.—A. S.

ERRATUM.—This J., 1905, 1116, col. 2, l. 11 from bottom, add the name of Patentee, "H. H. Chance, Pa., U.S."

FRENCH PATENTS.

Furnace; Electric — Soc. Anon. Électrométallurgique (Procédés Paul Girod). First Addition, dated May 22, 1905, to Fr. Pat. 350,524 of Jan. 4, 1905 (this J., 1905, 739).

THIS addition to the previous patent consists in employing the vat or the exterior metallic hooping as one of the poles, the stonework being pierced with channels which connect the external metallic armature with the interior of the furnace. The outside armature is cooled in any convenient manner, in order to solidify the metal in the channels, or the latter may be previously filled with metallic powder or fragments, so that the metal may solidify in the interstices of the material.—B. N.

Furnaces; Impts. in Electric Arc — Soc. Anon. de Métallurgie Electro-Thermique. First Addition, dated May 26, 1905, to Fr. Pat. 339,593 of Jan. 14, 1904 (this J., 1904, 718).

THE furnace comprises a single arc and a single charging channel only, the fusion chamber being closed at its lower end by a refractory wall, in the bottom of which is pierced the tap hole for emptying the furnace. This renders practicable the installation of a battery of several similar furnaces.—B. N.

Furnace; Electric — P. Girod. Third Addition, dated May 29, 1905 to Fr. Pat. 329,822 of Feb. 28 1903 (this J., 1903, 1054; 1904, 1225; 1905, 740.)

THE modification described is suitable for a large battery of crucibles. The furnace contains a number of chambers for the crucibles, the walls of these chambers being surrounded by the resistance material which also fills the bottom of the chamber, below the crucibles. The heating current passes independently through these two sections of the resistance, and is conducted to the material by graphite blocks. The various portions of the furnace are provided with removable covers. The advantages of the present construction are stated to lie in the reduction of radiation losses and the possibility, by a suitable grouping of the sections of the resistance, of using almost any voltage of current which is available. The furnace shown in the patent is designed to heat 126 crucibles.—R. S. H.

Furnaces; Impts. in Electric Induction — O. Frick. Fr. Pat. 355,456, June 22, 1905. Under Int. Conv., Nov. 21, 1904.

THE annular crucible of an induction furnace is provided with a cover having only a single opening through which the materials are charged and the contents inspected. In order that this can be properly effected, either the cover or the main furnace can be rotated around a vertical axis. Two forms of furnace are described in one of which the charging is effected by hand, in the other automatically.—R. S. H.

ENGLISH PATENTS.

Soap; Process and Apparatus for the Preparation of — J. E. and C. S. Bedford, both of Leeds, and B. Crowther, of Gomersal, Yorks. Eng. Pat. 21,596, Oct. 8, 1904.

CLAIM is made for a process of manufacturing soap or soap.

powder by reducing its constituents to a fine state of division whilst under the influence of heat and a vacuum, the result being to effect saponification and then to concentrate and deodorise the product. The apparatus claimed for the process consists of a steam-jacketed horizontal cylinder provided with a horizontal shaft carrying revolving heating arms, and connected with a vacuum pump and means for condensing the evaporated vapour.—C. A. M.

Disinfectant and Detergent Compounds. J. F. Hawliczek. Eng. Pat. 23,463, Oct. 31, 1904. XVIII.C., page 1185.

Mineral Oils in general and Petroleum in particular: Process for Transforming — into Soap. M. Kuess. Eng. Pat. 23,727, Nov. 2, 1904. III., page 1166.

UNITED STATES PATENTS.

Press for Extracting Oil from Seeds and the like. V. D. Anderson, Cleveland, Ohio. U.S. Pat. 801,704, Oct. 10, 1905.

BELOW a continuously acting press is placed a strainer provided with a closely-fitting internal screw. Means are supplied for returning the solid matter withdrawn from the strainer by the screw to the press for further treatment. The oil expressed is collected in a settling tank where the "foots" are separated and returned to the press. The settling tank is provided with a heating device. (See also Fr. Pat. 328,945, 1903; this J., 1903, 1006.)

Candles; Manufacture of Composite Paraffin —. G. W. Gray, Assignor to the Standard Oil Co. U.S. Pat. 802,100, Oct. 17, 1905. III., page 1166.

FRENCH PATENT.

Hydrolysing Substances Contained in the Seeds of Plants; Separation of —. Ver. Chem. Werke, Fr. Pat. 350,122, Aug. 18, 1904.

THE crushed seeds are treated with a liquid immiscible with water, and possessing a higher specific gravity (1.2 to 1.4), e.g., a mixture of chloroform and petroleum spirit. The seed-husks and aleurone are deposited in two layers, whilst the uppermost layer, which contains the enzymic agent in suspension, is decanted, and the solvent evaporated. The substance thus obtained is very active, 0.1 grm. being sufficient for the hydrolysis of 100 grms. of oil. It is used as described in Fr. Pat. 328,101, of Oct. 9, 1902 (this J., 1904, 69).—C. A. M.

UNITED STATES PATENT.

Pigments; Manufacture of Printing Ink —. P. Fireman, Alexandria, Va., Assignor to E. G. Portner, Washington. U.S. Pat. 802,928, Oct. 24, 1905.

THE pigment, composed of magnetic black ferro-ferric oxide, is made by dissolving a ferrous salt, precipitating it completely in the cold by means of an alkali, and oxidising the precipitate by a current of air, until the proportion of ferrous to ferric iron is within the limits 1.0:0.8 to 1:2; the amount of oxidation is determined by analysis of samples taken from time to time. The product is then filtered, washed and dried in air or *in vacuo*. Owing to the oxidation unavoidable in the drying process, the product contains ferrous to ferric iron within the limits of about 1:2 to 1:3, and when "rubbed on white paper will leave a black impression without brown streaks, and when mixed with a suitable varnish will print a decided black.—W. C. H.

(B.)—RESINS, VARNISHES.

ENGLISH PATENT.

Linoleum, Oilcloth, and the like Materials; Machinery for Printing the Pattern on —. H. C. Shaw, St. Helens. Eng. Pat. 27,037, Dec. 12, 1904.

SINCE it is found impracticable to deposit on linoleum a sufficient body of paint, in accurate register, by rotating cylinders, the present invention provides a method of printing, by machinery, from the ordinary flat blocks used for hand printing. It consists (in combination with the means of impression and means for moving and guiding the linoleum) in carrying the printing blocks in a series of traversable block "carriers, each of which is provided with an inking device and is adapted for bringing the block which it carries into engagement with the impression device, and for guiding it whilst the impression is being made, so as to ensure alignment and preserve the register."—M. J. S.

(C.)—INDIA-RUBBER, Etc.

Rubber; Solubility in Benzine [Petroleum Spirit] of Different Kinds of —. S. Axelrod, Gummi-Zeit., 1905, 19, 1053-1056; 20, 105.

THE benzine employed had a sp. gr. of 0.6898 and distilled between 60° and 120° C. A solution containing a known amount of rubber dissolved in benzine was prepared, and the consistency determined by means of a viscosimeter constructed of a separating-funnel and a graduated cylinder. The time required for 100 c.c. of the solution to run from the funnel to the cylinder was noted, and this, divided by the corresponding figure for benzine alone, gave the "degree of viscosity" of the solution.

The following fifteen different rubbers were examined:—

Kind of Rubber.	Resin-content.	Loss on washing.
	Per cent.	Per cent.
1. Pará fine hard cure	3.4	15.0
2. Bolivian Pará	3.1	18.0
3. Peruvian balls	3.6	19.0
4. Sierra Leone	5.1	32.0
5. Upper Congo strips	5.2	11.0
6. Peruvian balls la la	5.86	24.0
7. Manoh twists	6.5	17.0
8. Congo balls	6.8	11.0
9. Ceylon Pará sheets	8.6	8.0
10. Borneo I	10.8	18.0
11. Manoh twists	10.6	42.5
12. Cameroon balls	12.6	46.0
13. Upper Congo	22.2	8.0
14. Blue cakes	26.9	20.5
15. Cameroon clusters dry	27.5	38.0

When tabulated in order of decreasing viscosity the arrangement becomes:—No. 1, No. 3, No. 4, No. 5, No. 10, No. 8, No. 9, No. 6, No. 12, No. 11, No. 7, No. 2, No. 11, No. 13, No. 15.

The resins accompanying the rubber, and more particularly the solid portions of them, are practically insoluble in benzene, and so doubtless increase the viscosity of the solutions. In order to determine to what extent this is the case, samples of the de-resinified rubber (de-resinified either with acetone or absolute alcohol) were treated in the same way as the original samples, and arranged in the following order of decreasing viscosity:—No. 1, No. 3, No. 5, No. 9, No. 10, No. 6, No. 8, No. 4, No. 2, No. 12, No. 7, No. 11, No. 13, No. 14, No. 15.

With two exceptions the de-resinified rubber solutions possess lower consistencies than those of the original rubbers. The difference is more especially marked in the case of rubbers containing solid and crystalline resins, as, for example, Nos. 4, 13 and 15, which are improved in viscosity by extraction. These contain resins which are fluid in character, and which, in accordance with Dietrich's view, may be regarded as acting as solvents for the rubber.

Solutions of the same kinds of rubber in benzol of high boiling-point were prepared and examined, with a view to determining whether the constituents insoluble in benzene and the resins exert any influence upon the viscosity of the solutions. All the solutions were practically clear and transparent. The arrangement in order of decreasing viscosity proved to be identical with that of Table II. for the rubbers examined, viz., as follows:—No. 3, No. 4, No. 5, No. 9, No. 6, No. 7, No. 2. This agreement appears to give a negative answer to the question, and supports the idea that the arrangement is independent of the properties of the solvent.

The degree of viscosity (η) and the percentage composition of the solution (p) are connected by the equation $\eta = c \cdot p^r$ where c is a constant depending on the kind of rubber, and r the tangent of the angle which the (straight line) curve drawn to the logarithms of the figures of the viscosity tables, makes with the horizontal.

It is noteworthy that the benzol solutions show a higher consistency than those in benzene, thus confirming Ditmar's observations; and also that the arrangement of the various kinds of rubber in Tables II. and IV. corresponds with the "quality" of the rubber.—E. W. L.

Silk; Artificial "Rubbered" —. P. Germain. Fr. Pat. 355,016, June 7, 1905. V., page 1169.

Rubber and other Analogous Gums; Process of Vulcanising and Regenerating — [with Nitrocellulose]. P. Germain. Fr. Pat. 355,017, June 7, 1905.

A SOLUTION of rubber is mixed in suitable proportion with a solution of nitrocellulose in acetone, a plastic and homogeneous paste being thus obtained. After evapora-

tion of the solvent, the caoutchouc is stated to be oxidised by the nitrocellulose, and a product is obtained having the properties of ordinary vulcanised rubber, but of a white colour and inodorous. Waste rubber, which has been vulcanised by this process, can be regenerated by merely treating it with a mixture of acetone and a rubber-solvent.—A. S.

XIV.—TANNING, LEATHER, GLUE, SIZE.

(Continued from page 1118.)

Gelatin; Air-Bubbles in —. C. Beadle. Paper and Pulp, 1905, 10, 631.

THE presence of minute air bubbles in cakes of commercial gelatin often imparts to them an unpleasant cloudy appearance. Duncker (Papier-Zeit.) states that these minute bubbles are the result of the rapid, continuous process of drying the sheets of gelatin by a counter-current of hot air. Owing to the rapid drying a hard dry skin is formed on the outside of the cake, leaving a central layer from which the moisture escapes only with difficulty, and in which the air bubbles remain behind. Since the best qualities of gelatin dry most rapidly, the presence of these minute bubbles is, to a certain extent, an indication of superiority, and they very rarely occur in the poorer qualities of gelatin. Gelatin dried slowly in the old way is liable to be damaged by fermentation during drying; in such cases large bubbles of gas are formed in the sheets, and are a sign of bad quality.—J. F. B.

ENGLISH PATENTS.

Tanning; Impts. in — and in the Treatment of Waste Tanning Materials and Liquors. E. E. M. Payne, Aylesbury, Bucks. Eng. Pat. 26,778, Dec. 8, 1904.

THE patentee claims the recovery and utilisation of the insoluble leather-forming constituents contained in waste tanning materials and liquors. These waste materials and liquors are treated with an alkaline solution, as caustic soda, which dissolves the insoluble active tanning matters; the liquor then, if necessary, may be made neutral. Neutral or slightly acid skins are immersed in the liquor and afterwards treated with an acid, with or without subsequent tanning.—W. B. H.

Glue and Gelatin; Process of and Apparatus for Manufacturing —. H. Hilbert, Heufeld, Germany. Eng. Pat. 27,425, Dec. 15, 1904.

SEE Fr. Pat. 349,045 of 1904; this J., 1905, 628.—T. F. B.

UNITED STATES PATENT.

Animal Sinews; Process for Treating —. W. Polatsik. Assignor to S. Florsheim, both of Chicago, Ill. U.S. Pat. 801,547, Oct. 10th, 1905.

THE process consists in immersing animal sinews successively in petroleum or benzene to remove the "outer fleshy animal skin"; in a hardening and preserving bath, as boric acid, or alum and copper sulphate; and in an alkaline bath to remove fatty matter from the fibrous part of the sinew. The sinews are afterwards tanned and disintegrated.—W. B. H.

FRENCH PATENT.

Hides and Skins; Process of Tanning —. C. Baron and J. Aubert. First Addition, dated May 27th, 1905, to Fr. Pat. 347,097, Oct. 14, 1904 (this J., 1905, 284).

IN this addition practical details of carrying out the process described in the main patent are given; thus the rosin soap is composed of 60 kilos. of rosin; 20 kilos. of 95 per cent. caustic soda; and 20 litres of water. 5 to 15 per cent. of this soap, calculated on the weight of the prepared pelt is used. The hides remain in this first bath 24 to 72 hours. The weight of aluminium sulphate in the second bath should be 20 per cent. more than that of the soap used. After tanning, the hides are submitted to the action of albuminoids and fats to fill the fibres and

prevent the "grain" from cracking; they are then dried in the air and afterwards at a temperature not exceeding 35° C.—W. B. H.

XV.—MANURES, Etc.

(Continued from page 1119.)

FRENCH PATENTS.

"Phospho-Guano"; *Manufacture of* — in part from Bones. E. Guérif. Fr. Pat. 355,374, Feb. 11, 1905.

BONES, after being soaked in water, are heated in an earthenware vessel with sulphuric acid, in stated proportion. The product is dried in the same vessel, with addition of a mineral phosphate, and after cooling and addition, in some cases, of ammonium sulphate and potassium chloride, the manure is sacked for delivery. —E. ENGLISH PATENT.

Potatoes; Preservation [Freezing] of —. F. Lankow, Kiel, Germany. Eng. Pat. 1048, Jan. 19, 1905.

THE treatment consists in successively freezing, thawing, pressing and drying the potatoes with the object of using them as raw material in the manufacture of beer, spirits, yeast, potato-meal and starch. For the latter purposes the potatoes are perforated and then subjected to a rapid but thorough freezing process. The temperature should not be below -3° C. For the production of fine-meal the potatoes are frozen slowly and for a long time without previous perforation. After pressing to remove the potato juices the potatoes are finely divided, dried and ground up. The peel is removed if the potatoes are to be used for making fine-meal, otherwise it is left on.—W.P.S.

UNITED STATES PATENT.

Lactalbumin and Milk Sugar; Process of Producing —. A. S. Ramage, Assignor to Ramage Technical Co. U.S. Pat. 801,691, Oct. 10, 1905. XVIII., page 1184.

FRENCH PATENTS.

Sugar; Process of Purifying and Preserving Raw —. M. Weinrich. First Addition, dated June 9, 1905, to Fr. Pat. 325,882, Sept. 26, 1902 (see this J. 1902, 1547 and 1903, 754).

THE process described in the original patent can be extended to the treatment of massecuites, centrifugal syrups and molasses for the purpose of raising their degree of purity. The dissolved impurities are destroyed by treating the materials with a small proportion of quicklime in the form of a fine powder, mixing thoroughly and raising the temperature to such a point, e.g., 43°—45° C., that the lime reacts with the impurities and colouring matters without decomposing the glucose or producing caramel and lime salts. The liquid is then diluted and neutralised with carbon dioxide.—J. F. B.

Seaweed; Treatment of — for the Extraction of Mineral and Organic Chemical Matters. Mme Laureau, née J. H. Laureau. Addition, dated May 24, 1905, to Fr. Pat. 352,069, March 6, 1905. VII., page 1172.

XVII.—BREWING, WINES, SPIRITS, Etc.

(Continued from page 1121.)

Barley; Relations of the Proteids to the Malting Qualities of —. M. Wallerstein. (Paper read before the Amer. Brewing Inst.) The Brewers' J., 1905, 41, 523—524, 568—569, and 618—620.

THE above question is discussed from the point of view of American barleys and American malting practice. With the exception of Montana and California Bay barleys, the American barleys are distinctly richer in protein than the average European barleys. Certain German authorities have put forward the hypothesis that the percentage of extract yielded by the malt is inversely proportional to the percentage of protein in the barley. The author shows that in the case of American barleys, although a certain tendency in this direction is observed, the dependence of the yield of extract on the protein is by no means regular. The percentage of husk plays a very prominent part as an additional factor in determining the yield of extract. A further difference between the majority of American barleys and European barleys is the smaller size of the corns. In Germany, corns which pass through a 2.2 mm. hole are regarded as "outshots," and are not malted, but most American barleys contain 25—50 per cent. of such corns. It is shown in a table that barleys with the largest and heaviest corns generally give malts with the highest yields of extract, and this factor may frequently outweigh the influence of the protein factor. American malting conditions are frequently regarded in Europe as "forced," but the author shows that the shorter time on the floor required to give good modification of the endosperm is due to the smaller size of the corns, and that the large-corned Montana barley, poor in protein, requires the same length of treatment as European barleys. In the author's opinion the most suitable type of barley for American conditions is a 6-rowed, rather small, but full-corned barley, containing between 10.5 and 12 per cent. of proteids. Owing to the fact that in America 30—40 per cent. of raw cereal is mashed with the malt, the low protein standard, which is regarded as desirable on the Continent, would be unsuitable, and 10.5 per cent. is really the lowest limit. American beers are more stable and less sensitive to chill than German beers, owing to their low percentage of proteids, this low protein content being due to the use of raw grain and to the fact that the beers are generally stored at a very low temperature for several weeks before filtration, whereby the unstable albuminoids are eliminated.—J. F. B.

Barleys; Relation of Protein Content and Degree of Modification of Austrian — to the Yield of Extract and Degree of Mellowness of the Malt. E. Prior. Allgem. Z. Bierbrau. und Malzfab., 1905 [37]; Z. ges. Brauw., 1905, 28, 722—723.

THE author has studied in the case of 48 samples of barley of Austrian origin the relations existing between the protein content and degree of modification of the barley and the yield of extract from coarse and fine grist of the malt, also its degree of mellowness and the colour of the worts. He concludes that appreciable differences exist between the proportion of protein in the barley and that in the malt, and that the yield of extract is not directly related to the protein content of the barley. In addition to the general conclusions formulated in his previous paper (this J., 1905, 1078), the author states that in the case of Austrian barleys, those with a protein content of 10—11 per cent. showed on an average equal values for the degree of modification of the barley, yield of malt extract, and degree of mellowness of the malt as those barleys with a protein content of 9—10 per cent. Consequently, Haase's theory, that barleys containing over 10 per cent. of protein are inferior in quality, is not applicable to Austrian barleys. Moreover, even the barleys with protein contents of 11—12 per cent. gave, for the most part, malts with extracts exceeding 77 per cent. The author regards the degree of modification of the barley endosperm (see this J., *loc. cit.*) as one of the mc

important factors in determining the brewing value of a barley; it outweighs the protein factor. The majority of Austrian barleys give better yields of malt extract than would be expected according to Haase's protein law, which was formulated for Silesian barleys. With any given percentage of nitrogen, it depends principally on the degree of modification of the barley and on the mellowness of the malt whether Haase's law is followed or not, and this law only holds for those Austrian barleys which are relatively steely.—J. F. B.

Amylase; Development of — during the Germination of Barley. J. Effront. *Comptes rend.* 1905, 141, 626—628.

DURING the germination of barley the saccharifying and liquefying powers develop unequally. The former increases irregularly up to about the twenty-third day, when it attains its maximum, and then gradually decreases. On the other hand, the liquefying power rises steadily until a maximum is reached on the twenty-seventh day, and then remains constant for a considerable time. The process of development of the two functions of the amylase in barley is expressed in the following table:—

Duration of Germination in Days.	Saccharifying Power.	Liquefying Power.
6	1.06	6.6
10	1.68	11.4
12	1.40	13.1
14	1.38	16.4
16	1.80	18.0
20	2.20	22.8
23	2.50	32.0
25	2.30	36.0
27	2.10	40.0
30	2.18	40.0

The saccharifying and liquefying powers were determined in all the tests on the same number of grains. Their value is expressed respectively by the amount of maltose formed and of starch liquefied by the diastase of 1 gm. of barley. The method serving for these analyses are described in the author's treatise on "Les Enzymes." The difference in the development of the two properties of amylase is very marked when the grain is allowed to germinate in sunlight: the liquefying power rises to its maximum whilst the saccharifying power is reduced by about 50 per cent. In the course of the investigation, the endeavour was made to establish the conditions under which malt of maximum activity is obtained. When the germination is allowed to take place at 15° C., the maximum of diastase is developed after 10 or 11 days. The influence of certain chemicals on the germination of barley is described, the chemicals being added in the steeping cistern. Germination is favoured by phosphates, lime-water, copper sulphate (0.5 gm. per litre), and xylene (1 c.c. per litre), the latter also increasing the saccharifying power. Ammonium chloride increases the liquefying power, whilst lactic acid (2 grms. per litre), vegetablepeptone and calcium hypochlorite promote germination and increase the diastatic properties of the malt. The plumule is developed to the detriment of the radicle by steeping the grain in 0.1 per cent. copper sulphate solution or in N/10 sodium hydroxide solution; in some cases malt is obtained completely devoid of radicle when thus treated. The action of calcium hypochlorite is interesting; in the presence of alkali it favours germination, but is detrimental to the formation of diastase, whilst in the ordinary condition it increases the diastatic power by about 50 per cent. The best results are obtained when the solution contains from 0.5 to 0.7 gm. of active chlorine per litre.—W. P. S.

Acetic Acid; Production of — during Alcoholic Fermentation. R. Reisch. *Centralbl. Bakt.*, 1905 [Abth. 2], 14, 572—581; *Wochensch. Brau.*, 1905, 22, 611—612.

THE production of acetic acid by yeast takes place simultaneously with that of alcohol. The quantity of acetic acid produced is a characteristic of the race of yeast and appears to be to some extent proportional to its fermentative power. As soon as fermentation really

begins, a sudden and considerable increase of the percentage of acetic acid is observed. The formation of acetic acid soon becomes weaker, and, when about one-half of the sugar has been fermented, it ceases altogether. The addition of alcohol to the wort, before fermentation, has no influence on the quantity of acetic acid produced, but the previous addition of acetic acid has a powerful inhibitive influence on this function of the yeast. Larger quantities of acetic acid are produced in fermentations by yeast cell-juice than in fermentations by yeast cells; this is attributed to the removal of the regulating influence of the living protoplasm on the enzyme which produces the acetic acid. The author regards this enzyme as belonging to the class of "protective" enzymes, i.e., those which produce substances inimical to competitive organisms, but relatively harmless to the yeast itself.—J. F. B.

Fermenting Liquids; Apparatus for Aerating —, and for Preparing Vegetable and other Infusions. A. J. Murphy, Leeds. Eng. Pat. 26,136, Dec. 1, 1904.

THE apparatus consists of a number of perforated tubes or cylinders arranged in a vertical position between perforated base and top plates, and around a central rod. The tubes are filled with shavings, wood chips, leaves, granulated metal or the like, and the apparatus is suspended over the tank containing the fermenting liquid, by means of a turning-jack adapted to keep it in continual motion. The apparatus is lowered into the liquid, then raised, rotated for a time, lowered again, and so on. An apparatus of larger size may be built up by fitting a number of the above tubes in a cage one above another. For making infusions, &c., the materials are placed in the perforated tubes and then lowered and rotated in the solvent.—W. P. S.

Fermentation [Distillery]; Process of —. J. T. Board, Willsbridge, and T. H. Board, Bristol. Eng. Pat. 26,698, Dec. 7, 1904.

FERMENTATION is conducted in three stages:—A very small quantity of thick mash is first prepared with malt, rye and molasses; this is then soured to a suitable degree and fermented with yeast. When the fermentation is complete, the yeast is separated from the thick mash by washing through a sieve. The yeast is then suspended in a column of water in which the mature cells settle to the bottom, whilst the immature yeast and other ferments remaining in the water are thrown away. The mature yeast is employed for pitching a quantity of clear wort (e.g., about 6 per cent. of the total wort), and when this is partially fermented it is pitched in the main wash.

Beer; Process for the Manufacture of a Product which Enables — to be Hopped in a Rational and Economical Manner. G. Barker, Birmingham. From G. Ronnberg and Co., Brussels. Eng. Pat. 11,147, May 29, 1905.

SEE Fr. Pat. 351,160 of 1905; this J., 1905, 1121.—T. F. B.

FRENCH PATENT.

Alcohol, &c.; Plates for Apparatus for Concentrating and Rectifying —. F. Calmunt. Fr. Pat. 351,674, May 26, 1905. Under Int. Conv., March 28, 1905.

THE special form of plate for rectifying columns is shown in cross-section in Fig. 1 and in plan in Fig. 2. The plate, 1, fixed to the walls of the column, is pierced by a number of holes, 3, from each of which rises a tube, 4, bent in the form of an inverted U and terminating in a rectangular box, 5, with perforated sides, the bottom of which is situated at a distance of 2 cm. above the plate. The alcoholic vapours rising through the tubes in the

Fig. 1.

Fig. 2.

plate are distributed in passing through the perforations in the boxes, and are again subdivided in their passage through the liquid by means of a perforated baffle-plate, 6, extending right across the column at a distance of 1.5 cm. above the boxes. The level of the liquid on the plate is maintained at a height of 3 cm. above the baffle-plate by the overflow pipe 7. The pipe 8, and the external cock 9, enable the liquid to be drawn off the plate through the pipe 13, whenever it is desirable to do so.—J. F. B.

Milk, Cream and other Liquids; Process of Sterilising —, by means of Hydrogen Peroxide or other Germicide. A. Silfverling and F. Z. Franzén. Fr. Pat. 355,457, June 22, 1905. Under Int. Conv., June 23, 1904.

THE preservative is added to the milk or other liquid as it enters a centrifugal machine, the object being to thoroughly and rapidly mix the two by the subsequent centrifugal action.—W. P. S.

Butter; Process of Making and Preserving —. E. Engel. Fr. Pat. 355,362, June 19, 1905.

CREAM is heated on a water-bath for a sufficiently long time to destroy the organisms which cause the butter to turn rancid, &c. After cooling, the cream is inoculated with cultures of lactic acid bacteria and churned. The butter obtained is washed and worked with sterilised water and then stored in hermetically closed tins, preferably in an atmosphere of carbon dioxide.—W. P. S.

Grain; Process of Treating —. C. Broeker. Fr. Pat. 355,378, April 18, 1905.

SEE Eng. Pat. 6939 of 1905; this J., 1905, 1027.—T. F. B.

GERMAN PATENT.

Sterilisation and Preservation of Liquids [as Milk] which are Easily Decomposable or are Contaminated with Bacteria; Process for the —. Farb. vorm. Meister, Lucius und Brüning. Ger. Pat. 161,184, Jan. 14, 1904.

THE process consists in keeping formaldehyde vapour in contact with the surface of the liquid, whilst fresh portions of the liquid are continually brought to the surface by agitation or similar means. It is stated that by this process sterilised milk can be prepared having the same taste and odour as the purest fresh milk, and behaving exactly the same as the latter in respect to coagulation by heating and by means of rennet. It is claimed also that formaldehyde cannot be detected in the milk after the treatment.—A. S.

(B.)—SANITATION; WATER PURIFICATION.

Water; Purification of —. [Softening by means of Aluminates]. D. Peniakoff. Bull. Soc. Chim. Belg., 1905, 19, 122—136 and 159—171.

THE writer shows by actual experiment that calcium sulphate and carbonate are completely removed from water by treating the latter with barium aluminate, and that the hardness of the water is reduced to zero. If calcium chloride be present, the addition of sodium sulphate is necessary, the equation for the removal of the whole of the calcium salts being:—

Magnesium carbonate and sulphate are also completely precipitated by barium aluminate, but the chloride is not, barium chloride being formed and remaining soluble in the water. The addition of sodium sulphate decomposes this, however, giving sodium chloride and barium sulphate. In this case it is better to add an equivalent quantity of sodium aluminate. To soften a water, therefore, the amount of calcium, magnesium, sulphuric acid, chlorine and carbon dioxide (both free and combined) must be determined, and the equivalent amounts of barium aluminate, sodium aluminate, and sodium sulphate added after previously neutralising the free carbon dioxide with lime-water.—W. P. S.

Ice; Study of Artificial —. G. Calvi. Giorn. Farm. Chim., 1905, 54, 385—389. Chem. Centr., 1905, 2, 1293—1294.

ARTIFICIAL ice nearly always consists of two portions, an outer transparent, crystalline part, and an inner, opaque, snowy portion, in which most of the impurities

are concentrated. The results of the analysis of a sample of artificial ice are shown in the following table:—

	Water obtained by melting the ice, including the insoluble matter	Water decanted from insoluble residue.	Water obtained by melting outer crystalline portion of the ice.
	Mgms. per litre.	Mgms. per litre.	Mgms. per litre.
Dry residue at 100° C.	275.0	167.0	small traces

UNITED STATES PATENT.

Water; Apparatus for Purifying — [Prevention of Boiler-Scale]. R. T. Weaver, Cleveland, Ohio. Assignor to J. Schneible, Weehawken, N.Y. U.S. Pat. 801,943, Oct. 17, 1905.

For preventing the formation of scale in boilers, the water is passed on its way between the feed-water heater and the boiler through a vessel containing a filtering material and tale, granite or other silicious mineral. The vessel contains a number of chambers placed one above the other. The first chamber containing the filtering material is separated from the others by a screen, whilst between the other chambers are placed cutting plates against which the tale, &c., is forced by the current of water, and is thus partially disintegrated.—W. P. S.

FRENCH PATENT.

Air; Process and Apparatus for Regenerating Breathed-out —, to Render it Fit for Respiration. M. Bamberger, F. Böck and F. Wanz. First Addition, dated June 9, 1905, to Fr. Pat. 345,490, June 21, 1904.

UNITED STATES PATENTS.

Wood-Pulp; Apparatus for Treating [Drying] —. W. A. Hall, Bellows Falls, Vt. U.S. Pat. 802,754, Oct. 24, 1905.

For drying wood-pulp, a series of heated drying rolls

are provided with an endless apron or carrier passing round them; the pulp is delivered on to this apron and is broken up and somewhat disintegrated, after it leaves each of the drying cylinders, by means of stationary knives or "doctor blades" which enable the steam to escape more readily than otherwise. The pulp is thus presented to each of the drying rolls in turn as a loose and broken up mass, and is finally delivered to an apparatus in which it is compressed into bales for shipment.—J. F. B.

Wood-Pulp; Process of Treating [Drying] —. W. A. Hall, Bellows Falls, Vt. U.S. Pat. 802,755, Oct. 24, 1905.

The process consists in delivering a sheet of wet pulp to one end of a series of drying cylinders, breaking it up and drying it in a loosely compacted form, and packing the dry pulp into bales in a continuous operation, as described in U.S. Pat. 802,754 (preceding abstract).—J. F. B.

FRENCH PATENTS.

Textile Material or Paper Pulp; Application of a Plant [Gyspel] for Obtaining —. P. Boy. Fr. Pat. 350,117, Aug. 16, 1904. V., page 1169.

Paper Pulp from Sage; Manufacture of —. E. Imhaus. Fr. Pat. 355,245, June 15, 1905.

SAGE plants are steamed, washed and pressed, and the essential oil and colouring matters are extracted by suitable solvents; the residual wood is cut into pieces and treated with caustic alkali or bisulphite under pressure for the isolation of the cellulose. Alternatively, the wood may simply be boiled with water under pressure.—J. F. B.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

(Continued from page 1125.)

Pilocarpine; Constitution of —. J. Conversion of Isopilocarpine into Pilocarpine. H. A. D. Jowett. Chem. Soc. Trans., 1905, 87, 794–798.

In a previous communication (Chem. Soc. Trans., 1903, 83, 438) the relation of pilocarpine to the isomeric isopilocarpine, the constitution of which has been established, was discussed, and it was shown that the evidence, on the whole, favoured the view that the two alkaloids were stereoisomerides. After further discussion of the question, the author points out that if this view is correct, then the conversion of pilocarpine into isopilocarpine should not be complete, but a state of equilibrium should result. Further, by acting on isopilocarpine under the conditions which convert pilocarpine into isopilocarpine, for example, heating with alkali, the same state of equilibrium should be produced, and it should then be possible to isolate some pilocarpine from the mixture. If, on the other hand, the alkaloids are structural isomerides, this reverse change should not be possible. On trying the experiment, it was found that pure isopilocarpine nitrate, like pilocarpine nitrate, is converted by the action of alcoholic potash into an equilibrium mixture consisting chiefly of isopilocarpine, with a small percentage of pilocarpine, and this result affords further evidence that the two alkaloids are not structural isomerides but stereoisomerides. The relation between the two alkaloids may be expressed as follows, the isomerism being due to the racemisation of the asymmetric carbon atom attached to the carbonyl group:—

—A. S.

β-Coniceine. K. Löffler. Ber. 1905, 38, 3326—3329.

FINELY powdered conhydrine was mixed with phosphorus pentoxide and sealed up in a glass tube in an atmosphere of dry hydrogen. The tube was heated up to 180°—190° C. in the course of two hours and maintained at that temperature for 20 minutes. The product was dissolved in water and extracted by ether. On fractional distillation, nearly the whole product distilled between 167° and 169° C. The distillate solidified, yielding a base melting at 40°—41°, which was identified as *β-coniceine*, obtained by A. W. Hofmann, together with an equal quantity of *α-coniceine*, by the action of fuming hydrochloric acid on conhydrine. *β-Coniceine* has a density of 0.8519 at 50° C. and $[\alpha]_D = -52.99^\circ$ at 42° C. Thus the main product of the dehydration of conhydrine by phosphoric anhydride is the solid, secondary, unsaturated base *β-coniceine*, a small quantity of a liquid base of very similar constitution being also formed. The liquid, tertiary, saturated base *α-coniceine*, obtained when hydrochloric acid is employed, is not formed at all; hence it is concluded that in the dehydration produced by phosphoric anhydride the hydrogen of the imino group is not concerned. When the dehydration is effected for a longer time at a higher temperature, e.g. for one hour at 220° C., the product consists almost entirely of the liquid secondary base mentioned above.

—J. F. B.

Oxysparteine; Note on —. F. B. Ahrens.
Ber., 1905, 38, 3268.

OXYSPARTEINE can be obtained in quantitative yield by the oxidation of sparteine with potassium ferricyanide in alkaline solution. The alkaline solution of ferricyanide is added to sparteine at the ordinary temperature and with agitation, until the alkaloid has completely dissolved, and no change of colour is produced on adding more ferricyanide. The oxysparteine is extracted from the solution by shaking with ether or chloroform.—A. S.

Thalictrum Aquilegifolium; Presence of a Cymogenetic Glucoside in —. L. van Itallie. J. Pharm. Chim., 1905, 22, 337.

THE aqueous distillate of the fresh leaves of *Thalictrum aquilegifolium* contains from 0.05 to 0.06 per cent. of hydrocyanic acid, calculated on the weight of the leaves distilled, or about half as much as is yielded by the leaves of *Prunus laurocerasus*. Acetone is also present in the distillate, but no benzaldehyde. A minute quantity of hydrocyanic acid is also found in the distillate from the stems. The acid is not present in the free state since it is not found in fresh leaves after they have been plunged into boiling alcohol; it is generated, however, in an infusion of stove-dried leaves, by the action of emulsin. The presence of a glucoside resembling phaseolunatin is, therefore, inferred. The leaves also contain a ferment which hydrolyses amygdalin. The leaves of the nearly allied plants *Thalictrum flavum* T. minus and *T. glaucum*, do not yield hydrocyanic acid on distillation.—J. O. B.

Glucosides; Experimental Investigation of the Nature of the Sugars of some —. H. Ter Meulen. Rec. trav. chim. Pays-Bas, 1905, 24, 444—483. Chem. Centr. 1905, 2, 1251—1555.

ACCORDING to the author the hydrolysis of glucosides by dilute acids proceeds further than hydrolysis by means of enzymes. For example, xanthorhamnin $\text{C}_{33}\text{H}_{42}\text{O}_{20}$, is decomposed by dilute acids into rhamnetin $\text{C}_{16}\text{H}_{18}\text{O}_7$, galactose and rhamnose, whereas, on hydrolysis by means of an enzyme, it yields rhamnetin and

rhamminose, $\text{C}_{18}\text{H}_{32}\text{O}_{14}$. In determining the nature of the sugar contained in a glucoside, hydrolysis by means of an enzyme should therefore be employed. On the supposition that enzymic hydrolysis is a reversible process, and the equilibrium can be displaced by addition of one of the reaction products, the author made use of the following method, the results appearing to justify this supposition. A number of flasks, each containing the same quantities of the glucoside water and an enzyme, and to which equal quantities of different sugars were added, was kept at a definite temperature, for a certain short period of time, and the amount of glucoside decomposed, determined in each case. In the flask in which the sugar yielded by the glucoside was identical with the added sugar, the amount of decomposition was less than in the flask to which no sugar had been added.—A. S.

Barbaloin; Constitution of —. I. H. A. D. Jowett and C. E. Potter. Chem. Soc. Trans., 1905, 87, 878—884.

THE authors review the work which has been done on barbaloin, and state that the evidence adduced by Léger (this J., 1902, 1037; 1903, 161) in support of a change of the formula for this substance from $\text{C}_{16}\text{H}_{18}\text{O}_7$ (Tilden) or $\text{C}_{16}\text{H}_{16}\text{O}_7$ (Groenewald) to $\text{C}_{21}\text{H}_{20}\text{O}_9$ is by no means conclusive. The results of numerous analyses and of two determinations of the molecular weight of carefully purified barbaloin have confirmed the formula $\text{C}_{16}\text{H}_{18}\text{O}_7$, and this formula is also supported by the results of the analysis and determinations of the molecular weight of tribromobarbaloin. The specific rotation of barbaloin in 90 per cent. alcohol solution was found to be $[\alpha]_D = -8.3^\circ$, as compared with $[\alpha]_D = -10.4^\circ$ found by Léger in ethyl acetate solution. A small yield of aloë-emodin was obtained by the action of hydrogen chloride in alcoholic solution on barbaloin as described by Oesterle (Arch. Pharm., 1899, 237, 81), but it was not found possible to confirm Léger's statement (this J., 1902, 1094) that aloë-emodin is formed by the action of sodium peroxide on barbaloin. The authors carried out some experiments with tribromobarbaloin, $\text{C}_{16}\text{H}_{15}\text{O}_7\text{Br}_3$, m.p. 191°—192° C., from which they prepared a tetra-acetyl derivative in the form of small yellow needles melting at 135° C., soluble in alcohol, but insoluble in water. Tribromobarbaloin, therefore, contains four hydroxyl groups, and probably barbaloin does also; both substances yield methylanthracene on distillation with zinc dust. Sufficient data were not obtained from which to construct a constitutional formula, but it is pointed out that the generally accepted view that barbaloin contains an emodin (trihydroxymethylanthraquinone) complex is open to serious objection. (See also this J., 1897, 756; 1898, 866; 1900, 768; 1901, 66; and 1903, 43.)—A. S.

Patchouli Oil. A. W. K. de Jong. Rec. trav. chim. Pays-Bas, 1905, 24, 309—312. Chem. Centr., 1905, 2, 1180.

THE author has examined the essential oils from the following three varieties of patchouli, growing in the botanical gardens at Buitenzorg:—I. *Patchouli fleurissant* (*Pogostemon Heyneanus* Bth., ?), II. *P. de Singapour* (*Pog. tomentosus* Hassk. ?), and III. *P. de Java* (a variety of *Pog. tomentosus* Hassk. ?). After drying with sodium sulphate, the oils had the following characters:—Sp. gr. at 25° C.: I., 0.922; II., 0.949; III., 0.929; $[\alpha]_D^{25}$: I. = $-16^\circ 10'$, II. = $-51^\circ 24'$, III. = $-42^\circ 48'$. On adding 90 per cent. alcohol to the oils, a turbidity was produced at first, but disappeared on further addition of alcohol. The amounts of alcohol required to dissolve 10 c.c. of oil were:—I., 100 c.c.; II., 60 c.c.; III., 7.5 c.c. By distillation at 740 mm. pressure, the following fractions were obtained:—I., 130°—250° C., 17 per cent.; II., 230°—250° C., 2 per cent.; III., 145°—250° C., 10 per cent.; 250°—270° C., I., 50 per cent., II., 60 per cent., III., 70 per cent.; 270°—280° C., I., 16 per cent., II., 20 per cent., III., 8 per cent.; 280°—300° C., I., 10 per cent., II., 10 per cent., III., 6 per cent. Oils II. and III. frequently gave green- or blue-coloured distillates, owing to the presence of Gladstone's "azulene," which, however,

may have been formed under the influence of heat during the distillation. On treating patchouli oil with concentrated sulphuric acid, heat is evolved; the residual unattacked oil amounted to 17 per cent. with I., 22 per cent. with II., and 20 per cent. with III. From this residual oil, a sesquiterpene was obtained, boiling at 260° – 263° C. at 740 mm., and with $[\alpha]_D^{25}$; $n_D = 1.5^{\circ}$; $n_D = 1.5^{\circ}$;

sp. gr. at 25° C., II., 0.915, III., 0.897. The author names it *dilemene*, and regards it as possibly identical with the sesquiterpene obtained by von Soden and Rojahn (this J., 1904, 1111) from patchouli oil, and having the sp. gr. 0.930, $n_D = +0^{\circ} 45'$, and b. pt., 273° – 274° C.—A. S.

Formaldehyde: Studies on —. I. *Formaldehyde in Aqueous Solution.* F. Auerbach and H. Barschall. *Arbb. Kais. Ges. A.*, 22, 584–629. *Chem. Centr.*, 1905, 2, 1081–1083.

An aqueous solution of pure formaldehyde was prepared by subliming trioxymethylene in a current of nitrogen, and collecting the vapour in water, and the specific gravities of solutions of different strengths were determined at 18° C. The results of molecular weight determinations by the cryoscopic method showed that the molecular weight of formaldehyde in aqueous solutions depends upon the concentration of the latter. The application of the law of mass action to the values found, indicates that in aqueous solutions, mono- and tri-molecular forms of formaldehyde are present in a condition of equilibrium. The observed and calculated results are in still closer agreement if it be assumed that hydration of both the monomolecular (to methyleneglycol) and trimolecular forms takes place. In solutions containing 37–38 per cent. (by vol.) of formaldehyde, there are indications of the presence of higher polymers than $(CH_2O)_3$. The equilibrium between the different molecular forms of formaldehyde is reversible, so that the condition of aqueous solutions of formaldehyde, a short time after preparation, depends only upon the concentration and temperature, independently of whether they have been prepared from gaseous formaldehyde, CH_2O , or solid paraldehyde, $(CH_2O)_3$. Rise of temperature causes a displacement of the equilibrium in favour of the monomolecular form, the polymeric modifications being decomposed with absorption of heat.

The boiling point of the aqueous solutions decreases with increasing concentration, but is almost constant for solutions containing about 30 per cent. or more (by vol.) of formaldehyde. In the distillation of aqueous solutions of formaldehyde, however, the distillate is always poorer and the residue always richer in formaldehyde than the original solution, a fact leading to the remarkable conclusion that a higher boiling portion distills over, whilst a lower boiling portion remains behind. The residual portion has a higher vapour pressure than the fraction collecting in the receiver. The partial pressure of formaldehyde in its solutions was determined at 100° C. and 18° C. The low value found, indicates that gaseous formaldehyde when dissolved in water is, for the most part, converted into hydrated and polymerised modifications. From the values obtained in the partial pressure determinations, the authors calculated the amounts of formaldehyde contained in a given air space saturated at 18° C. with the vapours of formaldehyde solutions. The amount was only 0.66 gm. for the strongest solution examined (33.8 per cent.) and would not attain 1 gm. even with the commercial 40 per cent. methyl alcoholic solution.—A. S.

Benzoyl Peroxide. A. S. Löwenhart. *Therap. Monatsh.*, 1905; through *Apoth. Zeit.*, 1905, 20, 655.

ONE hundred grms. of sodium peroxide are treated with 180 grms. of benzoyl chloride at about 4° C. The compound formed is separated by filtration and crystallised from hot alcohol. The yield is between 60 and 70 per cent. of benzoyl peroxide. It is a stable, colourless body, crystallising in fine prisms; m. pt. 103.5° C. It has been introduced as a medical disinfectant on account of its anæsthetic antiseptic action.—J. O. B.

Di-potassium Salicylate: Action of Potassium Hypo-halogenite on —. Lassar-Cohn and F. Schultze. *Ber.*, 1905, 38, 3294–3302.

AN ice-cooled solution of potassium hypochlorite, hypobromite or hypoiodite is added to an ice-cooled solution of dipotassium salicylate. Action takes place at once, a hydrogen being displaced by the halogen, e.g., $C_6H_4.OK.COOK + KOCl = C_6H_4.ClOK.CO.K + KOH$. The potassium salt obtained is acidified with sulphuric acid, when the free acid is precipitated.

From 1 gm.-mol. of potassium hypochlorite and 1 gm.-mol. of dipotassium salicylate two acids are produced, monochlor-salicylic acid $C_6H_3.COOH.OH.Cl$ (1.2.6) and dichlor-salicylic acid $C_6H_2.COOH.OH.Cl_2$ (1.2.5.6). If the hypochlorite be added in the proportion of 4 gm.-mols. to 1 gm.-mol. of the salicylate, trichlorophenol is among the products.

Exactly similar results are obtained with potassium hypobromite. With potassium hypoiodite, only one acid, monoiodo-salicylic acid $C_6H_3.COOH.OH.I$ (1.2.4), is obtained.—C. F. F.

Sulphonal Carboxylic Acids in comparison with the corresponding Keto Acids: Stability of —, and the Physiological Activity of Acid or Basic Sulphonal Derivatives. T. Posner. *Chem.-Zeit.*, 1905, 29, 1107–1108.

THE author reviews his work on sulphonal-carboxylic acids. On hydrolysing the disulphone of pyrotartaric ethyl ester, $CH_3.C(SO_2C_2H_5)_2.COOC_2H_5$, carbon dioxide and alcohol separate and ethylidene disulphone, $CH_3.CH(SO_2C_2H_5)_2$, is produced. The disulphone of aceto-acetic ester on hydrolysis decomposes into ethyl-sulphinic acid and the unsaturated alkyl-sulphone-isocrotonic acid:—

If the α hydrogen atoms of aceto-acetic acid are replaced by alkyl groups it is possible to isolate a β -disulphone-carboxylic acid. The disulphone of acetone-dicarboxylic acid ester behaves in a similar way on hydrolysis:—

With a γ -keto acid such as levulinic acid, the mercaptol of the acid can be oxidised, or the disulphone of the ester hydrolysed without further decomposition. The mercaptol condensation compounds with α - or β -keto acids decompose in the same way as the corresponding disulphones:—

According to experiments of Hans Meyer (*Arch. exp. Pathol.*, 1899, 42, 118.) on alcohol narcosis, only chemically indifferent substances, which are solvents for fats and similar bodies, can act as narcotics. Diethylsulphone-valeric acid was, therefore, physiologically tested. The sodium salt was non-poisonous and non-narcotic. The phenetidine and piperidine were only very slightly narcotic. The diethylamide was narcotic, but Meyer has shown that many amides in which the acid grouping is inactive have the same action. The diethylamide is said to have a smaller hypnotic action than sulphonal, but a greater depressing action on the respiratory system. The hydrochloride of aminosulphonal, although easily soluble, is without marked action, the introduction of the salt-forming group having removed the characteristic action of the chemically indifferent sulphonal. Meyer's narcosis theory is confirmed by these results.—F. S.

ENGLISH PATENTS.

Tobacco; Process of Treating — J. L. Daniels, jun., New York. Eng. Pat. 8277, April 18, 1905.

TOBACCO leaves are moistened with a solution of sodium hypophosphite and are then exposed in a closed chamber to the direct action of oxygen in the form of ozone. It is claimed that the nicotine is converted by this treatment into harmless nicotinic acid and that the processes of maturing or curing are hastened by the oxidation of the gummy and nitrogenous constituents of the leaves. —J. F. B.

Theobromine; Manufacture of Soluble Compounds of — C. D. Abel, London. From Actien-Ges. für Anilin-Fabrik., Berlin. Eng. Pat. 4959, March 9, 1905.

A READILY soluble compound of theobromine is made by treating barium-theobromine with an alkali salicylate, or by treating sodium-theobromine with an alkali salicylate, in the presence of a soluble compound of barium. On evaporation, a white powder soluble in water is produced. When carbon dioxide is passed through the solution, barium carbonate separates; with ferric chloride there is a violet coloration. On heating with potassium hydroxide ammonia is evolved. —F. S.

Camphor; Manufacture of — A. Zimmermann, London. From the Chem. Fabr. auf Actien (vorm. E. Schering), Berlin. Eng. Pat. 26,779, Dec. 8, 1904.

CLAIM is made for the preparation of camphor by the oxidation of isoborneol esters, more especially isobornyl acetate, with chromic acid or its salts at a temperature of about 90° C. (See Fr. Pat. 341,513 of 1904, this J., 1904, 881. Also this J. 1905, 150 and 750. Eng. Pat. 8297 of 1905, this J. 1905, 857; Eng. Pat. 9550 of 1905, this J., 1905, 902. Fr. Pat. 349,886 of 1904, this J. 1905, 985.) —F. S.

Malonyl-p-phenetidine; Manufacture of Dialkyl Derivatives of — C. D. Abel, London. From Act.-Ges. f. Anilinfabr., Berlin. Eng. Pat. 4564, March 4, 1905.

A DIALKYLALONYLCHLORIDE is heated with somewhat more than 2 mols. of *p*-phenetidine in benzene solution at 100° C. for 1 hour; the precipitate is filtered off, and treated with dilute hydrochloric acid to remove the excess of *p*-phenetidine. The residue, recrystallised from alcohol, gives dialkylmalonyl-*p*-phenetidine, $R_2C(CO.NH.C_6H_4.OCH_2)_2$, a compound sparingly soluble in water. —T. F. B.

m-Iodin-o-oxyquinoline-ana-sulphonic Acid Readily Soluble in the Stomach; Processes for the Preparation of — and *Medicaments or Internal Disinfectants containing the same*. R. Griesse, Berlin. Eng. Pat. 9656, May 8, 1905.

m-IODO-O-HYDROXYQUINOLINE-ANA-SULPHONIC acid (loretin) has previously been applied outwardly only in medicine. It is now found that when mixed with sodium bicarbonate, it is readily soluble in the gastric juices, and is of value as an internal disinfectant. —T. F. B.

Dialkylmalonylurea; Process for Producing — W. Traube, Berlin. Eng. Pat. 14,161, July 10, 1905. Under Int. Conv., July 13, 1904.

WHEN a dialkylmalonyl chloride is heated to 120°–150° C. with 2 mols. of urethane, hydrochloric acid is split off and dialkylmalonyl-diurethane is produced. When this compound is heated with a suitable condensing agent (e.g., sodium ethylate), a molecule of alcohol is eliminated, a carboxylic ester of dialkylmalonylurea being formed. This is not isolated, but the solution is acidified with a mineral acid, when carbon dioxide is evolved, and dialkylmalonylurea is precipitated. —T. F. B.

Alcohols; [Electrolytic] Manufacture of Aromatic — C. Mettler, Munich. Eng. Pat. 18,674, Sept 15, 1905. Under Int. Conv., Nov. 17, 1904.

CARBOXYLIC acids can be reduced electrolytically to the corresponding alcohols, if they are placed in the cathode compartment of an electrolytic cell with a mixture of sulphuric acid and alcohol, the cathode being a plate of pure lead. The anode should be of pure lead, and the anode compartment should contain dilute sulphuric acid. The yield of benzyl alcohol is almost quantitative. (See this J., 1905, 634; and Fr. Pat. 348,951 of 1904, this J., 1905, 559.) —F. S.

UNITED STATES PATENTS.

Camphor; Process of Making — L. Ach, Assignor to C. F. Boehringer und Soehne, Mannheim, Germany. U.S. Pat. 802,792, Oct. 24, 1905.

SEE Eng. Pat. 28,035 of 1904; this J., 1905, 249. —T.F.B.

Camphor; Process of Making — L. Ach, Assignor to C. F. Boehringer und Soehne, Mannheim, Germany. U.S. Pat. 802,793, Oct. 24, 1905.

BORNEOL or isoborneol may be oxidised to camphor by means of "nitrous gases." The gases may be passed over solid borneol, and the liquid, said to be thus formed, saturated with the gases, or a solution of a borneol may be saturated with nitrons gases; the product is allowed to stand for several hours and is then agitated with water. —T. F. B.

Methyleneglycerinsalicylic Acid Ester and Process of Making Same. K. Stephan and T. Emilewicz, Assignors to Chem. Fabr. auf Actien, vorm. E. Schering, Berlin. U.S. Pat. 801,484, Oct. 10, 1905.

METHYLENEGLYCERINSALICYLIC acid ester

is obtained as an oily liquid of sp. gr. 1.344 at 15° C., by the reaction of salicylic acid on a "combination of glycerin and formaldehyde": it is soluble in ether, alcohol, chloroform, benzene, and castor oil, with difficulty soluble in olive and sesame oils, insoluble in water, petroleum spirit and glycerol; it is resolved by acids or alkalis into glycerol, formaldehyde, and salicylic acid. —T. F. B.

Ferric Chloride and Cotarnine Hydrochlorate; Double Salt of — and *Process of Making Same*. A. Voswinkel, Berlin. U.S. Pat. 802,835, Oct. 24, 1905.

FRENCH PATENTS.

Odoriferous Compound [from Citral]; Manufacture of a New — J. Dupont. Fr. Pat. 355,315, June 17, 1905.

CITRAL can be condensed with monochloroacetone in presence of certain condensing agents, such as sodium methylate, sodium amide, or baryta water. For example, 20 grms. of sodium amide are added to a mixture of 1200 grms. of citral, 1200 grms. of monochloroacetone and 4800 grms. of benzene cooled to about 3° C.; the mixture is allowed to stand at a low temperature for some hours, when it is extracted with water, and the aqueous extract extracted with a suitable solvent; this extract is then distilled *in vacuo*, the portion distilling at about 175° C. (12 mm.), being the condensation product, which is odourless. This is converted into a cyclocitral derivative by treatment with a mineral acid (preferably phosphoric acid at below 40° C.), which is fractionated; the new product, which distils between 140° and 150° C. (12 mm.), possesses an intense odour of violets. —T. F. B.

Carbon Tetrachloride; Manufacture of — C. Combes. Addition, dated Aug. 18, 1904, to Fr. Pat. 312,046, June 22, 1901 (this J., 1902, 1469).

It is found that the yield of carbon tetrachloride from the interaction of sulphur monochloride, S_2Cl_2 , and carbon

at a high temperature, is greatly increased by the presence of small quantities of catalysers such as antimony trichloride, phosphorus trichloride, ferric chloride, aluminium chloride, and iodine.—F. S.

Carbon Tetrachloride; Apparatus for the Continuous Production of —. J. B. Febvre. Fr. Pat. 355,423, June 21, 1905.

THIS invention relates to certain improvements of a process for the continuous production of carbon tetrachloride described in Fr. Pat. 327,322 of 1902 (see this J., 1903, 962). The chlorine is made to pass up a column filled with coke impregnated with a catalyser such as manganese chloride and over which carbon bisulphide flows. The sulphur chloride formed thereby is allowed to come in contact with carbon bisulphide vapour in the presence of finely divided iron or a metallic sulphide. The present invention describes the following improvements:—(1) The chlorine is dried by passing up a tower down which sulphuric acid flows, the acid being subsequently heated in the open and used again. (2) The crude carbon tetrachloride, containing sulphur and sulphur chloride, passes into a retort heated by superheated steam. The sulphur is allowed to flow from the base of the retort, and the vapours pass upward through a fractionating column, the sulphur chloride being recovered from the base of this and used again in the process. The last traces of sulphur chloride are removed by passing the vapours through a scrubber in contact with a hot alkaline lye. (3) The use of superheated steam to regulate the temperatures. (4) Receivers at different temperatures to separate the purified product.—F. S.

m-Tolylsemicarbazide; Process for Preparing —. Soc. Anon. Prod. F. Bayer et Cie. First Addition, dated Aug. 29, 1904, to Fr. Pat. 349,968, June 6, 1904. (See this J., 1905, 345, 455.)

THE following additional methods are given for preparing *m*-tolylsemicarbazide:—(1) *m*-tolylhydrazine is treated with cyanogen bromide, and the *m*-tolylhydrazinecarboxylic acid nitrile thus formed, is converted into the hydrochloride of one of its iminoethers by the action of an alcohol and hydrochloric acid gas in ethereal solution; by heating these iminoethers to 130°–140° C., or by treatment with water, *m*-tolylsemicarbazide is produced. (2) By passing hydrochloric acid gas into an ethereal solution of *m*-tolylhydrazinecarboxylic acid nitrile, the chloride of *m*-tolylhydrazinecarboxylic acid imide is produced, which is converted into the semicarbazide on heating with water. (3) The amidine of *m*-tolylhydrazinecarboxylic acid, prepared by the action of cyanamide on the hydrazine, is converted into the semicarbazide by heating with baryta water, or by any other method of substituting oxygen for the imino group. (4) *m*-Tolylazocarbonamide, $C_6H_4(CH_3)N_2CONH_2$, obtained by treating the esters of the carboxylic acid with ammonia, is easily reduced to *m*-tolylsemicarbazide, e.g., by zinc dust and acetic acid.—T. F. B.

m-Iodo-o-hydroxyquinoline-ana-sulphonic Acid; Process of Making —. R. Griese. Fr. Pat. 354,007, May 5, 1905.

Radio-active Surfaces and their Preparation. H. Lieber. Fr. Pat. 355,098, June 8, 1905. Under Int. Conv. July 30, 1904.

THE invention consists of the application of a very thin layer of radium to a solid surface, and subsequently covering this layer with a thin protective layer of a substance through which the radium emanations can pass. For instance, a rod of celluloid can be dipped into

a solution or paste containing radium and, when the solvents have evaporated, it can be dipped in a solution of pyroxylin (see Eng. Pat. 20,922 of 1902; this J., 1903, 1136).—F. S.

p-Aminobenzoic Acid; Manufacture of New Salts of the Ethyl Ester of —. Act.-Ges. f. Anilinabrikation. Fr. Pat. 355,193, June 13, 1905.

NEW salts of the ethyl ester of para-aminobenzoic acid can be produced in the solid state or in solution by the interaction of neutral or acid salts of naphtholsulphonic acid, or the free acid itself, upon a salt of para-aminobenzoic ethyl ester or upon the free ester.—F. S.

Amino-alcohols; Process for the Preparation of Ethers of New —. Farbenfabr. vorm. F. Bayer und Co. Fr. Pat. 355,367, June 19, 1905. Under Int. Conv., Jan. 26, 1905.

BY the action of an organomagnesium halide on a symmetrical dihalogenated acetone, compounds are obtained which are composed by water, with the formation of β -dihaloalcohols, e.g., $RC(OH)(CH_2Cl)_2$, where R represents the organic radical of the original magnesium compound. These compounds react with ammonia or primary or secondary amino compounds, to form the corresponding aminoalcohols or their derivatives. The esters of these aminoalcohols, obtained by the usual esterification processes, are stated to be of technical value.—T. F. B.

GERMAN PATENT.

C.C-Dialkylbarbituric Acids; Process for Preparing —. Farbenfabr. vorm. F. Bayer und Co. Ger. Pat. 162,219, Oct. 22, 1903.

THIOUREA is condensed with a dialkylcyanoacetic ester, and the resulting 2-thio-4,6-dioxypyrimidine derivative is oxidised by nitric acid or by hydrogen peroxide to the corresponding C.C-dialkylbarbituric acid.—T. F. B.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

(Continued from page 1126.)

Silver Bromide-Gelatin containing a Developer. J. Precht and E. Stenger. Z. wiss. Phot., 1905, 3, 76–80. Chem. Centr., 1905, 2, 1137.

THE production of solarisation on exposing silver-bromide gelatin is strongly retarded by the presence of reducing agents, and it is, therefore, advantageous to treat ordinary photographic plates with a 1 per cent. solution of a developer before exposing them. Comparative tests showed that the intensity of illumination required to produce solarisation was 44 times greater with plates which had been treated with a developer than with ordinary plates.—A. S.

Intensification; Use of Permanganates in —. T. T. Baker. Phot. J., 1905, 45, 318–319.

THE negative is immersed from one to three minutes in a solution of potassium permanganate, 2 grms.; hydrochloric acid, 1 c.c.; water, 100 c.c.; rinsed, and redeveloped, preferably with quinol.—T. F. B.

ENGLISH PATENTS.

Photographic Papers; Manufacture of —. J. Hoffsummer, Düren, Germany. Eng. Pat. 17,303, Aug. 26, 1905.

IN order to avoid the penetration of the paper by the emulsion, a thin fibrous layer, such as thin paper, fabric, &c., is fastened by a suitable adhesive to the paper, and the emulsion is then applied in the usual manner, a coating of baryta having been previously applied, if

necessary. This process permits the employment of lower quality paper, since these do not come into direct contact with the emulsion.—T. F. B.

Photographs; Impts. in Polychrome —. C. L. A. Brasseur, New York. Eng. Pat. 21,210, Oct. 3, 1904.

A COLOURED, sensitised gelatin film is fixed to a glass support by means of sodium silicate solution, and an image is printed and developed on it: this image is coated with a soluble layer of gelatin and then with a layer of celluloid or other protective substance. The subsequent images are then applied in the same manner. It is stated to be necessary to colour the gelatin film before development, if satisfactory results are desired. A process for preparing screens is also described and claimed.—T. F. B.

Photographs; Process for Producing Coloured —. G. Koppmann, Hamburg, Germany. Eng. Pat. 24,290, Nov. 9, 1904.

THE reduction in sensitiveness caused by adding pigments to silver bromide and other emulsions in the production of photographs in colour, may be prevented by adding to the emulsion any of the dyestuffs usually employed for preparing orthochromatic plates (e.g., Eosin).—T. F. B.

FRENCH PATENT.

Fibres, Films, Blocks or Slabs; Plastic and Transparent Substance for the Manufacture of —. H. C. M. L. Cathelineau and A. A. René-Fleury. Fr. Pat. 354,942, June 5, 1905. V., page 1169.

FRENCH PATENT.

Phosphorus; Treating Yellow — to Render it Inoffensive. M. Bals. Fr. Pat. 350,114, Aug. 12, 1904.

ORDINARY phosphorus is intimately mixed while in a fused condition or when being condensed from vapour during its production, in a closed vessel, with a salt or other body that may be melted without decomposition, contact of air being prevented, as by conducting the process *in vacuo*, or in an atmosphere of carbon dioxide. Sodium thiosulphate is one of the salts named as being adapted for the described purpose. It is recommended to add during the mixing process, some liquid of low density, such as turpentine or petroleum, to protect the minute coated particles of phosphorus effectively from the air. It is stated that phosphorus thus finely-divided and coated may be transported, and applied in the manufacture of matches, &c., without injury to the work-people.—E. S.

XXIII.—ANALYTICAL CHEMISTRY.

(Continued from page 1130.)

APPARATUS, Etc.

ENGLISH PATENTS.

Condensers; Impts. in —. H. E. Burgess, London. Eng. Pat. 23,336, Oct. 29, 1904.

THE condenser claimed, consists of the three tubes *a*, *b* and *c*. The tubes *a* and *c*, are the cooling tubes and *b* is the condensing tube proper. Claim is made for constructing the apparatus of glass, metal, porcelain, or other suitable material. If of glass a ground joint is used between *a* and *b* and rubber joints between *b* and *c*; if of

metal screwed joints are used, and for porcelain, &c., any suitable joint may be used.—W. H. C.

Titration Apparatus—R. König, Gelsenkirchen, Germany. Eng. Pat. 15,160, July 24, 1905.

The apparatus consists of a reservoir *d* connected by tubes *l* and *m*, with a burette *f*, by means of a cock *g*; *p* and *q* are ground glass joints to enable *d* to be removed from stand *a* when necessary, in which case tap *o* would be closed. The cock *g* is so constructed that in one position it allows both tubes *l* and *m* to communicate with the burette, while in the other position (when the titration is in progress), the burette communicates with the air by a passage in the stopper.—T. F. B.

UNITED STATES PATENT.

Lubricants; Process for the Examination of —. K. Wilkens, Berlin. U.S. Pat. 801,952, Oct. 17, 1905.

SEE Eng. Pat. 20,998 of 1902; this J., 1903, 1065.—T. F. B.

INORGANIC—QUANTITATIVE.

Sulphur in Spent Oxide; Determination of Free —. O. Pfeiffer. J. f. Gasbeleucht., 1905, 48, 977–978.

ONE grm. of the sample (moist or air dried) is burned in a flask filled with oxygen and containing 25 to 50 c.c. of N/1 caustic alkali solution. If the sample does not ignite, owing to the proportion of sulphur being very small (spent oxide containing 3 per cent. of sulphur glows feebly, but the sulphur burns completely), it may be taken out, moistened with glycerin, furnished with a small touch-wick of tinder, the latter set fire to, and the whole replaced in the flask. After the gases produced by the combustion have been completely absorbed, 1 c.c. of strong (30 per cent.) neutral hydrogen peroxide is added to the liquid in the flask, to oxidise any sulphite to sulphate, and the excess of alkali is then titrated by means of N/1 acid and methyl orange. 1 c.c. of N/1 alkali = 0.016 grm. of sulphur. The results are accurate. If hydrogen peroxide is not added, the result may be 20 per cent. too low, as alkali hydrogen sulphite gives a neutral reaction with methyl orange.

—H. B.

Sulphuric and Nitric Acids; Examination of Mixed —. G. Lunge and E. Berl. Z. angew. Chem., 1905, 18, 1681–1687.

IN examining mixed acid, it is necessary to determine (a) total acidity, (b) nitrous acid by permanganate, (c) total nitrogen acids by the nitrometer. Nitric acid is then obtained from the difference of c and b, sulphuric acid from that of a and c. In special cases the sulphuric acid may be directly determined gravimetrically; the nitric acid may also be determined by the "nitron" method, subtracting from the total weight of precipitate obtained that of the "nitron" nitrite ($C_{20}H_{16}N_4 \cdot HNO_2$) calculated from the nitrous acid determined by b—the results, however, are always a little low. The evaporation of the nitrogen acids and determination of the residual sulphuric is not to be recommended, as there is always loss of sulphuric acid by evaporation, so that the sulphuric acid result is too low, and consequently the nitrogen acids too high.—J. T. D.

Sulphur; Determination of — in Iron. J. Petré. Jernkontorets Annaler; through Chem.-Zeit., 1905, 29, Rep., 324.

THE author has examined the different methods for the determination of sulphur in iron, and finds that although the methods in which the sulphur is expelled in the form of hydrogen sulphide are quicker, those in which the sulphur is oxidised directly to sulphuric acid, without separation from the iron, are more accurate. In the method of direct oxidation the carrying down of iron salts by the precipitated barium sulphate is a source of error, but the author has found that this error can be completely prevented by precipitating the barium sulphate in the cold from a solution containing 5–10 c.c. of hydrochloric acid per 200 c.c., and allowing to stand for 24–48 hours.—A. S.

Zinc; Separation of —, from Iron, by Ammonia. W. Funk. Z. angew. Chem. 1905, 18, 1687–1690.

FOR accurate separation a considerable excess of ammonia is requisite. The author's method is as follows:—The solution, containing all the iron as ferric salt, should be

contained in a basin, and not more dilute than necessary. To it is added ammonium chloride, then 10 per cent. ammonia solution to neutral reaction, followed by an excess equivalent to 20–30 times the amount necessary to precipitate the iron. The covered basin is heated to 70°–80° C., the liquid filtered, and the precipitate washed with hot 5 per cent. ammonium chloride solution. The precipitate is dissolved in warm dilute hydrochloric acid, and the precipitation repeated under the same conditions. The zinc in the filtrates may be determined in any of the usual ways. If the iron is to be determined, the ammonium chloride must be first washed out of the precipitate, and after ignition any silica present must be determined. The author considers the acetate method of separation preferable.—J. T. D.

Silver in Blister Copper; Determination of —. C. C. Sample. Eng. and Mining J., 1905, 80, 732.

THE process depends on the separation of the copper by oxidation and solution of the oxide in 10 per cent. sulphuric acid. About 5 grms. of very fine filings or borings are placed in a 20-grm. crucible or 2½ in. scorifier, and heated in a stream of air in the front of the muffle to as high a temperature as possible, short of fusing the particles together. After cooling, the contents are placed in a beaker, and hot, but not boiling, 10 per cent. sulphuric acid poured over, stirred, and kept hot (but not allowed to concentrate). The whole is poured on a filter and the residue washed with hot water. If much copper remains, the treatment must be repeated; but when practically the whole has been removed, lead is added, and fusion for a button and cupellation of the button carried out in the usual way.—J. T. D.

Lead; Rapid Determination of — in the Electrolytic Way. R. O. Smith. J. Amer. Chem. Soc., 1905, 27, 1287–1293.

THE author carried out some experiments on the rapid electrolytic determination of lead as dioxide, using a cathode rotating at a speed of about 450 revolutions per minute. It was found that the maximum time required for the deposition of 0.25 grm. of lead as dioxide was 15 mins., and for 0.5 grm. 25 mins. The results were nearly always slightly too high, the error increasing gradually with the weight of the deposit, with a deposit of about 0.58 grm. of lead dioxide, the amount of lead found was, on the average, 1.5 mgrms. too high (compare Holland, this J., 1903, 216). The deposits did not attain a constant composition until they had been dried at 200°–230° C., the time required varying with the weight of the deposit.—A. S.

Titanium Chloride in Volumetric Analysis; Use of —. E. Knecht and E. Hibbert. XXIII., page 1192.

ORGANIC—QUALITATIVE.

Maple Products, Detection of Cane Sugar in —. A. G. Woodman. Technology Quarterly, 1905, 18, 146–152.

THE author has studied comparatively the value of three methods which have been proposed for testing the genuineness of maple syrups and sugars:—(1) Hortvet's method (this J., 1904, 1241), based on the measurement of the volume of the precipitate produced by basic lead acetate and alumina cream under standard conditions. (2) Hill and Mosher's method:—50 c.c. of syrup are diluted with 200 c.c. of water, and treated gradually with slight excess of a saturated solution of normal lead acetate. The precipitate is filtered off, washed until free from soluble lead salts and then decomposed by sulphuretted hydrogen and water; the organic acid present in the filtrate from the lead sulphide is then determined by titration. (3) In C. H. Jones' method for testing the purity of maple products, about 5 grms. of syrup or sugar are incinerated; the ash is weighed, extracted with boiling water, filtered and washed. The weight and alkalinity of the soluble and insoluble portions of the ash are determined separately. According to Hortvet's method the volumes of the precipitates with pure maple products vary from 0.94 to 1.82 c.c. for syrups,

and from 1.18 to 4.41 c.c. for sugars. According to Hill and Mosher's method, genuine maple syrup gives a nearly colourless filtrate from the lead sulphide, whilst other syrups give brown or black filtrates. The filtrates from maple syrups have an acidity equivalent to 30–35 c.c. of N/10 acid per 100 c.c. of syrup, whilst those which are not maple, or which are mixtures of maple and cane syrups have a very much lower acidity. According to Jones, the ash of a pure maple syrup is not lower than 0.5 per cent. on the basis of 11 lb. of syrup to the gallon.

The author regards the Hortvet method as an excellent process for rapidly sorting out the genuine from the suspected samples. The latter should then be tested by the other two processes before a conclusion is formulated. The Hill and Mosher method gives reliable results in the case of syrups, both as regards the colour and the acidity of the filtrate; with sugars the colour of the filtrate is not reliable, but the acidity is characteristic. The most conclusive data seem to be afforded by the determination of the ash, especially of the soluble and insoluble portions and their respective alkalinities.—J. F. B.

Sugars; Some Colour and Spectral-Reactions of the Principal —. E. Pinoff. Ber., 1905, 38, 3308–3318.

THE following reactions enable certain sugars to be identified either alone or in mixtures, provided the proportions and conditions of heating be observed. In all the tests the liquid is heated in test-tubes in the water-bath at 95°–98° C., and in all cases where alcohol is specified it is of 96 per cent. strength:—

(1) 0.05 grm. of sugar, 10 c.c. of alcohol-sulphuric acid mixture (750 c.c. of alcohol and 200 c.c. of concentrated sulphuric acid) and 0.2 c.c. of a 5 per cent. alcoholic solution of α -naphthol:—Levulose, sorbose, cane sugar and raffinose give a coloration after heating for one minute, showing two absorption bands with mean wave lengths of 5736 and 5088 μ respectively. Dextrose, mannose, galactose, lactose and maltose give a coloration after 30–35 minutes, with one absorption band, 5325 μ ; rhamnose reacts in 20 minutes, absorption band, 5625 μ ; arabinose gives a dull greenish coloration with no absorption band.

(1A) Same reagent as (1), diluted with 10 c.c. of alcohol:—Levulose, cane sugar and raffinose react in 13–19 minutes, sorbose in 30 minutes, giving for each a coloration with only one absorption band, 5088 μ ; the other sugars show no reaction in 30 minutes.

(2) Same proportions as (1A), but the α -naphthol is replaced by β -naphthol. Levulose reddish-brown, sorbose greenish-yellow after 25 minutes; other sugars *nil* after 45 minutes.

(2A) Same proportions as (1), but using β -naphthol instead of α -naphthol:—Levulose, cane sugar and raffinose, reddish-brown after four minutes, absorption band 5050 μ ; sorbose, yellow after four minutes, no absorption band, other sugars *nil* after 15 minutes.

(3) 0.05 grm. of sugar, 5 c.c. of alcohol-sulphuric acid, 5 c.c. of alcohol, 0.2 c.c. of a 5 per cent. solution of resorcinol:—Levulose, sorbose, cane sugar and raffinose, after one minute, dextrose, lactose and maltose, after 32 minutes, absorption band in all cases 4875 μ . Arabinose, rhamnose, mannose and galactose, no reaction after 35 minutes.

(4) 0.1 grm. of sugar, 5 c.c. of a 5 per cent. solution of potassium bichromate and 5 c.c. of a 5 per cent. solution of ammonium chloride, heated for 30 minutes. Sorbose gives a yellow precipitate after 12 minutes, levulose after 20 minutes, other sugars give no precipitate. This is a very reliable test for sorbose and levulose in mixtures.

(5) 0.1 grm. of sugar, 10 c.c. of a 4 per cent. solution of ammonium molybdate, 10 c.c. of water, 0.2 c.c. of glacial acetic acid; the total absence of free mineral acid must be ensured. Levulose, after three minutes' heating, gives a fine blue coloration; arabinose, rhamnose, galactose, mannose and sorbose give a faint greenish (not blue) coloration only after heating for 30 minutes. This is a characteristic test for levulose in mixtures; it is important that the total dilution of the test liquid should not be increased. With very small quantities of levulose in the mixture, 10–25 minutes

may be required to develop the coloration; this reaction may possibly form the basis of a colorimetric method for the quantitative determination of levulose.—J. F. B.

Wood Spirit; Detection of — in Alcoholic Preparations.
R. Peters. Pharm. Centralh., 1905, 46, 521.

ACETONE being invariably present in wood spirit, Légal's reaction with sodium nitroprusside in the presence of alkali is employed for its detection. Ten c.c. of the alcoholic liquid are diluted with water and slowly distilled, until 20 c.c. of distillate have been obtained. Ten c.c. of this are then treated with 1 c.c. of freshly prepared 1 per cent. sodium nitroprusside solution, which has been protected from the light, and 2 c.c., or an excess, of 4 per cent. caustic soda solution. In the presence of acetone, a red colour is developed, becoming brown after a certain time. In its absence, the colour is merely yellow.

Since aldehyde and fusel oil give a similar reaction with the test, they must be destroyed, if present. The former is eliminated by heating 10 c.c. of the above distillate with 20 c.c. of 25 per cent. caustic soda solution and a little water on the water-bath (under the reflux condenser) for one hour. The liquid is then filtered through cotton wool and distilled, the distillate being then tested as above. To remove fusel oil, the first distillate is heated on the water-bath for one hour, under a reflux condenser, with granulated zinc and dilute sulphuric acid, with one drop of platonic chloride solution added. It is then distilled and tested.—J. O. B.

ORGANIC—QUANTITATIVE.

Titanium Chloride in Volumetric Analysis; Use of —.
E. Knecht and E. Hibbert. Ber., 1905, 38, 3318–3326.

IN continuation of their previous work (see J. Soc. Dyers and Colourists, 1904, 3), the authors describe the volumetric estimation of indigo, and of basic dyestuffs such as Fosine A, Rhodamine B, Crystal Violet, Pararosaniline hydrochloride and Tolusafuranine, &c., which are reduced by titanium chloride. Two atoms of hydrogen are taken up as a rule, and the colourless leuco bodies formed. The dyestuffs thus act as their own indicator; the end of the reaction being shown by the solution becoming colourless. Owing to the tendency of the leuco bodies to oxidise, the titration is carried out in a current of carbon dioxide. The method adopted for the analysis of synthetic, and high grade natural indigos is as follows:—

1 grm. of indigotin is sulphonated with 5 c.c. of concentrated sulphuric acid at 90°–95° C. for one hour; the product is poured into water, and diluted to 500 c.c. 50 c.c. of this solution are poured into an Erlenmeyer flask closed with a perforated rubber stopper, and 25 c.c. of a 20 per cent. solution of Rochelle salt are added. Three glass tubes pass through the india-rubber stopper; one serves for the introduction of a regular stream of carbon dioxide, the second as an exit tube, and the third is connected with the titanium chloride burette. The indigo solution is first boiled, and, after the air has been expelled by carbon dioxide, is then titrated with the standard titanium solution, until the blue colour turns to yellow. Seignette salt is added because a sharp end reaction is only obtained in tartaric acid solution. With low grade indigos, such as Kurpah, the diluted solution in sulphuric acid must first be purified by the addition of chalk (see Grossmann, this J., 1905, 308) before titrating.

The above is stated to be quicker than the gravimetric method; and the end reaction sharper than in the permanganate method. The following table shows the comparative results obtained:—

Quality of Indigo.	TiCl ₃ .	KMnO ₄ (Rawson).	Gravimetric (Möhlau and Zimmermann).
Bengal I.	59.08	59.14	58.5
Bengal II.	55.97	56.00	57.0
Kurpah	35.32	—	36.0

The authors further describe the estimation of hydrogen peroxide, ammonium persulphate, metallic tin and tin salts by means of titanium chloride.—H. L.

Rubber; New Method of Determining — J. Torrey. India-Rubber J., 1905, 30, 417—418.

THE method proposed, a colorimetric one, is founded on the fact that when rubber is heated with pure nitric acid of sp. gr. 1.42 under constant conditions, it is converted into a body which dissolves completely in caustic alkaline solutions with production of a deep red colour. The author states moreover that the same weight of pure rubber, when treated as described, and diluted with water to a definite volume, always gives the same tint. Certain of the organic substances used in compounding interfere, and must be removed before the test is made by means of such extracting agents as acetone, pyridine, and alcoholic caustic soda.

The colour standard is prepared as follows:—0.1 gm. of pure rubber is heated with 2 c.c. of pure nitric acid (1.42) in a test-tube immersed in a water-bath, first at 50° to 60° C. until action ceases, and then at 95° to 100° C. for 20 minutes. The liquid is diluted with 10 c.c. of water, 20 c.c. of caustic soda solution (1 in 4) are added, the liquid stirred, again diluted with 10 c.c. of water, filtered, and the filtrate and washings diluted to 250 c.c. Of this standard solution 100 c.c. are transferred to a test-tube for the purpose of comparison with the solution obtained from the sample under examination. This is prepared in the same manner, 0.1 gm. of the residue after extraction, being used. The filtrate and washings are transferred to a similar test-tube to that used for the standard, and the colour matched by dilution with water.

Then if P = required percentage of rubber in original mixing, V = volume of solution under test at standard tint, and a = percentage of extraction residue in original mixing, then $P = aV/250$.

Duplicate results agreed within 0.5 per cent.—E. W. L.

Coca Leaves; Analysis of Javan — M. Greshoff. Pharm. Weekblad, 1905 [13]; through Apoth. Zeit., 1905, 20, 291.

THE total solid alkaloids, chiefly cinnamylecocaine, are first converted into ecgonine, which is then transformed into ordinary cocaine.

30.5 grms. of dried and powdered coca leaves are heated on the water-bath at about 80° C. for two hours, in a flask attached to an upright condenser, with 300 c.c. of 90 per cent. alcohol, the weight of the flask and its contents having been previously noted. After cooling, the flask and contents are again weighed, and any loss is made up by the addition of more alcohol. Exactly 150 c.c., equivalent to 15 grms. of leaves, are then filtered, and the spirit is distilled off. The residue is warmed on the water-bath with 20 c.c. of water, with frequent agitation. After cooling, the liquid is filtered, the insoluble waxy and other matter and chlorophyll being washed with tepid water until the total filtrate measures about 60 c.c. This aqueous filtrate is shaken with two successive washings each of 30 c.c. of ether which are rejected; it is then made alkaline with ammonia, and the liberated alkaloid is shaken with three successive quantities each of 30 c.c. of ether. The bulked ethereal extract is distilled in a small tared flask, and the residue dried in the water-oven, a rapid current of air previously dried over calcium chloride being aspirated through the flask during this drying, to remove traces of a volatile base, with a strong tobacco-like odour. The brown amorphous residue thus obtained is redissolved in a little 10 per cent. solution of sulphuric acid, again liberated with ammonia and shaken out, as before, with ether. After distilling off the solvent the residual alkaloid is dried for three hours at 95° C. and weighed.

Young Javan coca leaves, protected from the air while drying, gave 2.02 per cent. of alkaloid. Old leaves, similarly dried, gave only 0.78 per cent., thus confirming the observation that the younger leaves contain more than twice as much alkaloid as older ones do. It is further found that the leaves from the summits of young trees yield more alkaloid than those from the base, 2.1 per

cent. being obtained from the former and 1.2 per cent. from the latter. Although the method of drying and the period of storage adversely affect the alkaloidal value of the leaves, the commercial product should yield at least 0.6 to 0.7 per cent. of alkaloid.—J. O. B.

Aldehydes and Ketones in Essential Oils; Fuller Study of the Neutral Sulphite Method for Determining some — S. S. Sadtler. J. Amer. Chem. Soc., 1905, 27, 1321—1327.

THE author describes some further work on his method for the determination of some aldehydes and ketones in essential oils, by titrating the alkali produced by the action on the oil of normal sodium sulphite (this J., 1904, 303, 387). Reference is made to a paper by Burgess (this J., 1901, 1176; 1901, 387), and the author confirms most of the results obtained by that author, but finds that carvone reacts with 2 mols. of sulphite instead of with 1 mol., as stated by Burgess, whilst citronellal does not react at all, any slight action observed being probably due to the presence of small quantities of citral. Of the compounds examined, citral, cinnamic aldehyde, carvone, pulegone and formaldehyde each reacted with 2 mols. of sulphite, and benzaldehyde and vanillin each with 1 mol., whilst citronellal, camphor, menthone and fenchone did not react at all. In the determination of benzaldehyde, the reaction must be carried out entirely in the cold and with violent agitation. A relatively large quantity of rosolic acid or phenolphthalein must be added, and the titration with acid must be continued until the very faint pink colour completely disappears. The solution should be allowed to stand overnight to see if any additional alkali is formed.—A. S.

XXIV.—SCIENTIFIC & TECHNICAL NOTES.

(Continued from page 1131.)

Radio-active Element; New — Emitting Thorium-Emanation. O. Hahn. Ber., 1905, 38, 3371—3375.

THIS substance is separated from the barium-radium mixture by treating each radium fraction with a drop of ferric chloride and precipitating with ammonia. Repetition of this treatment effected a satisfactory separation of the new element from radium, and precipitation by ammonium carbonate in excess was resorted to in order to separate it from iron. The small quantity available prevented exact separation, and the final product was a dirty-brown, obviously not uniform, substance, yielding 700,000 times as much emanation as ordinary thorium. It is not thorium X, for its activity is not lessened even after six months; but thorium X seems to be the first product of its disintegration, and can be separated from the portion of constant activity by precipitation with ammonia. The emanation gave a value for λ , the disintegration-constant, of 1.3×10^{-2} , or falls to half value in 53.3 seconds. It gives very marked appearances in the dark room on a zinc sulphide screen; it rises in air, while the radium-emanation sinks. After igniting the substance no emanation is for the time being observed, but the total activity is increased; the same is the result of immersing the substance in liquid air. The substance is not self-luminous, but the glass vessel containing it fluoresces visibly in a dark room. Substances brought near to it become strongly radio-active by induction, and show the scintillation of the α -rays brilliantly. The constant for the falling off of this induced activity is $\lambda = 1.82 \times 10^{-5}$; the time of falling to half value is 10.6 hours. The chemical properties of the substance have been little investigated, owing to the small amount available, but it appears to belong to the rare earths. The author calls it "Radiothorium," and regards it as the cause of the activity of ordinary thorium compounds, thorium itself being inactive. (See also this J., 1905, 640.)—J. T. D.

Phenolic Compounds Insoluble in Aqueous Alkalis; A Class of — M. Rogow. J. prakt. Chem., 1905, 72, 315—322.

THE condensation of the three hydroxybenzaldehydes

and also of vanillin, with β -naphthol or β -naphthylamine produces a series of phenolic compounds, substituted dinaphthoxanthenes and dinaphthaeridines, which are insoluble in cold solutions of alkali hydroxides, and only very sparingly soluble in hot solutions.—T. F. B.

Esterification; Studies on —. A. Bogojawlensky and J. Narbutt. Ber., 1905, 38, 3344—3353.

THE authors have studied the influence of various water-absorbing salts on the limits of the esterification equilibria between a large number of organic acids and ethyl alcohol when boiled for several hours. The majority of the experiments were made with dehydrated copper sulphate and potassium pyrosulphate, but a few observations are recorded for the dehydrated sulphates of other metals. The heat necessary for the expulsion of the water of crystallisation, had also a tendency to liberate sulphuric anhydride from certain of these sulphates, the presence of which had an important effect in raising the limits of esterification. The influence of the dehydrated salt alone was determined in such cases by purifying the salt after heating, by extraction with alcohol. The investigations have shown that potassium pyrosulphate has a favourable influence in increasing the yields of esters both with aliphatic and aromatic acids, but that copper sulphate only affords good results in the case of acids of the aliphatic series. In nearly all cases the presence of a little free sulphuric acid in addition to the dehydrated salt raises the limit of esterification beyond that obtained with the acid or the salt alone, and this effect is so marked that a mixture of copper sulphate and free sulphuric acid gives good yields of esters even with acids of the aromatic series. The quantity of dehydrating agent employed was always rather more than was necessary to absorb the water liberated in the course of the reaction.—J. F. B.

New Books.

SOILS AND FERTILIZERS. By HARRY SNYDER, Professor of Agricultural Chemistry, University of Minnesota, &c. Second Edition. The Chemical Publishing Co., Easton, Pa., 1905. Price \$1.50.

8vo volume, containing 287 pages of subject matter, and the alphabetical index. There are 40 illustrations. The entire subject is classified as follows:—I. Physical Properties of Soils. II. Geological Formation and Classification of Soils. III. Chemical Composition of Soils. IV. Nitrogen of the Soil and Air, Nitrification and Nitrogenous Mannres. V. Farm Mannres. VI. Fixation. VII. Phosphate Fertilizers. VIII. Potash Fertilizers. IX. Lime and Miscellaneous Fertilizers. X. Commercial Fertilizers. XI. Food Requirements of Crops. XII. Rotation of Crops. XIII. Preparation of Soils for Crops. XIV. Laboratory Practice.

THE ELEMENTS OF PHYSICAL CHEMISTRY. By J. LIVINGSTON R. MORGAN, Ph.D., Professor of Physical Chemistry, Columbia University. Third Edition. John Wiley and Sons, New York; Chapman and Hall, Ltd., London. 1905. Price 12s. 6d. nett.

12mo volume, containing 502 pages of matter and the alphabetical index. There are 21 illustrations. The text is subdivided as follows:—I. Introductory Remarks. II. The Gaseous State. III. The Liquid State. IV. The Solid State. V. The Phase Rule. VI. Solutions. VII. Thermo-chemistry. VIII. Chemical Change. IX. Electro-chemistry.

TECHNICAL METHODS OF ORE ANALYSIS. By ALBERT H. LOW, B.S. John Wiley and Sons, New York; Chapman and Hall, Ltd., London. 1905. Price 12s. 6d.

8vo volume, containing 264 pages of subject matter, with a Supplementary Note covering two additional pages. There is an alphabetical index of subjects, and in the text 14 illustrations. The subject matter is classified as follows:—I. Apparatus. II. Electrolysis. III. Logarithms. IV. Aluminium. V.—VIII. Antimony; Arsenic; Barium; and Bismuth. IX.—XIX. Cadmium; Calcium; Chlorine; Chromium; Copper; Iron; Lead; Magnesium; Manganese; Mercury; Molybdenum. XX.—XXIX. Nickel and Cobalt; Phosphorus; Potassium and Sodium; Silica; Sulphur; Tio; Titanium; Tungsten; Uranium and Vanadium; Zinc. XXX. Combining Determinations. XXXI. Boiler Water. XXXII. Coal and Coke. XXXIII. Testing Crude Petroleum. A series of tables is given on pages 249—259.

DIE MIKROSKOPIE DER TECHNISCH VERWENDETEN FASERSTOFFE. Ein Lehr- und Handbuch der Mikroskopischen Untersuchung der Faserstoffe, Gewebe und Papiere. Bearbeitet von Dr. FRANZ RITTER v. HÖHNEL, K.K. Professor an der technischen Hochschule in Wien. 2^{te} Auflage. A. Hartleben's Verlag. Wien und Leipzig. 1905. Price M.6.

8vo volume, containing 234 pages of subject matter, 6 pages with references to literature, and the alphabetical index of names and subjects. There are 94 illustrations. The arrangement of the matter is as follows:—I. Vegetable Fibres. II. Animal Wools, Fur and Hairs. III. Fibres resembling Silk, Mineral Fibres, Artificial Silk. Finally, an Index to the Literature of the Subject.

BIBLIOTHEK DES BETRIEBSLEITERS. ERSTER BAND. Die Betriebsmittel der Chemischen Technik, von Dr. GUSTAV RAUTER. Dr. Max Jänecke's Verlagsbuchhandlung, Osterstrasse, Hannover. 1905. Price M.13, Bound M. 14.

THIS work forms the first volume of a series to be devoted to Chemical Engineering. It fills a large 8vo volume, occupying 537 pages, with 617 illustrations, and followed by an alphabetical index. The subject matter is subdivided and classified as follows:—A. General and Introductory. B. Building. C. Furnaces and Firing, Heating Arrangements, Regenerators and Gas Firing Apparatus, Boilers, &c. D. Power Machinery. E. Machinery to be worked by transmitted Power. Transmission Power Pumps, Compressors, &c. F. Materials and Appliances of various kinds for fitting up plant and machinery. G. Chemical Apparatus, in the more limited sense, such, e.g., as Filter-presses, Hydraulic Presses, Crystallisation Apparatus, Centrifugal Machines, &c.

Trade Report.

(Continued from page 1135.)

I.—GENERAL.

IMPORT DUTIES; COLONIAL —. 1905. [Cd. 2627].

This return relating to the rates of import duties levied upon various articles imported into the British Colonies, is sub-divided as follows:—Yarns and thread; woven manufactures; metals; earthenware and porcelain; bricks and tiles; glass and glassware; hides, skins and leather; indiarubber and guttapercha; paper, &c.; paints, colours and varnishes; chemicals; dyeing and tanning materials; oils, fats, resins, &c.; earth, stone, minerals, &c.; animals and other live stock; food; wood and timber; miscellaneous articles.

In the appendix are given rates of duty in the British Protectorates and in Cyprus.

III.—TAR PRODUCTS, PETROLEUM, Etc.

PETROLEUM INDUSTRY AT BAKU.

Bd. of Trade J., Nov. 9, 1905.

H.M. Consul at Batoum reports that the areas recently laid waste by fires are being rapidly built over, about 150 new derricks being already erected on the Balakhani field. At Romani and Sabunchi the work of restoration is being actively carried on. All oil and water pipe-lines, storage accommodation, engines, pumps and boiler houses, are being overhauled and repainted, and otherwise placed in a state of efficiency.

The Governor-General has promised to comply with certain suggestions made by the Council of Petroleum Producers for safeguarding the workers on the oil fields, and it has been decided to resume work.

VII.—ACIDS, ALKALIS, Etc.

SULPHUR IN JAPAN.

Eng. and Mining J., Oct. 28, 1905.

The sulphur output of Japan has grown from 10,000 tons in 1900 to above 20,000 tons in 1904, and is likely to grow still further. Domestic consumption takes only a quarter of the output, the consuming industries being the manufacture of matches, explosives and chemicals. As the price of native sulphur advances, pyrites is being imported, the supply coming mainly from Australia.

Exports amount to 14,000 or 15,000 tons per year, the western coast of the United States and Australia being the largest consumers; Hakodate is the usual shipping port, although Kobe and Nagasaki ship small quantities to China.

Recent quotations have been 3*l.* 10*s.* per ton for the best grades, and 3*l.* 2*s.* for inferior grades, with variation of 2*s.* per ton, according to method of packing.

In northern Japan, snow interrupts activities for five months in the year. The ore is put into iron receptacles and heated to 115° C. The Mitsui company, a few years ago, introduced modern Gill's furnaces such as are used in Sicily.

The yield of sulphur from Japanese ore is probably the highest in the world. It reaches 50 per cent. in the north, where ore of less than 38 per cent. is rejected. In Sicily, with modern furnaces, 20 per cent. ore is considered workable.

X.—METALLURGY.

INVAR: U.S. CUSTOMS DECISION.

Oct. 27, 1905.

The Board of General Appraisers overruled the assessment of duty at 45 per cent. *ad valorem* under paragraph 193 as "manufactures of metal" on certain *invar*, a newly introduced alloy of nickel and steel. The claim of the importers that it was dutiable at 6 cents per lb. as an "alloy in which nickel was the component material of chief value" under paragraph 185, was sustained.—R. W. M.

FERRO ALLOYS: U.S. CUSTOMS DECISION.

Following a decision of the United States Circuit Court of Appeals which was acquiesced in by the Treasury Department, the Board of General Appraisers held that ferro chrome, ferro phosphate, ferro titanium, ferro tungsten, ferro vanadium and other similarly constituted materials, are dutiable by similitude to ferro manganese at 4 dols. per ton under paragraph 122 of the tariff. The Court overruled the assessment of duty at 20 per cent. *ad valorem* under paragraph 183 as "metals unwrought," on the ground that the articles were not capable of being wrought by themselves.—R. W. M.

XII.—FATS, FATTY OILS, Etc.

COCOANUT OIL: U.S. CUSTOMS DECISION.

Oct. 17, 1905.

The Treasury Department has decided not to appeal from the decision of the United States Circuit Court making refined coconut oil free of duty as "coconut oil" under paragraph 626 of the tariff. Duty had been assessed as "cocoa butterine," at 3½ cents per lb., under paragraph 282.—R. W. M.

OLIVE OIL: U.S. CUSTOMS DECISION.

Oct. 25, 1905.

Olive oil, intended for use as a table oil after refining and blending with cottonseed oil, is free of duty as "olive oil for manufacturing or mechanical purposes, fit only for such use," under paragraph 626 of the tariff. The Board held that at the time of importation the oil was unfit for use as food and hence not subject to duty.

—R. W. M.

CASTOR OIL PRODUCTION OF CAPE COLONY.

Bd. of Trade J., Nov. 2, 1905.

The "Agricultural Journal" of the Cape of Good Hope remarks that the constant appearance of the castor oil plant as a weed in the waste lands of the Colony, has more than once directed attention to the possibility of its profitable cultivation for commercial purposes, but nothing very definite ever seems to have been attempted. There are initial difficulties in the way, and an industrial problem has to be faced as well; but when it is considered that the Railway Department of the Colony alone spends some 8,000*l.* a year on castor oil for lubricating purposes, there should be some prospect of a fair return if the question were dealt with in a business-like manner. The Railway Department is prepared, if it could obtain a supply of suitable castor oil produced in the Colony, to give a small preference in point of price over the imported article in order to encourage the industry. An investigation as to the varieties most suitable is to be initiated next year.

XIII.—RESINS, VARNISHES, Etc.

SOAP VARNISH IN THE NETHERLANDS; EXEMPTION FROM IMPORT DUTY OF —.

Bd. of Trade J., Nov. 2, 1905.

A Dutch Royal Decree dated 11th September, 1905, exempts from import duty, subject to certain conditions, soap varnish imported for the exclusive purpose of varnishing metal objects in factories, &c.

XVI.—SUGAR, STARCH, Etc.

STARCH; ARROWROOT —: U.S. CUSTOMS DECISION.
Oct. 25, 1905.

The United States Circuit Court decided that ordinary arrowroot, chiefly used for infants' food and in the manufacture of medicinal preparations, is dutiable as "starch," at 1½ cents per lb., under paragraph 285 of the tariff. The claim of the importer for free entry under paragraph 478, as "arrowroot in its natural state and not manufactured" was overruled.—R. W. M.

XVII.—BREWING, WINES, SPIRITS, Etc.

ALCOHOLIC COMPOUND [FORTIFIED LEMON JUICE]: U.S. CUSTOMS DECISION.

On June 15th, 1892, the United States Circuit Court held that lemon juice fortified by the addition of 7-5 per cent. of alcohol was free of duty as "lemon juice," under

paragraph 543 of the tariff of 1883. The assessment of duty at 2 dols per gal. and 25 per cent. *ad valorem*, under paragraph 103 of the same tariff act was overruled on the ground that the addition of the alcohol did not destroy the identity of the article as lemon juice. The Treasury Department has acquiesced in this decision.—R. W. M.

XVIII.—DISINFECTANTS.

SHEEP DIP: U.S. CUSTOMS DECISION. Oct. 18, 1905.

Little's Sheep Dip, a compound of coal tar distillates, rosin, rosin oil, soap and water, is dutiable at 20 per cent. *ad valorem*, as a "preparation of coal tar, not a colour or dye," under paragraph 15 of the tariff. The claim of the importer that it was free of duty as "sheep dip," under paragraph 657 was overruled on the ground that it was used for purposes other than dipping sheep and was recommended for internal use for horses. The assessment of duty at 25 per cent. *ad valorem*, as a "chemical compound" under paragraph 3, was also overruled and the duty fixed as above stated. Another importation of a similar article, known as *sulfo breal argentino* was the subject of another decision to the same effect.—R. W. M.

Patent List.

N.B.—In these lists, [A.] means "Application for Patent," and [C.S.] "Complete Specification Accepted."

Where a Complete Specification accompanies an Application, an asterisk is affixed. The dates given are (i) in the case of Applications for Patents, the dates of application, and (ii) in the case of Complete Specifications Accepted, those of the Official Journals in which acceptances of the Complete Specifications are advertised.

Complete Specifications thus advertised as accepted are open to inspection at the Patent Office immediately, and to opposition within two months of the said dates.

Past Presidents :

Sir Henry E. Roscoe, B.A., D.C.L., LL.D., Ph.D., F.R.S.	1881—1882.
†Sir Frederick A. Abel, Bart., K.C.B., G.C.V.O., D.C.L., D.Sc., F.R.S.	1882—1883.
†Walter Weldon, F.R.S.	1883—1884.
W. H. Perkin, LL.D., Ph.D., F.R.S.	1884—1885.
E. K. Muspratt	1885—1886.
David Howard	1886—1887.
Sir James Dewar, M.A., LL.D., F.R.S.	1887—1888.
Ludwig Mond, Ph.D., F.R.S.	1888—1889.
†Sir Lowthian Bell, Bart., F.R.S.	1889—1890.
†E. Rider Cook	1890—1891.
J. Emerson Reynolds, M.D., F.R.S.	1891—1892.
Sir John Evans, K.C.B., D.C.L., LL.D., Sc.D., F.R.S.	1892—1893.
†E. C. C. Stanford	1893—1894.
T. E. Thorpe, C.B., LL.D., Sc.D., Ph.D., F.R.S.	1894—1895.
Thomas Tyrer	1895—1896.
†Edward Schunck, Ph.D., F.R.S.	1896—1897.
Frank Clowes, D.Sc.	1897—1898.
George Beilby	1898—1899.
C. F. Chandler, D.Sc., M.D., Ph.D., LL.D.	1899—1900.
Sir Jos. W. Swan, D.Sc., M.A., F.R.S.	1900—1901.
Ivan Levinstein	1901—1903.
Sir W. Ramsay, K.C.B., D.Sc., LL.D., F.R.S.	1903—1904.
Wm. H. Nichols, M.S., LL.D., D.Sc.	1904—1905.

† Deceased.

LIST OF COUNCIL, 1905—1906.

President : Dr. Edw. Divers, F.R.S.

Vice-Presidents :

Dr. L. Baekeland.	Dr. J. Lewkowitsch.
J. Carter Bell.	N. H. Martin.
Dr. Virgil Coblenz.	Max Muspratt.
Prof. W. R. E. Hodgkinson.	Dr. Wm. H. Nichols.
David Howard.	T. J. Parker.
Ivan Levinstein.	Sir Wm. Ramsay, K.C.B., F.R.S.

Ordinary Members of Council :

Dr. J. T. Dunn.	Dr. K. E. Markel.
Oscar Guttman.	B. E. R. Newlands.
H. Hemingway.	Prof. W. J. Pope, F.R.S.
Prof. W. R. Lang.	Sir Boverton Redwood.
A. R. Ling.	Walter F. Reid.
J. S. McArthur.	Dr. W. S. Squire.

Sectional Chairmen and Secretaries :

Prof. Percy F. Frankland, F.R.S.	BIRMINGHAM.	F. R. O'Shaughnessy.
Dr. F. J. Smale.	CANADIAN.	Alfred Burton.
Eustace Carey.	LIVERPOOL.	W. Roscoe Hardwick.
A. Gordon Salamon.	LONDON.	Julian L. Baker.
Dr. G. H. Bailey.	MANCHESTER.	Julius Hübner.
Prof. H. Louis.	NEWCASTLE.	Dr. F. C. Garrett.
Henry Howard.	NEW ENGLAND.	Alan A. Claflin.

Official Notices. COMMUNICATIONS.

Authors of communications read before the Society, or any of its Local Sections, are requested to take notice that under Rule 43 of the Bye-laws the Society has the right of priority of publication for three months of all such papers. Infringement of this Bye-law renders papers liable to be rejected by the Publication Committee, or ordered to be abstracted for the Journal, in which case no reprints can be furnished to the author.

SIXTH INTERNATIONAL CONGRESS OF APPLIED CHEMISTRY, ROME, 1906.

The Sixth International Congress of Applied Chemistry will be held in Rome in April, 1906, during Easter week. All communications should be addressed to the General Secretary, Prof. Vittorio Villavecchia, Via Panisperna, 89, Rome.

Members are reminded that the subscription of 25s. for 1906, payable on January 1st next, should be sent in good time to the Hon. Treasurer (Mr. Samuel Hall) in order to ensure continuity in the receipt of the Society's Journal. Any changes of address for the new List of Members now in course of preparation should reach the General Secretary not later than January 31st, 1906.

DECENNIAL INDEX, 1896-1905.

A Collective Index to the first fourteen volumes of the Journal (1882-1895), a volume of 550 pages, was published in 1899; a few copies of this are still left, price 10s. A second volume, embracing the period 1896-1905, is now in preparation, and will be ready for printing in 1906. It will contain both a subject matter and authors' names portion, and will be a volume of about 900 pages, uniform in size with the Journal. As the number of copies to be printed will depend on the number of applications from members, the Treasurer is prepared to receive subscriptions at the rate of 10s. each copy. A form of application for this purpose will shortly be issued.

Changes of Address.

When notifying new addresses, members are requested to write them distinctly, and state whether they are temporary or permanent. Multiplication of addresses is also to be avoided as tending to create confusion. When sending subscriptions, the use of the form attached to the application helps in the verification of addresses, on which the safe delivery of the Journal depends.

MR. A. GORDON SALAMON IN THE CHAIR.

THE TEMPERATURE OF COMBUSTION OF METHANE IN THE PRESENCE OF PALLADIUMISED ASBESTOS.

BY H. G. DENHAM, M.A.

For the determination of the amount of hydrogen present in a gaseous mixture by passing it over palladiumised asbestos, most of the text books recommend the heating of the capillary tube with a naked flame, but state that a visible redness or softening of the glass must be avoided. The question immediately presents itself whether, even if these conditions are complied with, considerable quantities of methane may not be burnt, and the analysis vitiated. It was to determine to what extent methane is burnt when passed over palladium asbestos in presence of oxygen that the following experiments were carried out.

Literature.

In Winkler's "Handbook of Technical Gas Analysis," (2nd edition, translated by Lunge), it is stated that "methane is not burnt at all," when passed over palladium asbestos kept heated by a naked flame, and even in the presence of considerable excess of easily combustible gases, there is no methane, or at most, extremely slight traces of it burned along with them.

Hempel ("Gas Analytische Methoden" (1900) p. 160), mentions that methane, passed with oxygen through a capillary tube containing palladium asbestos does not burn at all up to 100° C. The combustion begins at about 200° C. A mixture of 29.3 c.c. of methane and 70.6 c.c. of oxygen at a temperature of 200°-220° C. gave a contraction of 3 c.c. Summing up, he says that "if the temperature be higher than 200° C., a portion of the methane is burnt as well as the hydrogen."

In a thesis by F. C. Phillips (Amer. Chem. Journ. 16, 163-187), the temperature of oxidation of methane by palladiumised asbestos is given as 404°-414° C. He also

states that, as the temperature rises, a point is reached at which a minute and scarcely recognisable trace of carbon dioxide appears. After this slow oxidation has continued for some time with a gradual increase of temperature of 20° – 30° , a sudden and intense reaction occurs. A variation in the proportion of inflammable gas and air does not seem to affect the oxidation temperature.

Shortly before the completion of these investigations, a paper on the "Fractional Combustion of Gases containing Hydrogen by means of Heated Palladium Wire" was published by F. Richardt (J. f. Gasbeleucht., 47, 566–570 and 590–595, abstract in *Gas Lighting Journal*, July, 1904, p. 254). The author found that an appreciable amount of oxidation of the methane did not set in till a temperature of 600° was reached, 150° higher than that recorded by Phillips, when palladiumised asbestos was used. The proportion of methane made no difference. Mixtures of methane and hydrogen in the proportion of 2:3 were then tried, and it was found that the presence of hydrogen did not affect the oxidation temperature of the methane. Thus for fractional combustion of hydrogen, the temperature must not exceed 500 – 600° C. He also studied the effect of passing the gas over a heated palladium wire at an increased rate, sufficient time, however, being allowed for heating. At 600° , 1.3 per cent. of methane had originally been burnt, but at the increased rate, this amount was not burnt till 800° was reached. At a lower speed the curves for the oxidation of methane and air, and methane, hydrogen and air were sensibly the same, but at a higher speed they were different. Richardt concludes that palladium wire exerts no catalytic influence on methane below 450° , but between 450° and a red heat sensible quantities are burnt if the contact is sufficiently prolonged. If the gaseous mixture is led over slowly, the combustion of methane is not affected by the presence of hydrogen, but at a higher rate the heat due to the hydrogen causes the natural retardation to disappear. He also condemns the use of palladium asbestos in favour of the wire, which he finds more amenable to control and more reliable.

Scope of Present Enquiry.

a. Temperature of combustion of methane and oxygen when in the proportion of 1 vol. of methane to 2 vols. of oxygen.

b. Influence of a change in the speed at which the gases are passed over the asbestos.

c. Influence of a change in the relative volumes of the gases.

d. Effect on the combustion temperature of methane when varying proportions of hydrogen are present.

e. A brief enquiry into the question as to how far the catalytic influence of the palladium is due to a superficial oxidation.

APPARATUS AND METHOD OF EXPERIMENT.

Preparation of Methane.

In the preliminary experiments, the methane was prepared from sodium acetate and caustic soda, but it was found that it was impossible to avoid the presence of traces of ethylene, a hydrocarbon which burns at a low temperature. Consequently this method was abandoned, and the gas prepared by the method of Parker and Tribe from pure methyl iodide. The apparatus was first well swept out with 12 litres of gas prepared by the previous method, and then by two litres of the gas prepared from methyl iodide. Analyses always gave a purity of 99 per cent.

The oxygen and hydrogen used were prepared electrolytically from pure dilute sulphuric acid, traces of hydrogen being removed from the oxygen by passage over heated palladium asbestos.

The heating bath consisted of a heavy iron vessel containing molten lead and shielded by asbestos walls, the hot gases rising up and circulating round the bath before their escape. The variation of temperature in the course of an experiment was very rarely 3° , often not 0.5° . A platinum resistance thermometer, on the model of Callendar's, was used for recording the temperature of the bath.

The method of experiment consisted in passing the gases through a tube containing palladium asbestos which was immersed in the lead bath. The burette work was carried

out over mercury. After the gases had been sent through the capillary four times each way, the burette was removed to a room, the temperature of which rarely varied 2° in a day, and the volume read after it had become constant. The carbon dioxide was then determined by absorption with potassium hydroxide. The method may be regarded as correct to 0.2 c.c.; consequently an absorption 0.1 c.c. has always been regarded as an experimental error.

The palladiumised asbestos was prepared from palladium foil according to the usual method.

Experimental Results.

a. Temperature of combustion of methane when in the proportion of one volume of methane to two volumes of oxygen.

The gas was generally passed four times each way over the asbestos. The third column denotes the number of minutes the gas took to complete these four passages.

Temp.	No. of Passages.	Minutes	Volume before absorption of CO_2 .	Volume after absorption of CO_2 .	Result.
$^{\circ}\text{C}.$			c.c.	c.c.	
390	4	18	32.7	32.7	No action
405	4	18	42.3	42.3	"

514	4	17	37.6	37.5	"
514	4	16	37.6	37.6	"
514	4	16	35.4	35.5	"
525	4	17	36.4	35.8	0.6 action
525	4	17	34.6	34.5	"
525	4	16	34.6	34.4	0.2 action
535	4	16	32.2	32.2	No action
535	4	15	35.4	34.9	0.5 action
535	4	17	32.0	32.7	0.2 action
535	4	16	32.9	32.9	No action
544	4	15	31.45	31.3	0.15 action
547	4	17	38.4	38.0	0.4 action
547	4	17	37.6	36.7	0.9 action
547	4	17	35.9	35.2	0.7 action
553	3	11	38.5	37.8	0.7 action
558	4	16	33.4	33.0	0.4 action

All the experiments between 490 – 560° are quoted. The temperature of initial oxidation is seen to lie between 514° – 546° .

b. Influence of a change in the speed at which the gases are passed over the asbestos.

That the time of contact is an important factor in the reaction soon became evident, and hence a series of experiments at twice the previous speed, and one at half the previous speed was carried out. The previous speed was about 1 c.c. in $3\frac{1}{2}$ seconds; hence the gas was in contact with the heated asbestos for a period of 2–4 seconds, quite sufficient for complete heating.

1. The proportions were as before, but the rate was doubled, 1 c.c. being sent over in $1\frac{1}{2}$ seconds.

Temp.	No. of Passages.	Minutes.	Volume before absorption of CO_2 .	Volume after absorption of CO_2 .	Result.
$^{\circ}\text{C}.$			c.c.	c.c.	
563	4	8	30.9	30.9	No action
563	4	7 $\frac{1}{2}$	31.7	31.5	0.2 action
572	4	8 $\frac{1}{2}$	35.3	35.3	No action
572	4	8 $\frac{1}{2}$	37.3	37.1	0.2 action
578	4	8	33.2	33.3	No action
578	4	8 $\frac{1}{2}$	35.3	35.0	0.3 action

562	4	16	16.7	16.7	No action
562	4	16½	15.7	15.3	0.4 action
562	4	16½	16.7	16.3	0.4 action

The temperature at which carbon dioxide is formed appears to be the same as in the first series of experiments, between 530—555°.

A distinct rise is to be noted in the temperature of oxidation, through decreasing the time during which the gas is in contact with the asbestos to $1\frac{1}{2}$ seconds. This bears out the work of Richardt who observed a similar retardation.

The rise in temperature of oxidation amounts to 50°, and this can in no way be ascribed to improper heating of the gas.

With regard to the decreased rate, when the time of contact is greater, there appears to be no reduction of temperature. This points to the conclusion that the natural retardation noted by Mallard and Le Chatelier, and by Richardt is in no way overcome by giving the gas greater facilities for combustion.

Unfortunately, the tubes used would not stand a greater heat than 600°, and hence it was impossible to conduct experiments at a higher temperature.

c. Influence of a change in the relative volumes of the gases.

1. One volume of methane: three volumes of oxygen.

Temp.	No. of Passages.	Minutes.	Volume before absorption of CO ₂ .	Volume after absorption of CO ₂ .	Result.

656	4	11	21.8	21.2	0.6 action

2. One volume of methane: one volume of oxygen.

Temp.	No. of Passages.	Minutes.	Volume before absorption of CO ₂ .	Volume after absorption of CO ₂ .	Result.
°C.			c.c.	c.c.	
545	4	10½	21.2	21.3	No action
545	4	10½	22.9	22.9	"
555	4	11½	23.4	23.4	"
565	4	11	22.8	22.6	0.2 action
565	4	11	23.9	23.8	No action
573	4	10½	21.8	21.8	"
573	4	10½	20.2	20.0	0.2 action
589	4	11	22.8	22.4	0.4 action
589	4	11	22.4	22.0	0.4 action
618	4	10	20.2	19.5	0.7 action
618	4	10	20.2	19.7	0.5 action

The temperature of combustion has in both cases risen considerably; when the ratio of CH₄:O₂ is 1:3 the temperature is about 620°, when the ratio is 1:1, probably about 580°. In both cases the active mixture, consisting of 1 vol. of methane to 2 vols. of oxygen, is diluted to the extent of 33½ per cent., so that it is impossible to affirm that the temperature varies proportionally to the dilution. On plotting a curve for these temperatures, a well-defined minimum is obtained when the ratio is 1 vol. of methane to 2 vols. of oxygen.

d. Effect on the combustion temperature of methane when varying proportions of hydrogen are present; sufficient oxygen being present for complete combustion.

581	4	10	11.0	10.8	0.2 action
599	4	10	12.3	12.1	0.2 action

Temperature of combustion 570°—580°.

The temperature of combustion of methane and oxygen is 514° — 546° ; on addition of 25 per cent. of hydrogen it is 510° — 530° ; on addition of 50 per cent. of hydrogen it is 530° — 550° ; on addition of 100 per cent. of hydrogen it is 545° — 560° ; on addition of 200 per cent. of hydrogen it is 570° — 580° . There is thus undoubted evidence that the addition of hydrogen in no way leads to a lowering of the temperature of oxidation of the methane. When 8 c.c. of hydrogen, 4 c.c. of methane, and 12 c.c. of oxygen are used, we have really 12 c.c. of a gaseous mixture which burns at 50° with the production of intense heat, intimately mixed with 12 c.c. of a gaseous mixture burning at a much higher temperature. It appeared reasonable to suppose that this would lead to a reduction of the temperature of combustion of the methane, and that the intense heat generated by the burning of the hydrogen would aid the action of the catalyser. But this is in no way the case, rather the reverse. Thus we have the phenomenon of an agent catalytically causing a combination at a certain temperature, and when another gas, to which the agent is catalytically more active, is passed over with the mixture, the heat generated by the secondary reaction does not aid the catalytic action of the agent towards the primary mixture. This appears to point to the conclusion that the palladium cannot act catalytically in the oxidation of the hydrogen and of the methane at the same time, but rather appears to confine its energy as a catalyser to the direction in which it is greater.

c. Enquiry as to how far the catalytic influence of the palladium is due to a superficial oxidation.

The catalytic behaviour of the palladium towards certain gases is of great interest, and an attempt was therefore made to find out to what extent the action is due to a superficial oxidation of the metal.

The procedure adopted was to sweep out the apparatus rapidly with oxygen, and then to pass oxygen slowly through. The oxygen left in the capillary was swept out by passing nitrogen through. Methane was then sent over the asbestos as usual.

Temp.	No. of Passages.	Minutes.	Volume before absorption of CO_2 .	Volume after absorption of CO_2 .	Result.
$^{\circ}\text{C}$.			c.c.	c.c.	
550	4	12	11.8	11.9	No action
550	4	11½	12.4	12.4	"
600	4	11	18.2	18.2	"
600	4	14	16.2	16.2	"

It was anticipated that if an oxidation had taken place, sufficient oxygen would be retained to give traces of carbon dioxide. In no case was any of this gas found. So far as this method allows us to judge, the catalytic action is not due to a superficial oxidation of the palladium.

CONCLUSIONS.

1. The temperature of combustion of practically pure methane and oxygen lies between 514° — 546° , a much higher temperature than that recorded by Hempel and Phillips, but in fair agreement with the statements of Winkler and Richardt.
2. An increase in the speed at which the gases are passed through the tube appears to cause a decided increase in the temperature of combustion.
3. A variation in the volumes of the gases exercises an influence on the temperature, tending to raise it above that recorded for a gaseous mixture in proper volumes for complete combustion.
4. The addition of hydrogen even in large quantities does not cause the methane to burn at a lower temperature, and hence the usual method of fractional combustion of hydrogen should give reliable results, if the temperature does not rise above 500° — 550° .
5. The catalytic action of the metal does not appear to be due to a superficial oxidation.
6. Carefully prepared palladiumised asbestos gives consistent results in such combustion.
7. In no case has anything approaching complete com-

bustion been observed, although the gas was at times 100° above its temperature of combustion. This is directly contrary to the statement of Phillips, but in good accord with Richardt's work. The latter found 1.3 per cent. of methane burnt at 600° , whilst in a course of these experiments at from 580° — 595° , about 1 per cent. was found to have been burnt.

Manchester Section.

Meeting held at Manchester, on Friday, November 3rd, 1905.

CHAIRMAN'S ADDRESS.

HIGHER EDUCATION AND CHEMICAL INDUSTRY.

A PLEA FOR CO-OPERATION.

BY DR. G. H. BAILEY.

We, in this country, have too little respect for education, we do not regard it as essential to success in business, or necessary for the progress of our industries. This is not to be wondered at, for, during many years, what has passed muster for education, has, in a very large measure ignored those faculties which are essential to success in the affairs of life and mainly succeeded in reducing the normally healthy-minded pupil to the condition of a second-rate automaton. Whether under the Education Act of 1902, intended as it clearly is, to be a decentralising agency, the educator will get the opportunity he must so long have desired, remains to be seen. This, however, can only come about, if Education Committees will form such a conception of their duties as will prevent those well-meaning persons, the organisers of detail and the ubiquitous official, from dominating the situation. Meanwhile public interest has been aroused. Commissions of inquiry have travelled to and fro, the educational agencies at work in different countries have been reviewed, and it is, at all events, being now more generally appreciated, that the conditions which are to be satisfied in this country, in many respects, differ from those obtaining in other countries. It is also being recognised that the wholesale adoption by us of methods of education which prevail in France or Germany, or even in the United States, would be little short of a national disaster. It is, however not my intention to speak of education in general, nor would it be appropriate that I should occupy the time of the members of a Society of Chemical Industry in such a manner. Still, the fact must not be overlooked, that dullness and want of stimulus in the teaching of primary and secondary schools must seriously affect the progress of higher education. What I propose to do, is to ask your consideration in regard to higher education, of some points which are, in my opinion, of supreme importance to the Chemical Industries. The Society of Chemical Industry has on various occasions discussed the need for skilled assistants, intelligent foremen and reliable workmen, and I think it will now be generally acknowledged that the chief interest for us centres itself, as a matter of urgency, in the skilled assistant. At all events, beyond what general education will do for him, we are prepared to accept the conclusion that the workman may be eliminated from discussion. But when it comes to question of finding a young chemist, whose qualifications present anything like a sure prospect of success in directing the operations of a chemical works, the task is one which cannot be undertaken with any degree of confidence. Not only is this the case, but under existing conditions I cannot see that the situation is at all likely to improve. This is due, I believe, to the absence of a clear conception of the qualifications and abilities which are called for in such an occupation. If any improvement is to take place in

the supply of suitable men, the first step is indeed to realise what is the form of knowledge and the type of ability that is to be looked for. The next step is to examine how far the educational agencies in operation are providing the requisite training, or what modifications or additions should be made in their curricula if the demands for such knowledge are to be met. This is essentially the nature of the inquiry to which I desire to ask your attention. The general problem of the intelligence department in relation to a manufacturing industry may, however, be simplified by a preliminary examination of the duties which fall to the technical chemist; for the services, which are included under his direction in the works, are essentially two-fold in character. There is the analytical work of testing raw materials and products, work which calls for accuracy in manipulation and often for the exercise of considerable judgment. There is further the direction of the operations in the works, demanding knowledge and qualifications which must be placed on an altogether different horizon. In small concerns, the same chemist may have to be responsible for both these classes of work, and also in branches where well defined and long-established operations, of a simple character, form the basis of manufacture, the accuracy and expedition with which routine work is performed will be the predominant factor. It may be maintained, and I think with justice, that the curriculum in practical analysis at our places of higher instruction is not entirely satisfactory even as a preparation for the routine work of analysis. Yet the requisite efficiency might be secured by a moderate revision of the methods of teaching at present employed. I propose, therefore, to devote my attention chiefly to the higher qualifications of the Works Chemist, and in doing so, it must be understood that it is not because I underrate the importance of routine work, nor the vital necessity of such work in deciding the question of success or failure in many departments of chemical industry. I feel, however, that the part played by chemical technology, in its broadest sense, is not only of very much greater import, but is also very inadequately provided for in our present schemes of instruction. The pressing need for highly qualified chemists will appear, if the position of chemical industry is considered from a national point of view, and it is asked how far the permanence of that industry is secured; it must then be seen that security of tenure depends not merely, and not essentially, on routine processes, but on progress in the methods of production. It comes, indeed, to this, that the maintenance of our chemical industry, depends on the chemist who is able to modify existing processes so as to improve their efficiency, who is keen to determine the point at which old processes must be abandoned, old plant set aside, and who has the energy and the knowledge that will enable him to replace them by new processes and new products according to the varying demands of the time.

Progress in manufacture must, indeed, be regarded as a safeguard to stability, far more potent than any political or economic device for the protection of interests, and that nation must succeed in industry, which keeps this clearly in view and possesses the talent wherewith to meet the ever-changing demands made upon it. How many instances could be recalled of branches of industry which have lost ground in this country, or even succumbed, because this condition of success has not been realised? If, however, we are to appeal to the educational institutions for special assistance in the supply of such men, it may be asserted that the number of chemists required for work of the higher type is small, and must of necessity remain so, and that it could hardly be expected that the teaching institutions would offer special facilities for their training. Such an assertion would not be confirmed by the members of this Society, or by those who are familiar with the requirements of industry, nor, as we shall presently see, does it find any support from the experience of other countries. In a field so promising and so full of interest, it may be, indeed, considered strange that there should continue to be the great difficulty that there is, in obtaining men of the requisite talent and that the educational authorities should not long ago have taken independent action in the matter. The chief reasons for this hesitancy proceed, I believe, on the one hand from the inability of

the teaching institutions to realise the urgency of the demand for able men, and, on the other hand, from the failure on the part of the employer to indicate his wants with sufficient clearness or to offer sufficient inducements for their satisfactory fulfilment. The following statement by Mr. W. P. Groser, extracted from the Report of the Mosely Commission, if somewhat severe, is yet an expression of opinion that it is worthy of consideration: "In England, the man of commerce does not love the 'Varsity man. No, he owns that such have the right to try and prove that they have not succumbed to their education and are little the worse for it. Naturally he cannot afford to encourage their vagaries, but, now and again, personal reasons induce him to employ them, and he will be pleased as well as astounded, if they prove competent."

As matters stand, the chemical technologist has to pick up his knowledge of manufacturing operations after he becomes attached to the works. He knows usually little or nothing of these operations even in a general way, and what is worse, his acquaintance with science and mathematics is devoid of any idea of their application to engineering or other problems which are met with in even the most ordinary operations of a chemical works. He is, therefore, incapable of handling a practical problem in which chemical plant is concerned. He has devoted no attention to economic conditions, and would be unable to form even an approximate idea as to the practicability or cost of a chemical operation on the manufacturing scale. His progress is thus hampered, and the services he can render, unless he happens to be a man of unbounded energy, are of necessity restricted to routine work. If he is retained, the opportunity of advancing his knowledge of industrial problems becomes very remote, and, as a consequence, he will probably ultimately settle down to analytical routine. Naturally, the manufacturer finds that, for smaller works at any rate, the man who has grown up in the works, notwithstanding his lack of training in principles, is the better investment. And under the circumstances, who shall blame him for coming to such a conclusion? But it must be manifest that the interests of the chemical industries would be better served by the employment of men of ability who had already made some acquaintance with the principles of chemical technology. Yet, so far as I know, there is no educational institution in this country in which an adequate training in the general principles of technology is given. In addition, however, to a general acquaintance with chemical operations on the manufacturing scale, it is essential that the chemical technologist should possess experience in research. Now a few of our colleges do display considerable activity in research on pure science, but investigation on matters of technical interest and on technical lines is rarely undertaken. Nor is it realised that research on technical subjects is either desirable, or that it is a much more exacting task than that which ordinarily commands the attention of the student. There is no need for me to digress here in order to impress the fact on the members of this Society, for it is well-known to you that the investigation of a technical problem calls not only for sound preliminary knowledge, but also for abilities of the highest order, both in consideration of the limitations imposed, and the stringency of the conditions to be complied with. Yet the idea abroad is a very persistent one, that the second or third rate student, who gives no promise as a teacher, is the type of man to be turned over to the works, and little encouragement is given to the chemical student of high abilities to take up a definite course of preparation for industrial employment. Precisely the reverse of this order of things ought to be insisted upon.

An appropriate training for employment in the chemical industries should be afforded by a good degree course in chemistry, with facilities for obtaining special knowledge of technical matters, and for engaging in research preferably on a subject of technical interest. A period should also be spent in visiting other countries and acquiring a knowledge of the industrial and economic conditions obtaining there. Such an education might be completed in from five to six years, which is no longer than is now found to be necessary in medicine. Indeed, if we include

the further period of practice which the medical man requires before he can be regarded as fully qualified for his profession, the medical course is longer than that suggested for preparation for chemical industry. The college-trained man in the United States also spends much longer in his preparation; in the best colleges he takes an ordinary degree before proceeding to the special work more closely associated with industry.

Before we consider the means whereby the necessary instruction may be imparted, I should like to make some reference to the experience of other countries in regard to professional studies.

In the United States there are nearly 500 colleges and high schools with 155,000 students over 18 years of age. It is evident also that there, at all events, the university graduate is received by the employer with every confidence. He rises rapidly to positions of the highest eminence in works, the demand for him far exceeds the supply (large as this is), and there is an eagerness to secure the graduates of the best colleges which has no parallel in this country. We have records of large concerns employing almost wholly graduates and college-trained men, and of others who are so satisfied with the university men that they will take no other for responsible posts. We have also, in regard to such colleges as Cornell, the Johns Hopkins and the Massachusetts Institute, the remarkable statement, that, for many years past, 60 to 80 per cent. of their graduates have passed into works and occupy high positions therein. So great indeed is the desire to obtain the services of university graduates, that employers lodge their applications for them in advance, an instance being recorded where 160 such applications were booked for 35 graduates about to complete their course. Such figures are in strange contrast to anything that could be produced in this country. In our own university, situated as it is in the heart of the chemical industries, it appears from the Vice-Chancellor's Report that the number of appointments to posts in chemical works last year did not reach double figures, though some 160 appointments to professional and teaching posts are recorded. In Germany, a university training is a necessary preliminary to employment in all positions of responsibility under the State, and in the industries, in addition to this, it is well-known that whole battalions of graduates are engaged by the larger chemical firms in conducting special research. That the universities and colleges of this country attract men of the highest ability cannot be denied, but they have failed to command the confidence of the industries to an extent at all approaching that stated, and I fear they will fail to do so until they come more into touch with industry. In the United States, it has been fully realised that practice and theory must go hand in hand, and the professor who has had experience of manufacturing operations, and who keeps up his works practice, is regarded as the best guide for the student. Facilities are given which enable him to keep up his acquaintance with technical processes, and it is recognised that his services under such circumstances are of greater value to the university or college to which he is attached. Beyond the salutary effect which such associations have upon his teaching, his pupils are given the opportunity, not merely of visiting works, but even of engaging in operations going on there, for such periods that they gain a real insight into practical matters. The necessity of an intimate association of teaching with actual practice has been largely recognised in engineering, and universally in medicine, and its collateral branches, but in chemical industry, which is more complex than either of these, it is almost wanting. It is true that in some branches of chemical industry, endeavours are being made to give the student in training as nearly as possible the experience of appliances which he may be likely to find of service when he is brought under similar environments in the works. I refer to the establishment of plant on a working scale in the teaching institutions as well illustrated in the Manchester School of Technology, the Universities at Leeds and at Sheffield, and some other centres. How far such a method of providing for the need is the best that could be devised is open to question. At any rate, in the United States there is a definite form of co-operation and concerted action between

the industry and the higher teaching institutions, also we know that in Germany and countries where university education is more widely diffused than here, not only does the university professor frequently associate himself with technical inquiry, but relief is sought also in the employment of specialists. With this knowledge before us, let us now consider how the education of the chemical technologist may be secured, with due consideration of the conditions and state of education in this country. In the course of the remarks which I have already made, and those which I am about to make, it may be thought that I am giving a greater prominence to the claims of the university graduate than seems justified by his qualifications, for a high university degree in chemistry in itself affords no guarantee of fitness to occupy a post of responsibility in a chemical works. But I am convinced that it is in institutions of university rank, in this country, as it has been found to be elsewhere, that men of ability must be looked for, and that a liberal education is the surest foundation for ultimate success in industry. If success is to be achieved, however, a very different curriculum must be followed, and I am strongly of opinion that a satisfactory curriculum can only be assured by a more intimate association of the teaching authorities, whoever they may be, and the leaders of industry. That the supplementary training which is requisite depends largely upon the co-operation of the industry will appear from the succeeding paragraphs, in which the nature of the instruction is dealt with.

I. In the first place the course of laboratory teaching in chemistry at present too largely in vogue should be revised and extended, so that it may provide for the needs of industrial chemists. Opportunity should be given to practise the methods of examining fuel and the gases, water for manufacturing purposes, raw materials and finished products. Simple experiments dealing with materials in bulk should also be made, and these should involve considerations bearing upon costs, yields, and methods of handling such as would arise on the large scale. A more practical acquaintance with electrolytic processes and the measurements associated with these processes is an important adjunct.

II. Secondly, the course of training should include a general acquaintance with chemical operations on the manufacturing scale and the plant in which such operations are carried out. Problems relating to furnace operations, to the solution of solids and gases, to crystallisation, distillation, condensation and the like, are met with in almost every manufacturing process, and should be considered by the student under the aspect which they present on the manufacturing scale. Courses of this character were given at the Owens College during the sessions 1888 to 1890. I can testify to the great interest shown by the students who attended, and it is to be regretted that the instruction was not continued.

The following copy of the syllabus will serve to indicate that the subjects dealt with in these courses are of general application. It is added here in order to show in somewhat greater detail the nature of the instruction embraced under this section:—

1. Conditions of combustion; fuels; testing of fuels.
2. Forms of heating appliances; regenerative furnaces; air supply and regulation; examination of chimney gases; regulation and measurement of temperature; pyrometers.
3. Physical properties of water and steam; testing of water for manufacturing purposes; boiler incrustation; types of steam boilers.
4. Physical properties of matter in the gaseous, liquid and solid condition; materials used in the construction of plant; transference of materials and products; pumps and elevators; appliances for grinding and mixing.
5. Chemical operations of the laboratory compared with those of the works; calcination, oxidation, and reduction in the furnace; electrometallurgy; oxidation and reduction by wet processes; bleaching.
6. Solution of gases and solids; lixiviation; digestion under pressure; testing of liquors; treatment of waste liquors.
7. Concentration and evaporation; desiccation; crystallisation; distillation and sublimation; con-

densation of gases and vapours—cooling and refrigeration.

8. The arrangement and laying down of plant; calculation of cost of production.

III. Under the third section I place research, such as would usually occupy the student after his graduation. The question that immediately arises is in regard to the nature of the research which should be undertaken. Provided there is a sound knowledge of the operations and conditions attaching to technical chemistry, such as should be afforded by the course of study already referred to, I do not consider it absolutely essential that the research shall be on a subject of technical interest. Research on pure science, if it is substantial, and if it calls upon the resourcefulness of the worker in opening up new ground and the faculty of accurate deduction and generalisation, will afford an excellent preparation. But the investigation of some question of technical importance, carried out with a view to its bearing on chemical industry, is in no sense inferior to this, and in many respects much more instructive. Moreover, it must be recognised that a very large proportion of the output of research in pure science, from laboratories in this and other countries, is of such a character as to afford no criterion of ability to conduct technical operations. The services which the methods of pure science can render is, perhaps, most pronounced in the colour industry, and yet this industry exemplifies in its most important product, indigo, how great is the necessity for a closer association of pure and applied science. From the point of view of pure science, the original synthesis of this body by Prof. Baeyer was entirely satisfactory, but it was not till after investigations extending over a quarter of a century that the method of producing indigo was placed on a basis which secured its application as a commercial product. Similar experiences will be found if we follow the steps taken in the utilisation of atmospheric oxygen, from the discovery of Boussingault to its ultimate achievement in the Brin process, or we might quote the realisation of the contact process for sulphuric acid, the ammonia-soda process and many others. It is interesting to note also that the researches which have been necessary for the fulfilment of commercial requirements, have greatly enriched chemical science; yet they could never have come under the purview of the student of pure science. Then, if we turn to the more physical aspect of research, we have again evidence of the vital importance of the attention being directed towards the study of physical phenomena in relation to operations on the large scale. The contributions of the late Dr. Hurter on the absorption and condensation of gases, and on the dynamic theory of the formation of sulphuric acid, afford admirable illustrations of this form of inquiry. The extent to which the course of chemical reaction may be modified under the influence of mass and temperature, or by the active movement of gases, or in association with liquid vesicles can nowhere be studied to greater advantage than in a chemical works. Then, again, every chemist who is accustomed to handle reagents by the ton is able to point to phenomena which pass unobserved in the chemical laboratory; also those branches of chemical industry which, like tanning, dyeing and papermaking, depend on the association of chemical substances with organised fibres, afford problems which would exercise the ability of the most skilful investigator. Less ambitious, but equally necessary to industry, is the general investigation of standard methods of analysis and of systems of sampling. These considerations will, I hope, serve to illustrate the interdependence of science and industry from the chemist's point of view, and the importance of greater attention being given to those aspects of chemical technology which alone can cope with the stagnation to which industry is liable. That there are limits to mutual co-operation is manifest, for it is evident that there are problems and details in manufacture which must be safeguarded, but these are of a nature which it is equally clear no teaching institution either should or could concern itself with. Some branches of industry are more affected in this respect than others, but even in those where such a form of protection seems most necessary I am of opinion that there would still be ample opportunity

for participating in such measures as are proposed. The greatest obstacles to be overcome are those which arise from prejudice and the arch-enemy to all progress, inertia, for manifestly, both in their initiation and in subsequent operation, any steps taken must be purely voluntary. Yet we may, I think, rest assured that if industry is to hold its own in this country, the closer association of science and technology must be accomplished. I have dealt with the necessity for co-operation on general principles, and the manifold avenues which will be opened up by the intercourse of specialists in science with specialists in industry must be apparent. But however desirable such a form of co-operation may appear in principle, it may be safely predicted that the magnitude of the advantages which must accrue will be still more fully realised when it comes to be put into practical operation.

Newcastle Section.

*Meeting held at Armstrong College, on Thursday,
November 9th, 1905.*

PROF. HENRY LOUIS IN THE CHAIR.

CHAIRMAN'S ADDRESS.

THE DRESSING OF MINERALS.

BY HENRY LOUIS.

My first duty to-night is to express to you my sincere thanks for the honour you have done me in electing me to the Chairmanship of the Newcastle Branch of the Society of Chemical Industry, and to assure you that no efforts shall be wanting on my part to maintain to the full our ancient prestige during my tenure of the office to which you have appointed me. I am the more sensible of the honour you have conferred upon me, because the particular department of chemical technology with which I am most closely in touch is one that has received comparatively little—I might say even less than its due share of recognition in this Society. I am, of course, aware that the comparatively small attention devoted by this Society to the metallurgical industries may, in no small part, be fairly ascribed to the fact that these industries are already adequately represented by societies dealing especially with this branch of technology. At the same time I think that there is another and deeper-lying cause, which may be briefly expressed by saying that it is only comparatively recently that metallurgy has taken rank amongst the chemical industries. Although the science of chemistry necessarily underlies every portion of metallurgical practice, it is only within the last half century or so that the metallurgist has become aware of the fact. The origin of chemical science must, no doubt, be sought for to a great extent in mediæval experiments upon metals, but the alchemist of the middle ages had little in common with the metallurgical craftsman, who generally not only smelted the ore, but usually also collected or mined it himself. I may remind you that even etymologically the primitive metallurgist was a miner, the Greek "Metallon" meaning both a mine or shaft, and that which was extracted from it, namely, ore or metal. The early metallurgist was thus a rough prospector who extracted the metal from the ore he won by some simple smelting process, and the art of producing metals seems to have developed steadily along these same lines. Thus the well-known treatises of Agricola and Ercker, written for miners in the late middle ages, contain quite as much metallurgical as mining lore; even in the middle of the 18th century, we find the Swedish workman engaged alternately in extracting iron ore and in smelting it as occasion required, and the same is still true to-day of the Chinese tin-miner in the Far East. Metallurgy was thus in its origin a

purely empirical craft, and such it remained to a great extent up to very recent times. Thus even in so highly organised a manufacture as that of steel-making, we find that when the old-fashioned Sheffield steel melter found his metal teeming "too lively," he would physic it by throwing a bit of "glazed pig" into the pot, which experience had taught him would effect the desired object, although he had not the faintest idea that such pig-iron was rich in silicon, and was at least equally ignorant of the action of silicon upon molten steel.

Contrast now this state of affairs with the inception and development of the chemical industry, meaning by this phrase the "heavy" chemical trade, the manufacture of such articles as sulphuric acid, soda, &c. This trade never was a craft, it was never empiric at all; it grew from a purely scientific origin under the care of scientific chemists, and has been the development, along scientific lines, of the application of such chemicals as those mentioned to the everyday arts and industries. The contrast between the origin and the growth of the metallurgical crafts and the chemical industries is as sharp and as complete as possible, and yet it would be difficult to point out two industries in which the methods and appliances employed more closely resemble each other. In proportion as the refinements of chemical science have been applied to metallurgy on the one hand, and as the manufacture of chemicals on the other hand has become more of an ordinary industrial operation, so have the two arts approached each other, until it is difficult to draw any dividing line between them. The production of aluminium, of magnesium, and perhaps even more of sodium is, for example, looked upon as a purely chemical industry, although the product is a metal; the extraction of these metals from their ores is not, as a rule, included in metallurgical text-books, and most metallurgists would look upon it as outside their particular province; on the other hand, again, the extraction of gold, probably one of the most ancient of metallurgical operations, and until recently one of crudest conducted on purely empirical lines, has largely been carried on in recent times by the help of methods and appliances—such as leaching tanks and filter-presses—which may be looked upon as lying well within the especial domain of the manufacturing chemist.

In addition to the close alliance in methods and appliances now existing between these two arts which originated so far asunder, there is another most important point common to metallurgy and chemical manufacture, namely, that both utilise identically the same class of raw materials. Of all the raw materials available for the service of man, those of the organic world are procured by the agriculturist and the hunter—using these words in their widest sense, whilst those of the inorganic world are contributed by the miner. It is to these latter that the attention of the metallurgist and of the chemical manufacturer are in the main directed; both still use some organic products, but their place is being more and more occupied by mineral substances. Practically we look to the miner to-day to furnish us with all the raw materials which the metallurgist and the chemical manufacturer have to transform into products which can be utilised in our arts and manufactures.

I should like, therefore, to consider with you to-night the relation of the arts of metallurgy and chemical industry to the elaboration of the raw material produced by the miner in one particular aspect. Between the operations of mining, properly speaking, and those pertaining to the above-named industries, we find another group of somewhat nondescript operations, which belong to the province neither of the producer nor of the utiliser, but occupy ground common to both, and employ principles with which both are familiar. It is very rare, indeed, that mineral as mined happens to be in a condition suitable for the purposes of those who have to work it up: it usually has to undergo some process of preparation, some form of cleaning, in order to fit it for use, and it is to such preparatory processes as these that I desire to direct your attention. These are usually spoken of under the comprehensive but vague term of "dressing," which includes under one designation, a very large number of operations of very varying degrees of complexity according to circumstances. Thus, for

example, all that a coal may need may be merely picking out by hand the pieces of shale or dirt that may have become mixed with it in the course of mining; again, many deposits of iron pyrites yield a mineral so clean that it needs merely breaking up into lumps of suitable size, or perhaps sorting into various grades, by its approximate copper contents as judged by the eye. At the opposite end of the scale stands the dressing of such a material as tin ore, which contains as mined only 1 or 2 per cent. of "black tin" or tin oxide, contaminated with such impurities as copper ore, iron and arsenical pyrites, wolfram, &c. As oxide of tin forms fusible compounds with both siliceous and basic substances, tin silicate and a stannate being respectively produced, any form of impurity will cause loss of tin in the slags; the first condition of economic tin smelting is, therefore, to keep the proportion of slag formed down to the lowest possible limits, which can only be done by smelting nothing but rich ores. It is generally recognised that it does not, as a rule, pay to smelt ores containing less than 65 per cent. of metal, and as a rule the percentage is nearer to 70. Furthermore, tin has a great affinity for other metals, forming alloys most of which have a very injurious effect upon the working qualities of the tin, and most of which can only be eliminated with the greatest difficulty from the tin with which they have combined. The dressers' problem is, therefore, to produce a rich, pure ore from the poor and impure crude ore. This concentration and purification are effected by an elaborate series of crushing and washing operations, by which all the lighter earthy portions of the ore are ultimately removed, leaving the heavier metallic portions in a concentrated form; the latter may still contain such injurious impurities as arsenical pyrites and wolfram. The former can be got rid of by calcining the ore, thus decomposing the arsenical pyrites, driving off the arsenic as arsenious acid, and leaving behind oxide of iron in a light, spongy form, in which it is easily washed away from the tinstone. Wolfram can be got rid of by Oxland's process, which consists in fusing the ore with black ash, thus forming soluble tungstate of soda, which can be dissolved out, again leaving a light oxide of iron, which can be removed by washing. Here, then, we have an elaborate series of crushings, washings, calcinations and fusions, the sole object of which is to provide the metallurgist with an ore sufficiently rich and pure to admit of profitable smelting.

Between these two extremes, operations and groups of operations of all degrees of complexity are to be met with, the object being the preparation of the minerals in such a state of purity as will best fit them for the subsequent treatment that they will have to undergo at the hands of the smelter or the manufacturer—in other words, to render them marketable.

Sometimes the object is simple concentration or enriching, as when the earthy impurities are removed from a poor lead ore in order to get a rich galena suitable for smelting. Sometimes the object is the removal of injurious constituents, as, for instance, when shale or pyrites are separated from the coal with which they are intermixed, or when apatite is eliminated from an iron ore in order to obtain a Bessemer or practically non-phosphoric ore. It may happen, as in the latter case, that the injurious impurity got rid of may in its turn be converted into a marketable article, so that the production of commercially valuable bye-products may also have to be kept in view. Finally, we have the interesting case that sometimes presents itself, where a mixture of two valuable minerals may be practically worthless until the individual minerals have been separated. One of the best examples of this is to be found in those intimate mixtures of zinc blende and galena, that are met with in many mining districts, but notably in New South Wales. Such a mixture cannot be smelted direct: the readily fusible galena prevents the complete calcination of the blende, and even if satisfactory calcination were possible the refractory vessels needed for the distillation of the zinc would be rapidly destroyed by the lead silicate produced on heating. On the other hand, the excessively refractory zinc compounds prevent the lead from being smelted by any of the methods known to lead smelters.

The mixed ore is thus equally worthless to the zinc smelter and to the lead smelter; yet if the blende and the galena can be separated, both are readily marketable.

It is an obvious truism that the processes to be adopted in each particular case must depend upon the differences in the properties of the minerals that it is desired to separate; accordingly we find that these processes are mechanical, physical or chemical. For a period covering many centuries only mechanical means were employed, all the others having sprung up within the last half century and many within the last decade. The most striking characteristic of many valuable minerals, notably of metallic minerals, is their relatively high specific gravity. This appears to have been the property that first attracted the notice of primitive man, and which probably led to the recognition of ores of the metals in the first instance. It is, therefore, only natural that the earliest methods of dressing minerals for the purpose of obtaining such ores in a concentrated form should have been based upon their superior density and it is impossible to say at how early a date the simple method originated of washing an aggregate of mineral particles in a stream of water which would carry off the lighter particles and leave the heavier. The very earliest treatises on mining already show different and comparatively elaborate forms of appliances making use of this principle: in its simpler type it is still found amongst semi-civilised races all over the earth under forms which, although very similar, are evidently the result of independent invention. These ancient devices have continued in use down to the present day, and their design was purely empirical until comparatively recent times. The first systematic investigation of the underlying principles was due to Bergrath Peter von Rittinger, whose classical treatise, published in 1867, defined the laws governing the motion of particles of mineral in water, and the effect upon them of water currents. Rittinger did not merely develop the theory of the subject; he also invented and improved numerous appliances for the effective separation of minerals of different specific gravity, and appears to have been the first to appreciate the economic importance of making the operation continuous, and of discharging the concentrates and the tailings automatically; the replacement of intermittent hand-worked appliances by continuous self-acting ones was the first real step in the evolution of modern dressing machinery.

Obviously, before it is possible to separate the individual minerals composing a massive aggregate, it is indispensable to break down the mass into fragments of such size as to release the individual minerals, and crushing machinery, therefore, plays a very important part amongst dressing appliances. Such machinery dates back to very ancient times; of the three principles upon which it may act, namely, by percussion, by attrition, or by pressure, the very earliest machines seem to have used the first named, and then came those depending upon attrition. Rolls, which act mainly by pressure, seem to have been devised first in Cornwall about the year 1800, and the well-known Blake rockbreaker was invented by E. W. Blake, at New Haven, U.S.A., in the year 1858. Although many new machines have been devised since then, the principal modern improvements have been in the direction of better engineering design, and the use of superior materials of construction.

Amongst the great advances due to Rittinger was the recognition of the importance of sizing, and the demonstration of the fact that it is much easier to effect a separation amongst mineral particles of different density when they are all of approximately the same size; his theory also indicated the degree of accuracy to which sizing should be carried. This is now looked upon as one of the fundamental principles of modern dressing, and the grading of the crushed mineral according to the size of the particles is a portion of the work of every dressing plant; it is performed by means of a large variety of screening and classifying appliances, none of which need any special reference here.

In every system of comminution, it is impossible to prevent a certain portion of the material from being

crushed much finer than is absolutely required; such very fine particles, which, when suspended in water, as is usually the case, are known as slimes, have always been the great difficulty in every system of dressing minerals. Here, again, Rittinger did much useful pioneer work: he showed that slimes could not be successfully treated in appliances in which water currents alone were employed, but that external impulses must be superadded, and he designed or improved what may generically be spoken of as shaking tables, that is to say, inclined surfaces over which the pulp of slimes is allowed to flow in a gentle stream whilst the surface is subjected to a series of shakes, jerks, or impulses, which promote the separation of the specifically heavier from the lighter materials. Modern invention has been busy chiefly with appliances for treating these finer portions of the crushed mineral, those for treating the coarser particles being already tolerably effective.

Most of the appliances now used for the dressing of the coarser fragments depend upon the action either of continuous upward currents of water, or upon the action of alternate upward and downward currents of short duration. No better example of the former can be quoted than the well-known syphon washer (Heberwäsche) used at the lead mines of Mechernich, near Commern, Rhenish Prussia. The ore to be treated consists of a very soft sandstone with small concretionary nodules of galena, which needs very little crushing. The crushed stuff is carried by a stream of water along a trough G (Fig. I.) to a vertical chamber B, up which a current of water rises that carries the lighter sandstone particles up and away through a continuation of the trough, whilst the heavier galena settles down to the bottom. The bottom of the chamber consists of a perforated plate, upon which the galena drops, the perforations being small enough not to let the ore drop through, whilst allowing the water to flow upwards. In the middle of this perforated funnel-shaped bottom there is an escape pipe, which is normally closed by a plug attached to a long rod. This rod is connected to a float S in a tank C, from which the water supply is furnished that ascends through the perforated bottom of B. When a certain amount of washed ore has accumulated on this perforated bottom, it checks the upward flow of the water, thus banking the water back in C, and lifting the float S, which in its turn raises the plug and opens the escape pipe. The ore runs through it into a suitable receiver, thus freeing the water in C, which resumes its previous level, allowing the float S to descend and forcing the plug down again into the escape pipe. The whole operation is thus continuous and automatic.

The other type of appliances, known generically as jigs, may be illustrated by the machines used largely for washing small coal. These (Fig. II.) consist essentially of a box divided into two communicating compartments; in one of these a piston reciprocates, whilst a screen of stout wire gauze is fixed more or less horizontally across the other. A supply of water is admitted into the box, and the dirty small coal is delivered on to the screen at one edge of it, usually in a stream of water; it is thus carried across the screen and in its passage is submitted to a series of upward pulsions and downward suction due to the alternate ascent and descent of water through the screen caused by the downward and upward motion of the piston in the adjoining compartment. Under the influence of these impulses the coal is separated into two layers—the upper of the lighter clean coal, and the lower of the heavier materials, such as stone, shale, pyrites, &c. The former flows over a suitably arranged gate into a receiver. The latter is either discharged at a lower gate, close to the level of the upper surface of the screen, when the pieces washed are larger than the mesh of the screen, or else (Fig. III.) they pass through the screen into the box, whence they are removed by suitable devices. The latter method is usually applied to washing small coal that has passed about a 3/8 in. mesh, the former to the larger sizes. When the latter plan is employed a bed of pieces of felspar, just large enough not to go through the meshes, is placed upon the screen to prevent any small pieces of clean coal being accidentally drawn through; this form of jig is generally spoken of as a felspar washer.

There are many modifications of this type of appliance, and it has a wide range of usefulness.

Of the numerous machines devised for treating the more finely divided minerals and shales I will mention only two, typical of modern practice, namely, the Frue Vanner and the Willley table. The former (Fig. IV.) consists of an endless indiarubber belt, supported on rollers, carried by a frame having a slight slope in the direction of its length. The belt is given a slow movement up the slope, the frame receiving at the same time a rapid transverse vibrating motion. The pulp to be dressed is allowed to flow down the belt, when the heavier material tends to settle upon its surface, whilst the lighter materials flow over it in the stream of water. The heavier particles adhere to the belt, and are thus carried upwards and discharged at the top end, whilst the lighter particles are discharged at the lower end, the separation being assisted by the rapid shaking motion. A very complete separation is thus produced, even when working upon extremely finely-divided material.

The Willley table (Fig. V.), invented about 10 years ago, is a type of the most modern machine for separating finely-crushed mineral. It consists of a nearly rectangular (trapezoidal) table, sloping downwards in the direction of its shorter sides; by means of a peculiarly-arranged toggle mechanism it receives a rapid forward and slow backward movement; the surface of the table is covered with grooves parallel to its longer side, deepest at the motion end, and running out to nothing as they approach the further end. The pulp is fed on to the upper edge close to the motion end; the lighter particles flow down successively into groove after groove, and escape at the lower edge almost opposite the point where the pulp is admitted, whilst the heavier portions, working their way to the bottom of the grooves, flow along these and thus travel parallel to the length of the table for a greater or lesser distance according to their specific gravities, before they are finally discharged. A pulp containing various minerals of different densities can thus be separated into its constituent minerals with great accuracy, this power of making several different grades being one of the most valuable characters of the Willley table.

These examples will suffice to illustrate the methods employed in modern dressing practice, in order to separate minerals of different specific gravities. With the advance of the subject, however, the need of being able to separate at times minerals of practically the same specific gravity often makes itself felt, and at the present day a large range of the other properties of minerals has been pressed into service; prominent amongst these I may mention differences in magnetic permeability, in electric conductivity, in surface attraction for liquids, and in chemical reactions.

It is obvious enough that two minerals of very different magnetic susceptibilities can be readily separated by the magnet; unfortunately the great majority of minerals are very feebly magnetic, the only ones that are at all readily attracted by the magnet being magnetite, magnetic pyrites (pyrrhotite), and some varieties of ilmenite and franklinite. There has not been much work done upon the determination of the magnetic susceptibilities of minerals; some of the most recent is that published by Mr. W. R. Crane,* from which it appears that the pull exerted in attracting certain minerals, expressed in percentages of their weight, is as follows (neglecting decimals):—

Iron, 72,606 (taken as a standard for comparison).
Magnetite, 29,140.
Franklinite, 23,942.
Ilmenite, 18,500.
Pyrrhotite, 1359—4898.
Haematite, 150—424.
Spathic ore, 373—453.
Iron pyrites, 12—113.

The great majority of other minerals being below 100. It appears to me that the tractive power of pyrrhotite here given is too low, and that of franklinite too high,

but these figures illustrate well the great difference between the magnetic susceptibility of the first four minerals on the list and all others.

A few ores of iron can be rendered magnetic by simple treatment; thus spathic ore and non-pyrites can be rendered strongly magnetic by simply heating to a low red heat out of contact with air, and red and brown haematite can be rendered similarly magnetic by heating in a reducing atmosphere. As might be expected the first attempts at magnetic separation were confined to magnetite, and had for their object the production of a rich, pure iron ore from low-grade ores rendered impure by the presence of phosphates or sulphides. As deposits of magnetite occur chiefly in regions where the older crystalline rocks are extensively developed, such as Scandinavia and the North-east portion of North America, it is only natural that the first magnetic separating machines should have originated in Sweden and in the United States. Such machines seem to have been built experimentally as far back as 1870, but it was fully 10 years later before they came into anything like general use. One of the earliest machines to achieve practical success was the Swedish Wenström machine, which is still doing good work, and the construction of which is typical of many others. It consists (Fig. VI.) of a drum built up of alternate narrow segments of iron and some non-magnetic material, which is rotated about an eccentrically-placed electromagnet. The material to be separated is delivered on to the drum and carried round with it; on entering the magnetic field the magnetic portions adhere and are carried further round, whilst the non-magnetic portions at once drop off; the magnetic fragments drop off in their turn as soon as the rotation of the drum has carried them past the magnetic field, and the magnetic and non-magnetic particles are thus effectually separated. Other machines use travelling belts to carry the material to be treated through the magnetic field, whilst Edison simply allows the crushed mineral to fall past the pole of a magnet, the magnetic portion being sufficiently deflected in passing the field to effect a separation. All these machines work upon dry material, and when this is finely ground, it is obvious that perfect dryness is a necessary condition to enable complete separation to be brought about. This fact necessitates artificial drying as a general rule, which not only adds to the expense, but may sometimes interfere with the process, more especially when it is desired to free magnetite from iron pyrites. On drying such an ore it is almost impossible to regulate the temperature so accurately as not to convert a certain portion of the iron pyrites into magnetic pyrites, which is then taken up with the magnetite. To get over this difficulty, as well as that caused by fine, dry dust clinging to the magnetite, wet magnetic concentration has been introduced; in some of the best modern machines of this type, a revolving drum, somewhat like that used in the Wenström machine, picks out the magnetic particles from a pulp of crushed ore suspended in a stream of water flowing past the drum. The Gröndal machine (Fig. VII.), which has been very successful in practice, is of this type. Wet magnetic concentration can be made to give exceedingly good results, it being quite possible to produce in regular work concentrates with 70 per cent. of metallic iron. Dry concentration is usually preferred when a feebly magnetic mineral has been rendered strongly magnetic by heating, as has been done, for instance, in order to separate spathic ore from zinc blende; this separation is impossible by the methods of ordinary dressing, because the two minerals have practically the same specific gravity, but its attainment is important, because any iron ore left in the blende will rapidly destroy the retorts or other vessels used for distilling off the zinc. As a simple heating converts spathic ore into magnetic oxide of iron, magnetic separation affords a simple solution of the problem.

An important advance was made in this branch of the subject by Mr. Wetherill in 1896, when he showed that minerals of low magnetic susceptibility, or what, in ordinary language, would be called non-magnetic minerals, could be separated from minerals still lower in the magnetic scale, provided they were introduced into a sufficiently powerful magnetic field such as is produced between the

* Investigations of Magnetic Fields with reference to Ore-Concentration. By Walter R. Crane. Trans. Amer. Inst. Min. Eng., Vol. XXXI., p. 405.

wedge-shaped pole-pieces of strong electro-magnets. The Wetherill machine (Fig. VIII.) consists of magnets provided with such pole-pieces, to which the crushed ore to be treated is conveyed on belts, other belts carrying away those portions of the ore that are magnetically attracted; the process has been used for many different minerals, and is especially applicable to zinc ores, from which ferrous minerals, like franklinite, sphathic ore, &c., can be removed, no calcination being needed in this case; some black blendes also contain enough iron to enable them to be attracted by the magnet in these machines. The Wetherill machine has also been used successfully for separating wolfram from tin-stone. The Edison machine, for the separation of feebly magnetic minerals, such as specular haematite, from less magnetic ones, operates by allowing the crushed ore to fall past magnets furnished with pole-pieces so shaped as to produce a very powerful field, when the feebly-magnetic minerals are sufficiently deflected to effect a separation.

There is only one process in use depending upon differences in electric conductivity, which is known as the Blake-Morscher process, first brought out in the year 1901. It consists in allowing the finely crushed and perfectly dry ore to fall in a thin stream past a pole charged with high-tension static electricity. Any particles which consist of good conductors of electricity are immediately electrified similarly to the pole, and are hence repelled by it, whilst the direction of fall of bad conductors is unaffected. The machine (Fig. IX.) merely consists of a series of suitable poles arranged below each other, past which the stream of ore flows successively. Graphite and most of the metallic minerals have been found to be good conductors with the exception of compounds of zinc, some forms of blende being especially bad conductors. Practically all the plants now at work are employed for freeing zinc blende from iron pyrites, the economic importance of which separation I have already referred to; the specific gravities of these two minerals are nearly the same, and magnetic separation by the Wetherill process can only be carried out when the blende is high in iron. For cleaning the purer varieties of blende this process has therefore a definite field of usefulness. The method is still so new that it is impossible to predict what its future is likely to be.

The principle of the differential surface attraction of minerals for liquids has been utilised in the Elmore oil process, introduced about the year 1899. It depends upon the following fact:—If a mixture of finely-crushed minerals, some of which are sulphides of the heavy metals, whilst others are such oxides as quartz or alumina, or such silicates as clay, is formed into a pulp with water, and the pulp mixed with a heavy oil, such as petroleum residues, it will be found that the oil will wet and adhere to the metallic sulphides, but will not touch the other minerals; as the oil then floats up to the surface of the pulp, it will carry the metallic minerals up with it, thus separating these from the gangue with which they were intermixed. This process is particularly applicable to copper and silver ores which have to be crushed fine for treatment by the ordinary methods of dressing according to specific gravity; some of the minerals richest in these metals are very brittle, and in the process of crushing yield a powder so fine that it floats on water. To such a powder the ordinary methods of dressing are obviously inapplicable, but it can readily be concentrated by the Elmore process. This is carried out by mixing the pulp of crushed mineral with oil in horizontal revolving iron cylinders (Fig. X.) fitted with an internal spiral; there are three such cylinders placed one below the other from the lowest the mixture flows into a funnel-shaped iron vessel, from the bottom of which the pulp, carrying the non-metallic material, flows off to waste, whilst the oil carrying the metallic particles overflows at the top into a suitable receiver. The oil is separated from the mineral particles in a special form of centrifugal pan with solid walls and a projecting flange round the top. Hot water is first run in until it forms a wall round the pan equal in thickness to the depth of the flange. On now running the charged oil into the centre of the rotating pan, the mineral is driven through the wall of water against the iron wall of the pan, whilst the oil remains inside the water and

flows up over the edge of the flange. By these means the metallic minerals are obtained in a high state of concentration. The process is in use in several places, and is giving satisfactory results, especially in saving very fine particles of rich ores that have escaped collection by any form of ordinary dressing appliances.

Another process, which appears to depend on an application of the same principle, is one used to recover small diamonds from the tailings escaping from the pans in which diamondiferous blue-ground is washed. These tailings are streamed over shaking tables with grooved surfaces, covered with a layer of thick grease. The diamonds adhere to the grease, and are caught, whilst the other minerals flow off freely.

Finally, I may refer to a very novel process, which effects the separation of certain minerals by chemical means, which is generally spoken of as the "flotation" process. This was first devised by C. V. Potter in 1901, and depends upon the fact that when zinc blende in a state of fine division is thrown into hot, very dilute sulphuric acid, sulphuretted hydrogen is formed, which adheres to the blende in the form of a bubble and floats the mineral to the surface.

The Delprat process, patented in 1902, is similar, but uses a hot acid solution of salt-cake. These processes are being applied to the mixed ores of the Broken Hill district, New South Wales, which contain a great deal of zinc blende in a state of such intimate admixture that none of the ordinary methods of dressing can be employed to separate it. The finely-ground ore is fed into a tank containing the above solutions, when the blende rises to the surface and can be skimmed off, the other minerals being drawn off from the bottom of the tank. It has also been proposed to use dilute nitric acid and chlorine water for the same purposes. This principle appears to be susceptible of much further development, and a good deal of attention is now being paid to it. It is interesting to note how we have here chemical methods being employed to solve a problem that was for so many years attempted by purely mechanical means.

I have now, gentlemen, attempted to lay before you a brief review of the more important methods in use to-day for preparing crude mineral products for treatment by the metallurgist or the industrial chemist. I have, of course, only attempted the barest outline of this very large subject, so as to indicate the degree of development to which it has by now attained, and to show how rapidly the old mechanical methods are being reinforced from the domains of physics and chemistry. I have been anxious to impress upon you its importance in the utilisation of the world's mineral wealth, which is all the greater because mineral products, unlike those of the animate kingdom, are incapable of reproduction. A bad harvest in one year may be compensated by a good one in the next, but a mineral deposit, once worked out, is exhausted for ever. It is accordingly the duty of all who have to treat minerals to study with special attention all methods and processes that tend to the more complete utilisation of the world's mineral output. I trust that this consideration may be deemed sufficient excuse for my having occupied your time this evening with a review of a subject somewhat different from those usually submitted to the meetings of this Society, but which I have endeavoured to show nevertheless possesses for all of us a very real importance.

Meeting held at Armstrong College on Thursday, November 9th, 1905.

PROF. HENRY LOUIS IN THE CHAIR.

DETERMINATION OF SULPHUR IN PETROLEUM AND BITUMINOUS MINERALS.

BY F. C. GARRETT, D.S.C., AND E. L. LOMAX, B.S.C.

Many methods for the estimation of sulphur in bituminous minerals have been suggested, but Hodgson

(*J. Amer. Chem. Soc.*, 1898, 20, 882; this J., 1899, 77) has shown that none could be trusted except that of Carius, and this method, though accurate, is very tedious. We have found that, by some modification in the details, the familiar method of heating with a mixture of sodium carbonate and lime or magnesia can be used even in the analysis of petroleum. A convenient quantity (*i.e.*, from 0.7 to 1.5 gm.) of the substance is placed in a small platinum crucible, intimately mixed with 3 or 4 grms. of a mixture of four parts of pure lime to one of anhydrous sodium carbonate, and the crucible completely filled with the lime-soda mixture. A larger platinum crucible is placed over the small one (mouth downward), the whole inverted, and the space between the two crucibles filled with the lime-soda mixture. The mouth of the crucible is covered by a thick pad of asbestos board, and the apparatus placed in a muffle furnace heated to bright redness: the object of the asbestos pad is to protect the inner crucible from radiation from the roof of the muffle, and so to ensure that distillation shall not commence before the mixture in the outer crucible has had time to heat up. Distillation commences in about two minutes, and as soon as a flame appears the asbestos may be removed. To ensure complete oxidation of carbon the roasting should be continued for two hours. The mixture is then brought into water, sulphides, &c., oxidised by bromine, and the solution acidified, filtered, and precipitated by barium chloride as usual. If the amount of sulphur be small it is advisable to allow the solution to stand on the water bath for 24 hours before filtering off the barium sulphate.

The following experiments show that the method is trustworthy:—

(I) 0.2340 gm. of dibenzyl disulphide gave 0.460 gm. BaSO_4 . S=26.18 per cent.

0.1258 gm. gave 0.2386 gm. BaSO_4 . S=26.04 per cent. The formula requires 26.01 per cent.

(II) Trinidad petroleum, by Carius' method:—

0.9270 gm. gave 0.0940 gm. BaSO_4 . S=1.39 per cent.
0.8868 " 0.0910 " S=1.41 "

Five consecutive analyses of the same petroleum by the lime-soda method resulted as follows:—

1.4890 gm. gave 0.1386 gm. BaSO_4 . S=1.28 per cent.
1.4140 " 0.1434 " S=1.39 "
1.2980 " 0.1350 " S=1.42 "
1.4690 " 0.1386 " S=1.29 "
1.3740 " 0.1394 " S=1.39 "

Mean=1.35 "

(III) Examination of a sample of Trinidad Manjak:—

0.7946 gm. gave 0.1720 gm. BaSO_4 . S=2.97 per cent.
0.8666 " 0.1862 " S=2.95 per cent.

(IV) It was suggested that as about 22 grms. of the lime-soda mixture was used, the large amount of calcium and

sodium chlorides in the solution might affect the result. A solution of pure sulphonic acid was therefore prepared of such a strength that 25 c.c. contained 58.8 mgrms. of H_2SO_4 or 18.4 mgrms. of sulphur; 25 c.c. of the solution was added to 20 grms. of the mixture, and worked up as usual, when 0.1428 gm. of BaSO_4 was obtained, corresponding to 60.0 mgrms. H_2SO_4 or 18.8 mgrms. S.

Postscript. Since the foregoing was written, Sadtler (*J. Amer. Chem. Soc.*, 1905, 27, 1188; this J., 1905, 1038) has described a method differing from this only in certain details: he uses a platinum crucible of special design, a mixture of equal quantities of sodium carbonate and magnesia, heats over the blow-pipe, and does not fill the outer crucible. We adopted lime because we found it easier to obtain free from sulphur than magnesia; we also find that if the percentage of sodium carbonate be increased, the mixture cakes, and is difficult to remove from the crucible. The filling of the outer crucible is important, as is shown by an examination of dibenzyl disulphide, made with the outer crucible filled only to the depth of about a quarter of an inch, when

0.1210 gm. gave 0.1436 gm. BaSO_4 . S=16.4 per cent. (Theory requires 26.01 per cent.)

Possibly the use which Sadtler makes of asbestos gives a better absorption in the inner crucible, and so enables him to work with less of the mixture.

Sydney Section.

Meeting held at Sydney on Wednesday, September 13th, 1905.

PROF. LIVESEIDGE, F.R.S., IN THE CHAIR.

ANALYSES OF SOME NEW ZEALAND COALS.

BY A. M. WRIGHT.

The coals of New Zealand are of varying quality, some of them being equal to the best found in other parts of the world, while others are inferior, and of merely local value.

The following analyses were made, in most cases, from consignments of from 40 to 100 tons. The calorific value was determined with Rosenhain's modification of the Thomsen coal calorimeter:—

A.—Anthracite Coals.

	Moisture.	Ash.	Volatile combustible matter.	Fixed Carbon	Sulphur.	Calories.
1. Acheron	1.80	12.12	1.96	84.12	—	—
2. Paparoa	5.11	2.55	15.89	76.45	0.15	7598

1. This analysis is taken from the reports of the Colonial Laboratory.

2. It is claimed for this coal, that it is identical with the best Welsh. It is estimated that about sixty-five million tons of it are available.

B.—Semi-Bituminous and Bituminous Coals.

	Moisture.	Ash.	Volatile combustible matter.	Fixed carbon.	Sulphur.	Calories.
1. Coalbrookdale	1.84	4.82	22.68	70.66	0.49	7508
2. Grey River	2.07	6.44	28.32	63.17	0.64	7233
3. Mokihui	3.65	3.30	36.36	56.69	0.72	7482
4. Brunner	1.58	5.30	35.70	57.42	1.03	7389
5. Puponga	6.78	8.90	33.16	51.16	0.61	6895
6. Westport (good)	2.10	2.27	30.42	65.21	1.24	7698
7. Westport (average)	3.63	2.75	36.39	57.23	1.58	7473
8. Co-operative mine	5.81	1.12	34.72	58.35	1.35	7381
9. State coal mine (Port Elizabeth)	9.88	0.88	35.95	53.29	1.45	7063
10. State coal mine (Port Elizabeth)	10.48	1.63	31.87	56.02	0.97	7003
11. Westport Cardiff	3.33	1.55	38.28	56.84	1.02	7651
12. Blackball	8.25	1.72	27.98	62.05	0.62	7204
13. Kawa-Kawa	3.32	3.62	43.59	49.47	1.22	7328
14. Hikurangi	6.89	2.50	45.06	45.55	0.88	7245

1. A bright hard coal, yielding a strong lustrous coke and grey ash.
2. Almost lustrous, of very compact structure; the coke is highly vesicular, and ash light brown.
3. Bright and compact, yielding a hard coherent coke.
4. Bright and hard, yielding a vesicular coke, and grey ash.
5. Burns slowly without coking. The ash is red, containing much ferric oxide.
6. Bright and hard, burns fiercely, giving a lustrous, highly vesicular coke. Is well known in Australasia and extensively used in New Zealand.
7. Lustrous and hard, burns freely, giving a fairly compact coke and grey ash.
8. Lustrous and compact, burning freely. Yields a compact coke and grey ash.
9. Somewhat friable, lustrous and homogeneous. The coke is highly vesicular and burns to a grey ash.
- 11 and 12. Frequently contain quantities of fossil resin allied closely to the kauri gum.
12. Hard and lustrous, yielding a coke which frita well at high temperatures, burning to a brown ash.

C.—Brown Coals.

	Moisture.	Ash.	Volatile combustible matter.	Fixed carbon.	Sulphur.	Calories.
1. Malvern Hills	25.83	3.96	36.85	33.36	0.68	5388
2. Woolshed Creek	26.80	5.45	29.42	38.33	1.63	5102
3. Kaitangata	15.86	6.44	35.96	41.74	1.07	6100
4. Homebush	15.68	3.30	35.20	45.82	0.95	6215

1. Friable, burns slowly without coking to a bulky grey ash.
2. Fairly compact, burns without coking to a grey ash.
3. Fairly compact, gives a very friable coke and a grey ash, mostly calcium carbonate.

For permission to submit this paper, I have to express my thanks to Mr. Gilbert Anderson, Managing Director of the Christchurch Meat Co., Ltd., in whose laboratory most of the work has been carried out.

DISCUSSION.

Mr. T. U. WALTON said that, except in certain Government reports, very few analyses of New Zealand coals seemed to have been published, and the paper was of value in supplying information as to the different kinds of coal obtainable, an interesting feature in most of which was the small proportion of ash. He had seen many analyses of similar coals, the results of which were in close agreement with those now published, except in respect to sulphur, the determination of which struck him as being generally too low. Thus Hikurangi coal was said to contain 0.88 per cent., while he had seen samples with only $4\frac{1}{2}$ per cent. ash, containing about 5 per cent. sulphur, most of it in the free state, though the usual quantity was about 2½ per cent. Roasting with sodium carbonate was one of the best methods for complete oxidation of the sulphur, and he would like to know what method the author had used.

Mr. T. STEEL said that in the "Transactions of the New Zealand Institute," 31, 34, Evans gave a number of analyses of these coals, which agreed well with the present analyses; even the calorific values, which had been calculated by the formula of the American Coal Analysis Committee, were in close agreement. But the sulphur, determined by Eschka's method (*Chem. News*, 40, 237) was strikingly higher in many cases. Thus Coalbrookdale was 2.04, against 0.49; Brunner 2.35, against 1.03; Blackball 4.74, against 0.62; Kawa Kawa 4.92, against 1.22; Hikurangi 3.80, against 0.88; and Homebush 3.59, against 0.95. These coals were of lower cretaceous age, and the fossil resin was known as retinite, which was in no way related to the well-known kauri gum.

Mr. W. A. DIXON also thought the sulphur too low.

Mr. H. G. SMITH said that in the Sydney Technological Museum there were some good specimens of New Zealand coals showing the retinite mixed with them.

The AUTHOR, who was unable to be present, sent the following reply:—

"In the sulphur determinations, Eschka's method, igniting with magnesia and soda, was used, checked where the results seemed low by fusion with sodium carbonate and potassium nitrate."

I.—PLANT, APPARATUS & MACHINERY

(Continued from page 1163.)

Heat Engine; A New — M. Cantor. *Physik. Zeits.*, Nov. 9, 1905; through *Electrician*, 1905, 56, 225.

SINCE the efficiency of a heat engine depends upon the amount of expansion of the gases employed, that is to say, upon the ratio of the final to the initial volume, much better results would be obtained if an initial pressure capable of solidifying the gas, and thus reducing it to the smallest possible initial volume, were employed.

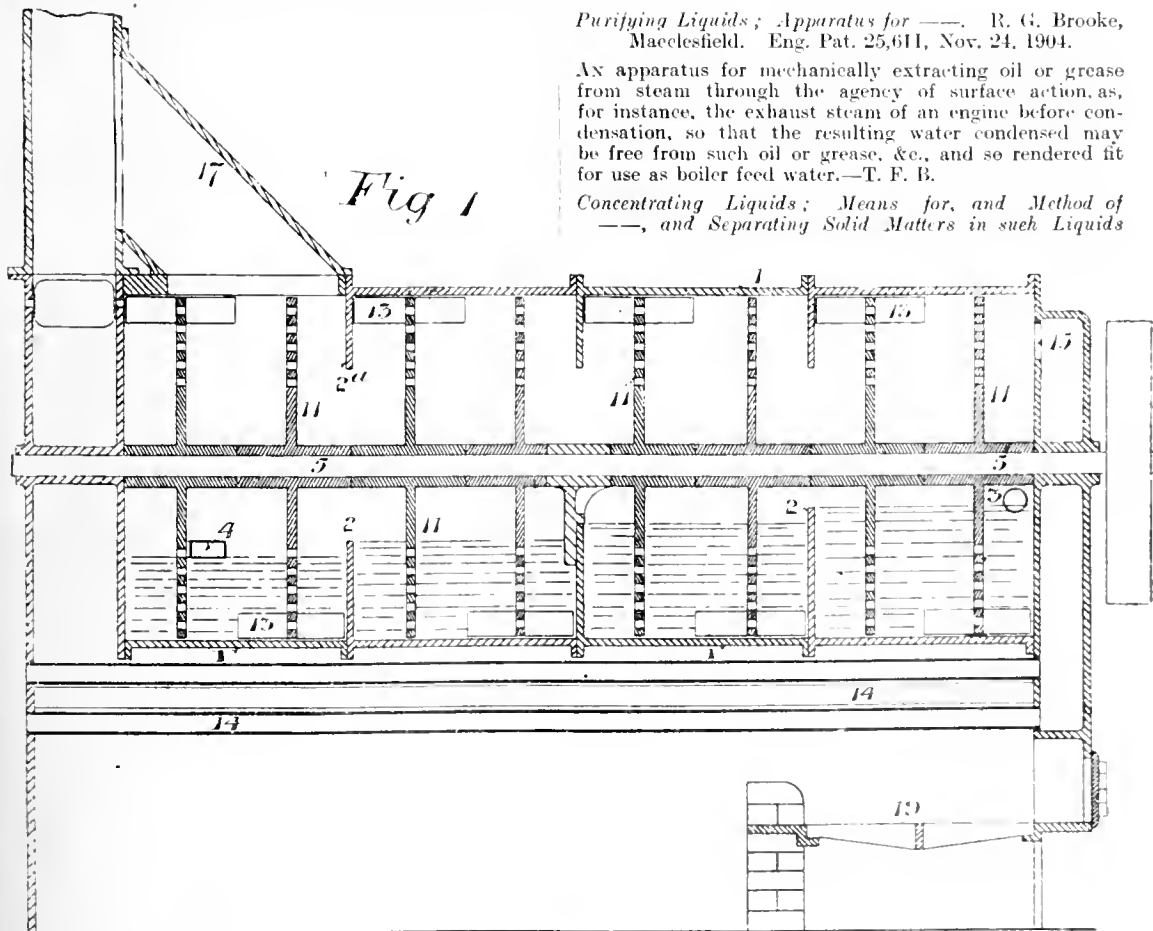

The following is suggested as a method of effecting this:—The engine is charged with copper oxide heated to incandescence, and is worked by blowing liquid fuel, e.g., petroleum, through the incandescent mass. The metallic copper produced is re-oxidised by a current of oxygen, the heat evolved being also utilised. The liquid fuel and the solid oxygen (contained in the copper oxide) have a very small initial volume, that of the oxygen being, in fact, only 1/7000 of its ordinary volume when in the gaseous state.—A. S.

ENGLISH PATENTS.

Purifying Liquids; Apparatus for — R. G. Brooke, Macclesfield. Eng. Pat. 25,611, Nov. 24, 1904.

AN apparatus for mechanically extracting oil or grease from steam through the agency of surface action, as, for instance, the exhaust steam of an engine before condensation, so that the resulting water condensed may be free from such oil or grease, &c., and so rendered fit for use as boiler feed water.—T. F. B.

Concentrating Liquids; Means for, and Method of —, and *Separating Solid Matters in such Liquids*

by *Evaporation of the Liquid*. F. Wertenbruch, Glasgow. Eng. Pat. 27,579, Dec. 17, 1904.

THE invention relates to an improved apparatus for concentrating liquids, where it is required to separate solid material without detriment. The liquor passes through an opening 3 (Fig. 1), into a horizontal drum 1

Fig 2

Fig 3.

(Figs. 1 and 2), with division plates 2 of varying height at the bottom and baffle-plates 2a, at the top. A shaft 5, carrying perforated discs 11, and paddles 13, traverses the centre of the drum, and on rotation churns up the liquid, thereby causing it to evaporate rapidly in a current of heated air which passes in through the pipes 14 and the inlet 15, and leaves the drum by the flue 17.

The air may be heated either by furnace gases or by a fire, 19, placed underneath the drum. The partially concentrated liquor runs out through the outlet 4, into a trough 21 (Fig. 3). It is then applied in a thin layer to the outer surface of an internally-heated revolving drum 23, by means of the roller 36, and the solid material which separates on the surface of the drum is removed

Fig 4.

by means of a scraper 37, and a conveyor 40. The whole is enclosed in an outer case 34, and frothing is prevented by the rotating fan 35. The speeds of the various parts of the apparatus are regulated according to the nature of the liquids.—B. J. S.

Evaporators, Feed Heaters and Condensers; Impts. in — D. Mathieson, Newcastle-on-Tyne. Eng. Pat. 28,396, Dec. 27, 1904.

THE claim is for causing the liquid to be heated or cooled and the heating or cooling agent to take opposite helical or spiral paths in separate adjoining conduits within a casing. The conduits may be formed by helical partitions, or by coils of piping, or by a combination of both within the casing.—W. H. C.

Evaporating Pans; Method of and Apparatus for Discharging Vacuum — H. A. Gill, London. From L. Tailfer, Paris. Eng. Pat. 29,392, Dec. 31, 1904.

THE solids separated during evaporation are discharged from the bottom of the pan, through a rotating plug-valve, into a vessel containing a similar-liquid to that which is being evaporated. All joints and openings through which air might leak into the apparatus are kept luted by the liquid.—W. H. C.

Separators; Centrifugal — N. S. Bök, Stockholm. Eng. Pat. 8256, April 18, 1905. Under Int. Conv., April 26, 1904.

SEE FR. Pat. 355,062 of 1905; this J., 1905, 1162.—T.F.B.

Condensing and like Apparatus; Impts. in —. La Soc. Anon. Westinghouse and M. Leblanc, Paris. Eng. Pat. 8452, April 20, 1905. Under Int. Conv., April 23, 1904.

A TURBINE 2, rotated in the reversed direction by the shaft 0, and supplied with water through the space 10 and the stationary jets 1, delivers the water in the form of spray into the chamber 3, into which the vapour to be condensed is led. The particles of water condense the vapour and pass out of the chamber through the passage 6, into the space 7, in which the pressure is equalised by the connecting channel 8. The spray then passes out through the ejector 9, at a high velocity, and draws with it any air that may have found its way into the chamber 3.—W. H. C.

Washing of Coal, Ore, and the like; Impts. in the —. F. Baum, Herne, Germany. Eng. Pat. 11,237, May 29, 1905.

See Fr. Pat. 355,097 of 1905; this J., 1905, 1162.—T.F.B.

Disintegrating Mills or Machines for Reducing Materials. J. Wüstenhöfer, Dortmund, Germany. Eng. Pat. 15,808, Aug. 2, 1905.

THE mill consists of a casing *a*, within which a series of drivers *d*, having "angle-shaped" end pieces *e*, are rotated by a central shaft. The interior of the mill is thus divided into a number of chambers, in each of which several rollers or balls *f*, are arranged. The material, which is introduced either by the hopper *h*, into the periphery, or into the interior by another hopper indicated by the dotted outline *g*, is ground between the balls or rollers *f*, and between them and the casing *a*. The ground material is thrown out through sieves placed at the end of the casing *a*, whilst any unground pieces are returned to the grinding zone by the wings *n*, and the projections *o*. The whole is enclosed in an outer casing provided with a conveyor to remove the ground material.—W. H. C.

FRENCH PATENTS.

Press; Autoclave —. E. Decauville.

Fr. Pat. 350,167, Sept. 10, 1904.

THE press consists of a press-plate *b*, which is surrounded by a cylindrical casing *g*, the ram *a* of the press passing through a stuffing-box in the bottom of the casing, which rests on the elastic rings *h* placed on the hydraulic jacks *i*, and is provided with guides working on the

pillars *f* of the press. When the press has been charged, the casing *g* is raised by the jacks *i* until the top *g*¹ of the casing makes a tight joint with the rib *c*¹ of the border *e* of the top piece of the press. The bolts are then screwed up and the ram *a* set to work until sufficient pressure has been applied. Steam or vapour can be introduced into the casing through the pipe *j*. The casing is free to expand in a vertical direction owing to the elasticity of the rings *h*, and should this be insufficient, further expansion is allowed by some of the liquid in the hydraulic jacks being forced back into the accumulator. The arrangement allows both mechanical and steam pressure to be applied simultaneously.—W. H. C.

Gases, Air Laden with Dust, &c.; Process and Apparatus for Purifying Blast-Furnace —, and for Dissolving Gases, &c., in Liquids. E. Barthelmeß. Fr. Pat. 355,562, June 21, 1905.

SEE Eng. Pat. 12,533 of 1905; this J., 1905, 1055.—T.F.B.

Separator; Continuous —. E. Wattier. Fr. Pat. 355,820, July 3, 1905.

A HORIZONTAL circular filtering surface, to the under side of which vacuum can be applied, is rotated below a feeding tank from which the material to be treated is fed regularly upon the upper surface of the filter. The liquid is drawn through, and the residue is removed from the surface of the filter by a worm conveyor.—W. H. C.

Heat-Insulating Material; Process for Manufacturing a —. G. G. Thomain and J. A. Gohier. Fr. Pat. 356,026, July 10, 1905.

STRONG glue (2 kilos.), resin (1 kilo.), alum (1 kilo.), and yellow gum-lac (50 grms.) are separately dissolved, and the hot solution mixed with 50 kilos. of cork and 18 litres of water. The mixture is next moulded under a pressure of about 200 kilos. per sq. cm., and then heated for three hours at a temperature of about 120° C., after which it is cooled and again heated for some time at about 50° C. For coverings for steam-pipes, the quantity of cork used is somewhat less, the quantities of adhesive ingredients being increased by about one-tenth.

The moulds used for making various forms of casings are also claimed.—A. G. L.

II.—FUEL, GAS, AND LIGHT.

(Continued from page 1164.)

Alcohol; Methods of Denaturing — employed in Different Countries. A. Lecomte. Bull. Assoc. Chim. Sucr. Dist., 1905, 23, 386—390.

TRIALS in a spirit motor of denatured alcohol from various countries showed the following classification in order of efficiency: Austrian, German, Italian, Russian, Swiss, French, the values being the means of tests for maximum power developed, power developed at half-charge and alcohol consumed per horse power.

The conclusion drawn is that the presence of wood-spirit lowers the calorific value of the alcohol. German spirit for motors contains only 0.5 per cent. of wood-spirit and 0.25 per cent. of acetone, Austrian contains no acetone, Russian contains 10 per cent. of wood-spirit and 5 per cent. of acetone, Swiss contains 5 per cent. of wood spirit and 2.2 per cent. of acetone, whilst French contains 7.5 per cent. of wood spirit and 2.5 per cent. of acetone. The formula recommended for use in Belgium for motor and lighting purposes is: 100 litres of 90 per cent. alcohol, 2.5 litres of methyl ethyl ketone containing about 0.2 litre of higher ketones, 1 litre of benzene.—J. F. B.

Fuels; Calorific Values of Motor —. Levi. Revue Technique; through Brewers' J., 1905, 41, 681.

THE following comparison between the calorific values of different fuels used in combustion engines is given:

	B.T.U. per lb
Methylated alcohol.....	10630
Methylated alcohol with 50 per cent. of petrol.....	14200
Crude American oil.....	19630
Refined American oil.....	19880

The mixture of alcohol and petrol can be used as easily as petrol, but with alcohol alone, it is necessary to warm up the carburettor before starting, since the alcohol is not sufficiently volatile at ordinary temperatures. The small quantity of acetic acid produced when alcohol is used, is not sufficient to cause any damage. If a deposit of soot occurs in the admission valves, the fault is generally due to the carburettor which should be of such a type as will deal with a measured quantity of the spirit at each suction stroke. The use of alcohol for motors is spreading in Germany, where the cost of this spirit is only 8d. per gallon; one great advantage is said to be the absence of smell.—J. F. B.

Coke; Properties of Good Blast-Furnace —. Weill. X., page 1234.

ENGLISH PATENTS.

[Gas] Retorts and the Charging of same; Impts. in Inclined —. T. and R. Redman, Bradford. Eng. Pat. 24,398, Nov. 10, 1904.

A NUMBER of inclined retorts 2a set in a suitable furnace communicate at their upper ends with a central shaft 3, through which they are charged after removing the cover 5, and through which the gas escapes to the hydraulic main by the connection 6. The lower ends of the retorts have mouth-pieces and doors 4, through which the coke is discharged. The retorts are charged by a special feeding apparatus, having as many compartments as there are retorts, and doors opposite the retort ends. This is filled with coal, lowered into the central shaft 3 and the doors opened, when the coal slides down into all the retorts simultaneously. The retorts may also be set parallel instead of in vertical tiers, in which case a pyramid is formed at the bottom of the central shaft to direct the coal into the retorts.—W. H. C.

Incandescent Bodies; [Mantles]; Impts. in —, and Method of making the Same. H. Reeser, Berlin. Eng. Pat. 16,018, Aug. 4, 1905.

CLAIM is made for the employment, in the manufacture of incandescent mantles, of a metal obtained from platinum ore, after separation of platinum, iron, osmium, iridium, palladium, ruthenium, rhodium, and all other known metals contained in the ore. The known metals in the ore are separated by treatment with acids and repeated evaporation and calcination of the dissolved ore, the metal for use in the mantle being obtained from the remaining

solution after evaporation and calcination. The mantle is constructed of this metal, or the metal may be deposited on a mantle constructed of nickel, nickel alloy, or other suitable material.—B. N.

UNITED STATES PATENTS.

[*Fuel Briquettes; Process of Manufacturing* — G. Höpfner, Berlin, Assignor to W. von Lewinski, Breslau, Germany. U.S. Pat. 804,193, Nov. 7, 1905.

[*Gas-Generator*. B. A. Sinn and F. H. Wagner, Baltimore, Md. U. S. Pat. 803,444, Oct. 31, 1905.

THE generator consists of an outer shell, below which is a sealed ash-pit. Above the ash-pit is the generator chamber proper, and above it a long filling hopper. Immediately above the generator chamber is an annular heating chamber, and above this a steam generator, provided with a number of flues, through which heated gases pass to the gas chamber which forms the top division of the apparatus. On the same level as the heating chamber, but outside the shell, is an air-heating chamber, provided with a conduit for conveying the heated air to the base of the generator. The hopper is extended down through the gas space, steam generator and the heating chamber to the dome of the gas generator. Means are also provided for conveying steam and water-overflow from the steam generator to the ash-pit.—W. C. H.

[*Gas; Process of Generating* — C. H. Claudel, Argenteuil, Assignor to Cie. du Carburateur Claudel, Paris. U.S. Pat. 803,557, Nov. 7, 1905.

SEE Fr. Pat. 331,372 of 1903; this J., 1903, 1122.—T. F. B.

[*Gas; Apparatus for the Manufacture of Generator* — P. Stiens, Rotterdam, Holland. U.S. Pat. 804,441, Nov. 14, 1905.

SEE Eng. Pat. 14,971 of 1904; this J., 1904, 977.—T. F. B.

[*Gas; Process of Generating* — E. Kreiz, St. Louis, Mo. U.S. Pat. 804,737, Nov. 14, 1905.

THIS is a process for generating gas from bituminous fuel. Bituminous fuel is ignited within a "fire-pot," and reduced to a red-hot mass, on which fresh fuel is piled, within a fuel chamber at the top of the fire-pot. At the same time the "inherent" smoke from the fuel chamber is withdrawn at a point above the flame and above the openings through which the gas makes its exit. Steam and air are injected into the red-hot mass above the grate, and simultaneously the gas is sucked out at a point below the top plane of the red-hot mass, and at a point below the new fuel contained within the fuel chamber, and below the plane of the smoke-exit opening.—W. C. H.

[*Gas Purifying Apparatus*. P. Plantinga, Cleveland, Ohio. U.S. Pat. 803,068, Oct. 31, 1905.

THE apparatus consists of a purifying chamber containing a series of adjacent, disconnected gas ducts. Each of these consists of a horizontal tube, composed of a solid circumference, except along the lower portion, where it is formed into a narrow channel which is expanded into a wider perforated portion, open at the bottom. Thus between two contiguous ducts there is an entirely free space, the upper and lower portions of which are contracted, and the middle portion, between two of the narrow channels, is enlarged.—W. C. H.

[*Gas-Purifier*. B. A. Sinn and F. H. Wagner, Baltimore, Md. U.S. Pat. 803,139, Oct. 31, 1905.

THE purifier consists of a bell, the bottom portion of which forms a water chamber. Above the water is a ring-plate having a central perforated depression, on the under side of which is an annular flange which projects into the water. A gas-inlet pipe enters the bell below the ring-plate, and is confronted by the downturned flange. At the side of the shell, and communicating with the water-chamber, is a water-trap. In the shell, above the ring-plate, is a number of grid or cross of bars, over which water is sprayed from above. Over the spray is a partition, forming an upper chamber in the shell, and a receptacle in this chamber. A pipe is arranged so that one end opens into this receptacle and the other end into the shell above the grids, whilst a gas-discharge pipe is connected with the shell above the partition, and between it and the perforated bottom of the upper chamber.—W. C. H.

[*Gas-Purifier*. A. Sahlun, London. U.S. Pat. 804,677, Nov. 14, 1905.

THIS apparatus for cleaning blast-furnace and other gases consists of an outer stationary shell provided with gas-inlets and outlets. Within the shell, and slightly eccentric to its axis, is a perforated drum, which is made to rotate by suitable means, and within which is a series of discs, arranged transversely to the axis, dividing the drum into compartments. In the space between the top of the drum and the outer shell are arranged, over alternate discs of the drum, diaphragms, by which the direction of the gases is changed so that they pass up out of one compartment and down the next. Above each compartment means are arranged for subjecting the perforated surface of the drum to the action of water. On the outer surface of the drum blades are arranged spirally to convey the used water and dust to the discharge exit. (See also this J., 1905, 610).—W. C. H.

[*Mantles; Method of Preparing Incandescent Gas* — C. M. Lungren, Bayonne, N.J., Assignor to The Safety Car Heating and Lighting Co., New York. U.S. Pat. 803,915, Nov. 7, 1905.

THE process consists in heating a mantle of varying thickness until the carbonaceous matter in the thinner portions is burned out, removing the mantle from the source of heat, in a glowing condition, and allowing the remaining carbonaceous matter to burn out. The entire mantle is then exposed to the direct action of a jet of flame, and the end by which it is secured to the member upon which it is mounted, is hardened by being independently heated.—W. C. H.

FRENCH PATENTS.

[*Carburetted Air Generator*. E. Chazel, First Addition, dated June 24, 1905, to Fr. Pat. 338,883, June 22, 1903.

A VERTICAL cylindrical casing is divided, by means of a conical partition, into two compartments, each of which contains a bell floating in water. The bell in the lower compartment serves as the air-pumping device, and supplies air as required to the bell in the upper compartment; from the latter the air is led to a carburetter, which is attached to the side of the casing. The lower bell is caused to move up and down by means of a rod, which is attached to the under side of the bell and is provided at its lower end with a piston which moves vertically in a cylinder, to the bottom and top of which water is admitted alternately, under pressure. Externally, three four-way cocks, for the water, air and hydrocarbon supplies respectively, are connected by means of linked levers, and are controlled by means of a weighted chain, attached to the top of the lower bell and bearing upon a toothed sector which is fixed to the air cock. When the bells have reached a pre-determined position, a tube, partly filled with mercury, tips over suddenly, and at once reverses the cocks. The main water-cock, which determines the movement of the whole apparatus, is connected by a rod with the upper bell, and is shut off automatically when the bell becomes full of air.—H. B.

Gaseous Mixture containing Hydrogen and Methane; Manufacture of a ——. P. Sabatier. Fr. Pat. 355,900. July 5, 1905.

WATER gas, Dowson gas, or any other gaseous mixture containing carbon monoxide and hydrogen, is passed, at a temperature of 300°–500° C., over nickel, cobalt, or iron (or a mixture of these), obtained by the reduction of their oxides. A mixture of carbon dioxide, methane and hydrogen is produced, and carbon is deposited on the metal. The carbon dioxide is removed from the gas by washing with caustic alkali or the like. The metal, with its deposit of carbon, is now heated to 400°–500° C., and steam is passed over it. The carbon is oxidised, with production of carbon dioxide and hydrogen, and these two gases react partially upon each other, forming methane and water; the resulting gas, consisting of methane, hydrogen and carbon dioxide, is then washed with caustic alkali, to eliminate the carbon dioxide. Gases containing carbon monoxide, but no hydrogen, may be utilised as above, the first phase of the process serving merely to produce a deposit of carbon, which is then treated with steam for the production of methane and hydrogen.—H. B.

Gas Purifier. W. Towns. Fr. Pat. 355,583. June 24, 1905.

SEE Eng. Pat. 10,993 of 1905; this J., 1905, 1164.—T.F.B.

Electrodes for Arc Lamps. E. Mendoza and R. Bueno. Fr. Pat. 350,186, Sept. 23, 1904.

ELECTRODES are moulded in the desired form, from a paste consisting of retort carbon, 400 grms.; coke, 400 grms.; graphite, 100; tar, 150; sugar syrup, 100; copper oxide, about 10; zinc oxide, about 10; and ferric oxide, about 10 grms. After baking the electrodes at a bright red heat, they are covered electrolytically with a metallic deposit in a bath composed of water, 1 litre; copper sulphate, 400 grms.; sulphuric acid, 50 grms.; platinum chloride, 2 grms.; potassium chloride, 5 grms.; and ferric chloride, 75 grms.—H.B.

Filaments for Incandescant [Electric] Lamps. A. Just and F. Hanaman. First Addition, dated June 10, 1905, to Fr. Pat. 347,661, Nov. 4, 1904. (See this J., 1905, 431.)

VERY thin filaments of carbon (0.02–0.06 mm.) are heated in an atmosphere containing tungsten hexachloride, molybdenum pentachloride, or a mixture of these, and a reducing gas such as hydrogen, whereby a metallic deposit is formed upon the carbon core. The filaments are then heated to a white heat for a short time in a reducing atmosphere at very low pressure, to convert all the carbon into carbide or other combined form. The carbon is finally removed by packing the filaments in the midst of finely powdered oxide of tungsten or molybdenum, and submitting them to a high temperature, whereby the carbon is oxidised.—H. B.

Coke Oven. M. E. Rothberg, Cleveland, Ohio. U.S. Pat. 804,033, Nov. 7, 1905.

THE coking-oven consists of a series of adjacent coking chambers, in the side walls of which is a number of horizontal reverting heating flues, which at one end are

connected, by vertical "off-gas" flues, with a transverse stack-draught flue in the foundation. Also in the foundation, and at the other end of the heating flues, is a transverse air-supply flue, parallel to the stack-draught flue. The air-supply flue is connected with combustion chambers under the ovens, and in the floor of the ovens are cooling flues, open at one end to the atmosphere, and means are provided for establishing a circulation of air through the cooling-flues, and air-supply flue in communication with the combustion chamber. Dampers are arranged for regulating the flow of air and gases. There is also an air-inlet chamber, connected with the air-supply flue, arranged under the ovens, which may be of a double-fronted arrangement. (See also U.S. Pat. 705,446 of 1902; this J., 1902, 1067.)—W. C. H.

Coke Oven. M. E. Rothberg, Cleveland, Ohio. U.S. Pat. 804,034, Nov. 7, 1905.

THE invention relates to a double-fronted coke oven, the longitudinal walls of which are hollow, and provided with a median transverse partition. On each side of the partition, and extending from the front to the middle of the ovens, is a set of vertical up-draught heating flues, and a set of vertical down-draught heating flues. Above each double set of heating flues, and extending from the front to the middle of the ovens, is a chamber into which they open. Under the ovens are combustion chambers having perforated walls dividing them from the chambers below the up-draught heating flues. The down-draught heating flues are connected with a central transverse "off-gas" flue in the foundation. Also in the foundation, at the fronts of the ovens and parallel to this flue, are air flues communicating with the air-distributing chambers below the combustion chambers. In the tops of the ovens are reverting air-flues, connected with the chambers over the heating flues, at the rear of the ovens, and burner openings are provided to these reverting air-flues. The central off-gas flue in the foundation has upwardly extending branches opening into chambers at the side of the chambers below the down-draught heating flues, and separated from them by perforated walls. In the floors of the ovens are cooling flues open at one end to the atmosphere, and at the other end connected to a yoke-flue and a fan and piping connections for drawing air through the cooling flues and discharging it through the air flues in the foundation. (See also U.S. Pat. 720,971 of 1902; this J., 1903, 357.)—W. C. H.

Bricks from Pitch and Coal-tar. A. Monicole and M. Dupont. Fr. Pat. 355,901, Jan. 10, 1905. IX., page 1233.

Ammoniacal Liquors resulting from the Manufacture of Lighting Gas; Apparatus for the Distillation of ——. J. Adriaanse. Fr. Pat. 355,971, July 7, 1905.

THE gas-liquor, after treatment with sodium carbonate to liberate the fixed ammonia, is passed through a reheater receiving its heat chiefly from a current of hot vapour arising from the vessel in which the ammoniacal vapours from the distilling column are saturated with sulphuric acid; but also in part from the residual liquor derived from the said column. The distilling column is constituted of successive superposed tiers of vessels to contain the liquid, which overflows from above to the vessels below, each of which is provided with an inverted immersed cap, enlarged at the bottom, for bubbling the gas set free through the liquor, in the usual manner. Some of these vessels are furnished with agitators; and, in case the liquor has not been treated with sodium carbonate, as described above, milk of lime is led into the two lower tiers of the column. The distillation may be promoted by circulating through the column the waste or exhaust

steam from the motor which serves to actuate parts of the apparatus. The process and apparatus may be modified in certain described ways.—E. S.

Wood Tar ; Process for Separation of — in the Distillation of Wood for Pyroligneous Acid. L. Meyer. Fr. Pat. 355,592, June 24, 1905.

By the neutralisation of crude pyroligneous acid with slaked lime, brown acetate of lime (68 per cent.) is produced. This is not such an important commercial product as the grey acetate of lime (80–82 per cent.), which can be obtained after a redistillation of the crude pyroligneous acid. This invention is an attempt to provide an economical method of completely purifying the distillation products of wood from the accompanying wood tar by a process of continuous fractional distillation. Instead of passing the products from the distillation of wood directly into a condenser, as is now commonly done, the volatile matter is made to circulate through several chambers, arranged either alongside one another or one above the other. The vapours are made to pass through these chambers in a finely divided condition, the chambers being kept at a convenient temperature. In this way the whole of the tar can be removed and chamber liquids of different boiling point obtained. In starting a distillation, the vapours may be washed by introducing into the chambers liquids of similar composition to those afterwards condensed there. The pyroligneous acid, which is condensed after removal of the tar, gives an acetate of lime containing 80–82 per cent. without further distillation.—C. E. F.

Petroleum and Analogous Substances ; Rectifying —. A. Pollet. Addition, dated June 15, 1905, to Fr. Pat. 351,519, Feb. 15, 1905 (this J., 1905, 885).

An improved arrangement of baffles is provided, so as to prevent the vapours ascending the sides of the vessel without encountering the screens designed to hinder the escape of the volatile particles.—C. S.

IV.—COLOURING MATTERS AND DYE STUFFS.

(Continued from page 1168.)

Iron-Cyanogen Compounds ; Blue —. K. A. Hofmann and F. Resenschek. II. Annalen, 1905, 340, 267–275. (See also this J. 1904, 1209.)

ALL the blue iron cyanides contain the tetravalent ferrocyanide group, more or less completely combined with ferric iron. The simplest member of the group, water-soluble Prussian Blue, is obtained by the action of 1 mol. of potassium ferrocyanide on 1 mol. of a ferric salt, or of 1 mol. of potassium ferricyanide on 1 mol. of a ferrous salt, in the absence of acid in aqueous solution, and corresponds to the formula $KFe'''[Fe(CN)_6] + aq$. By complete displacement of the potassium in this compound by ferric iron, insoluble Prussian Blue, or Turnbull's Blue is obtained, the two products being identical. Williamson's Violet, which is formed by the oxidation of the residue obtained in the preparation of hydrocyanic acid, has the same empirical formula as water-soluble Prussian Blue, with the exception of a slight difference in the quantity of water. The two substances are, however, undoubtedly different, as apart from the difference in colour, Williamson's Violet is insoluble in water and in oxalic acid, does not part with alkali under the influence of dilute mineral acids, and is only very slowly decomposed by ammonia solution. It has probably the constitutional formula $KFe(CN)_6 : Fe'''(CN)_6 : FeK + aq$. When equimolecular amounts of ferrous sulphate and potassium ferrocyanide react in aqueous solution in the absence of free acid, a white precipitate is obtained, which rapidly oxidises in the air, forming a blue which resembles ordinary soluble Prussian Blue in being soluble in water and also in being rapidly decomposed by ammonia. Its behaviour towards oxalic acid is, however, characteristically different, and will be further discussed in a later communication (see below). If the reaction between ferrous sulphate and

potassium ferrocyanide take place in presence of about 1 per cent. of free sulphuric acid, the white precipitate formed is much more stable towards atmospheric oxygen, and, when oxidised, forms a blue which behaves in a completely different manner to ordinary soluble Prussian Blue or Williamson's Violet. This blue has not been previously studied, and is called by the authors "Water-soluble, stable Blue," as it is much more resistant to ammonia or acids. It is prepared as follows: To a solution of 21 grms. of potassium ferrocyanide ($\frac{1}{2}$ mol.) in 500 c.c. of water, a solution of 13 grms. of pure ferrous sulphate ($\frac{1}{2}$ mol.) in 100 c.c. of water and 50 c.c. of 20 per cent. sulphuric acid is gradually added with continuous stirring. Oxidation is then effected by stirring for some days in the air in a shallow vessel. The substance is washed, and if necessary precipitated, by means of a mixture of equal volumes of alcohol and $\frac{1}{2}$ per cent. aqueous sulphuric acid. It is dried over sulphuric acid, powdered, and further dried *in vacuo* over phosphorus pentoxide until its weight is constant. The empirical formula of the product is $KFe[Fe(CN)_6] + H_2O$. It is soluble in water and in 10 per cent. oxalic acid with a bright blue colour. On adding excess of 4 per cent. ammonia solution at 10° C., a blue precipitate forms after a few minutes only, and then gradually changes to olive-green, and in 6–7 minutes to reddish-brown ferric hydroxide. The filtrate contains ferrocyanide, but no ferricyanide. On treatment of the dissolved blue with 10 per cent. hydrochloric acid for several hours at the ordinary temperature, blue flocks are formed, which are insoluble in pure water after washing, but still behave towards ammonia or oxalic acid in the same manner as the original substance. This process is due to a removal of alkali which is not effected by very dilute ($\frac{1}{2}$ per cent.) acid. The new blue is gradually precipitated in an apparently unchanged condition by ferric chloride, which converts ordinary soluble Prussian Blue into Insoluble Blue. Aqueous solutions of the new blue show no apparent depression of the freezing point, indicating that they are colloidal, a supposition borne out by their behaviour in an electrical field, the blue substance travelling to the anode, and being there precipitated. This view is also confirmed by the optical properties of the liquid, but no granular structure could be detected microscopically and nothing was retained on passing through a hardened filter. The new blue can also be prepared by completely precipitating potassium ferrocyanide with a ferrous salt, adding another molecule of potassium ferrocyanide in presence of free acid, and then oxidising with hydrogen peroxide. From this fact, together with its considerable resemblance in behaviour to Williamson's Violet, the authors deduce the following formula:

Water soluble, stable Prussian Blue,

Williamson's Violet,

By the action of potassium ferricyanide on ferric-ammonium-alum in presence of hydrogen peroxide, precipitates are obtained, identical with those obtained from ferric salts and potassium ferrocyanide, the ferricyanide being reduced. If, however, 5 per cent. of free hydrochloric acid is added to the brown mixture of potassium ferrocyanide solution and excess of ferric-ammonium-alum (3 mols.), then, on adding hydrogen peroxide, the reduction takes place much more slowly, and a copious precipitate is only formed in about 24 hours. This precipitate has a purple lustre, is insoluble in water and in oxalic acid, and only differs from Williamson's Violet in properties by being less stable towards 4 per cent. ammonia solution. On analysis, however, it is found to be an isomeride of insoluble Prussian Blue, of the formula $Fe_7C_{18}N_{18} + 10H_2O$.—E. F.

Iron-Cyanogen Compounds ; Blue — and the Cause of their Colour. III. K. A. Hofmann and F. Resenschek. Annalen, 1905, 342, 364–374.

WHEN 1 mol. of potassium ferrocyanide reacts with 1 mol. of a ferrous salt in hot, mineral acid solution, Williamson's Violet is obtained on subsequent oxidation. If

the above-mentioned substances react in the cold, a blue compound of identical composition, excepting a difference in the percentage of water, is obtained on oxidation, as was described in the last communication, and was named by the authors "Water-soluble, stable Prussian Blue." (See preceding abstract.) When 1 mol. of ferrous salt reacts with 1 mol. of potassium ferrocyanide in the absence of acid, another water-soluble blue is obtained on oxidation. This blue, which has not hitherto been distinguished from ordinary soluble Prussian Blue is of technical importance, as its formation explains the use of an admixture of a ferrous salt in preparing technical Prussian Blue. It is prepared as follows: 24 grms. of ferrous sulphate are dissolved in 1 litre of water, filtered and gradually added with stirring to a filtered solution of 42 grms. of potassium ferrocyanide in 1.5 litres of water. The white precipitate oxidises gradually in the air, or more quickly after adding neutral hydrogen peroxide solution, to the new blue, which is washed with a 1 per cent. potassium chloride solution, and finally with 50 per cent. alcohol. It is then dried *in vacuo*. The product is soluble in water with a greenish-blue colour, but insoluble in oxalic acid solution. On adding 1 per cent. of sulphuric acid to its aqueous solutions, the blue is precipitated and becomes insoluble in water owing to loss of alkali, whereas ordinary soluble Prussian Blue, though it loses alkali under the same treatment, is only precipitated very slowly and does not become insoluble in water, unless dried. The new blue is decomposed by 4 per cent. ammonia solution in a few seconds, forming ferric hydroxide and a ferrocyanide. On analysis, it yields figures corresponding to the formula, $\text{FeKFe}(\text{CN})_6 \cdot \text{H}_2\text{O}$. The authors consider it to be probably $(\text{Fe}^{++}(\text{OH})\text{KH}.\text{Fe}(\text{CN})_6)$, whilst to ordinary soluble Prussian Blue they assign the formula $\text{Fe}^{+++}(\text{OH})_2.\text{KH}_2\text{Fe}(\text{CN})_6$. Various experiments are cited in support of this view. The blue colour of the iron-cyanogen pigments is probably due to the simultaneous presence of iron of two different degrees of valency in the same molecule, and it is pointed out that the presence of atoms of the same element of various degrees of valency in the same molecule usually leads to strong light absorption. *Aethiops martialis* (containing ferric and ferrous hydroxides), red lead, sulphur sesquioxide, various complicated platinum compounds and tungsten compounds, U_3O_8 , Mo_3O_8 and Bi_2O_3 are cases in point.—E. F.

Eosine: Products Obtained by the Autoxidation of —. A. Hefft r. Ber., 1905, 33, 3633—3634.

EOSINE solutions bleach slowly in the dark, much more quickly in direct sunlight. The action is accelerated by the presence of alkali. In absence of alkali strong eosine solutions deposit tetrabromofluorescein in sunlight, showing the formation of acids which decompose the potassium salt of eosine. A $\frac{1}{2}$ per cent. eosine solution, containing 1 per cent. of sodium hydroxide, was exposed to sunlight whilst a current of air was passed through until the red colour changed to pale yellow. The liquid gave no peroxide reaction, but contained large quantities of bromides. On acidifying with hydrochloric acid, much carbon dioxide was evolved. The liquid was then extracted with ether, which, on evaporation, left a residue consisting of oxalic and phthalic acids and small quantities of a reddish-brown oil. Thus the main products are hydrobromic, carbonic, oxalic and phthalic acids. The latter was only isolated in much less than the theoretical quantity.—E. F.

Azo Dyestuffs; Preparation of New —. Farbenfabr. vorm. F. Bayer und Co. First Addition, dated Jan. 9, 1905, to Fr. Pat. 347,376, Oct. 24, 1904 (this J., 1905, 329). Under Int. Conv., Oct. 31, 1904.

TETRAZOTISED benzidine- or tolidine-*m*-disulphonic acid is combined with 1 mol. of 1-phenyl-3-methyl-5-pyrazolone or α -methylindole, and 1 mol. of β -naphthol, instead of with 2 mols. of either 1-phenyl-3-methyl-5-pyrazolone or α -methylindole as described in the main patent. The new products are stated to dye wool from an acid bath in orange shades fast to milling, which do not bleed into the white when washed.—H. L.

Azo Dyestuffs; Preparation of New —. Farbenfabr. vorm. F. Bayer und Co. Second Addition, dated Jan. 12, 1905, to Fr. Pat. 347,376, Oct. 24, 1904 (this J., 1905, 329). Under Int. Conv., Nov. 18, 1904.

TETRAZOTISED benzidine- or tolidine-*m*-disulphonic acid is combined with 2 mols. of nitro-*m*-phenylenediamine, or with 1 mol. of this substance and 1 mol. of either α -methylindole or 1-phenyl-3-methyl-5-pyrazolone or β -naphthol. Wool is dyed by the products from an acid bath in greenish-yellow to orange shades of similar fastness to those produced by the dyestuffs of the main patent. (Compare preceding abstract.)—H. L.

Dyestuffs [Monoazo]; Production of New —. Farbenfabr. vorm. F. Bayer und Co. Fr. Pat. 355,046, March 21, 1905. Under Int. Conv., June 1, 1904.

THE new dyestuffs are prepared by combining diazo compounds with the thiazolsulphonic acids claimed in Fr. Pat. 353,928 of 1905 (see this J., 1905, 1041) and its First Addition also of 1905 (see this J., 1905, 1168).

Example 1.—The thiazolsulphonic acid prepared from 2-benzylidene-amino-5-hydroxy-naphthalene-7-sulphonic acid is combined with diazobenzene in sodium carbonate solution. The product dyes cotton directly in scarlet shades, fast to acids.

Example 2.—The thiazolsulphonic acid derived from 2-*m*-nitro-benzylideneamino-5-hydroxynaphthalene-7-sulphonic acid is combined with diazotised *o*-anisidine. The product dyes cotton in bluish-red shades, which may be diazotised on the fibre and developed with β -naphthol. A red, of yellower shade, fast to washing, is thus obtained. The shade of a number of analogous dyestuffs, prepared by the combination of diazo compounds such as those of aniline, *o*-toluidine, xylylene, *o*-anisidine and β -naphthylamine on various thiazolsulphonic acids is shown in a table. In all cases cotton dyestuffs of yellowish to bluish-

red or scarlet shade are obtained. The thiazol-sulphonic acids prepared from nitrobenzylidene derivatives yield dyestuffs which may be diazotised on the fibre and developed with β -naphthol.—H. L.

Dyestuffs of the Anthracene Series; Production of —, Soe, Anon. Prod. F. Bayer et Cie. First Addition, dated June 16, 1905, to Fr. Pat. 343,608, March 29, 1904.

SEE U.S. Pat. 775,369 of 1904; this J., 1904, 1210.—T. F. B.

Dyestuffs of the Anthraquinone Series, and Intermediate Products for their Manufacture; Production of —, Farbenfabr. vorm. F. Bayer und Co. Fr. Pat. 355,326, June 17, 1905.

By nitrating urethanes of the anthraquinone series new nitro derivatives are obtained, containing the nitro group in the ortho-position to the —NH.COOR group. These are converted into new *o*-nitroaminoanthraquinones by hydrolysis, and thence by reduction to *o*-diaminoanthraquinones. These *o*-diaminoanthraquinones are condensed with *o*-diketones and yield new dyestuffs, probably azines, which dye cotton, after the fashion of indigo, from an alkaline reducing vat.

Thus, by nitrating the urethane of β -aminoanthraquinone (prepared by boiling β -aminoanthraquinone with ethyl chlorocarbonic acid, $(\text{C}_2\text{H}_5\text{OOC})_2\text{H}_2$), a mixture of the urethanes of 1,2- and 3,2-nitroaminoanthraquinone is obtained. These may be separated by crystallisation from nitrobenzene or glacial acetic acid and are then saponified by concentrated sulphuric acid, and purified by recrystallisation from pyridine. On reduction 1,2- and 2,3-diaminoanthraquinone are obtained respectively. The condensation with *o*-diketones is carried out in hot glacial acetic acid solution. The azine from 2,3-diaminoanthraquinone and β -naphthoquinone dyes cotton in orange shades from an alkaline hydrosulphite vat; the corresponding dyestuff from β -anthraquinone dyes cotton in blue shades. A green "vat" dyestuff is obtained by condensing 2,3-diaminoanthraquinone with an oxidation product of Alizarin Blue. This oxidation product is prepared by treating Alizarin Blue with nitric acid (42°B.) at $10^\circ\text{—}20^\circ\text{C.}$, in glacial acetic acid suspension. It crystallises out in yellow prisms, which are reconverted into Alizarin Blue by reduction, and dissolve with a yellow colour in sulphuric acid and organic solvents.

Similar dyestuffs derived from 1,2-diaminoanthraquinone are also described.—H. L.

Anthracene; Production of New Derivatives of —, Badische Anilin und Soda Fabr. Fr. Pat. 355,100, June 8, 1905. Under Int. Conv., March 24 and 25, 1905.

A YELLOW dyestuff, producing greener and brighter shades than Flavanthrone, is prepared by heating β -methylantraquinone with condensing agents such as caustic alkalis, alcoholic potash or caustic soda, &c. It may be dyed on cotton from a hydrosulphite or other alkaline "vat," and printed on fabrics either (1) in the presence of an alkali, with or without a reducing agent, or (2) in the presence of a reducing agent only. In the former case the goods are steamed; in the latter case, passed through an alkaline bath after printing. Two detailed recipes for dyeing cotton from a hydrosulphite vat and two recipes for printing on fabrics are given. The fastness of the shades thus obtained to light, chlorine, acids, washing and boiling is stated to be excellent.

The substance is insoluble in alkali and dissolves in concentrated sulphuric acid with a bright bluish-red coloration. The molecular composition is given as $\text{C}_{30}\text{H}_{14}\text{O}_4$, probably represented by the formula:—

Two mols. of β -methylantraquinone are probably condensed together in the methyl groups. Halogen derivatives of ω -methylantraquinone substituted in the side chain, such as ω -chloro- or bromo- β -methylantraquinone, β -dichloro- or dibromo- β -methylantraquinone show the same reaction.—H. L.

Anthracene; Production of New Derivatives of —, Badische Anilin und Soda Fabr., Fr. Pat. 355,929, July 5, 1905. Under Int. Conv., Aug. 22, 1904.

SEE Eng. Pat. 1817 of 1905; this J., 1905, 949.—T. F. B.

Indigo and its Homologues and Derivatives; Process of Reducing —, Badische Anilin und Soda Fabr., First Addition, dated July 5, 1905, to Fr. Pat. 348,360, Nov. 29, 1904. Under Int. Conv., May 13, 1905. (See this J., 1905, 195.)

Indigo may be reduced by means of iron by the use of concentrated solutions of alkali carbonates, sulphates, or phosphates. Also the alkali hydroxide used in the process described in the principal patent, may be replaced wholly or partially by the disodium salt of indigo white; the indigo dissolves as it is reduced, and the monosodium salt of the indigo white remains in solution until it is converted into indigo white by fresh addition of indigo. At that juncture, the addition of alkali hydroxide is necessary to form the disodium salt. For example, 100 kilos. of the disodium salt of indigo white, in 30 per cent. solution, are heated with 20 kilos. of indigo and 20 kilos. of finely divided iron to about 75°C. The filtered liquid is stated to contain 40 per cent. of indigo white.—T. F. B.

Dyestuffs; Process for the Production of Brown Sulphide —, K. Gehler. Fr. Pat. 355,783, June 30, 1905.

SEE U.S. Pat. 801,598 of 1905; this J., 1905, 1167.—T. F. B.

GERMAN PATENTS.

Dyestuff which Dyes Clear Yellow Shades on Unmordanted Cotton; Process of Preparing a Sulphide —, Farbwerke vorm. Meister, Lucius und Brüning. Ger. Pat. 161,515, Feb. 25, 1903.

ONE part of monoacetyl-1,2,4-triaminobenzene is melted with 2 parts of sulphur, and the melt maintained at a temperature of 250°C. The resulting dyestuffs give clear fast yellow shades on unmordanted cotton from sodium sulphide baths.—T. F. B.

Lakes [from Azo Dyestuffs] Fast to Light; Process of Preparing Red —, Farb. vorm. Meister, Lucius und Brüning. Ger. Pat. 161,424, March 30, 1904. XIIA., page 1244.

Dyestuffs; Process of Preparing Red [Sulphide] —, Anilin-farben- und Extrakt-Fabr. vorm. J. R. Geigy. Ger. Pat. 161,516, May 5, 1903.

By heating resorcinol and dimethylaniline or dimethyl-*o*-toluidine with sulphur at a high temperature, dyestuffs are obtained which, though of no value alone for dyeing purposes, are useful for imparting a red shade to dyeings with other sulphide dyestuffs. Red dyestuffs are formed at first (or if too little sulphur be used), and are converted into Corinth-red dyestuffs on further heating.—T. F. B.

Dyestuffs; Process of Preparing Orange-Yellow to Orange-Red Basic —, Anilin-farben- und Extrakt-Fabr. vorm. J. R. Geigy. Ger. Pat. 161,699, Sept. 4, 1904. Addition to Ger. Pat. 149,409 March 10, 1903.

THIS patent constitutes an addition to Fr. Pat. 330,487 of 1903, and its addition (this J., 1903, 1082 and 1241). Formylated aromatic *m*-diamines are heated either alone or with primary or alkylated *m*-diamines or with alkylated *m*-aminophenols, in presence of ammonium salts or amino bases. The best proportions to use are 1 mol. of the formyl compound to 1–2 mols. of the second component. With ammonium salts the temperature of reaction is $200^\circ\text{—}250^\circ\text{C.}$, with amino bases from $150^\circ\text{—}200^\circ\text{C.}$ The dyestuffs dye tanned cotton and leather in various shades of orange.—T. F. B.

Dyestuffs from Aminoanthraquinonesulphonic Acids; Process of Preparing Azo —, Farbenfabr. vorm. F. Bayer und Co. Ger. Pat. 161,151, May 30, 1903.

AMINOANTHRAQUINONESULPHONIC acids are diazotised and combined with naphtholsulphonic acids. The dye-

stuffs prepared from the following are described:—1,2-aminoanthraquinonesulphonic acid and 1,5,2,6-diaminoanthraquinonedisulphonic acid with 2,3,6-naphtholdisulphonic acid; 1,6-aminoanthraquinonesulphonic acid with 1,3,6-naphtholdisulphonic acid. These dyestuffs dye wool yellowish-red to bluish-red shades, and are stated to produce fast lakes of fine colour by the usual methods.—T. F. B.

Dyestuffs; Process of Preparing Polyazo —. Kalle und Co., A.-G. Ger. Pat. 161,720, Nov. 29, 1903.

DIAZOTISED acet-*p*-phenylenediamine is combined with a phenol or amine, the acetyl group is removed, and the dyestuff is diazotised and combined in alkaline solution with 1-*p*-aminobenzeneazo-2,5,7-aminonaphtholdisulphonic acid. The dyestuffs give black shades when dyed directly, and various shades of blue when developed with β -naphthol. The dyeings are stated to be very fast.—T. F. B.

Dyestuffs suitable for Preparing Lakes; Process of Producing Monoazo —. Kalle und Co., A.-G. Ger. Pat. 162,180, Aug. 30, 1904.

THE diazo compounds of 2,6,8- or 2,5,7-naphthylaminedisulphonic acids, or of 2,3,6,8-naphthylaminetrisulphonic acid are combined with β -naphtholdisulphonic acid R. The lakes, prepared in the usual manner from these dyestuffs, are very fast to light and water, and are bluish-red in colour.—T. F. B.

Indigo; Process of Preparing Stable Chloro-derivatives of —. Badische Anilin und Soda Fabrik. Ger. Pat. 160,817, Feb. 24, 1904.

STABLE chloro-derivatives of indigo or its homologues are obtained by the action of chlorine on indigo in absence of water, and in presence of a halogen compound of phosphorus or sulphur. The action of dry chlorine on dry indigo, and the chlorination in presence of indifferent solvents, give rise to products from which the chlorine is split off by caustic alkali.—T. F. B.

Dyestuffs; Process for Preparing o-Hydroxyazo [Azo] —. Badische Anilin und Soda Fabrik. Ger. Pat. 162,009, March 27, 1904. Addition to Ger. Pat. 160,536, Jan. 8, 1904.

THE diazo compounds of mono- or polysulphonic acids or chloro derivatives of 1,2- or 2,1-naphthylaminesulphonic acids are converted into the corresponding o-hydroxy-diazo compounds by treating them in acid solutions, with hydrogen peroxide or an alkali or alkaline earth peroxide or persulphate; by this means the o-sulphonic group is replaced by a hydroxyl group. (Compare Eng. Pat. 15,925 of 1904; this J., 1905, 668.)—T. F. B.

Dyestuffs suitable for Preparing Lakes; Process for Producing Yellow to Orange-yellow Monoazo [Azo] —. Badische Anilin und Soda Fabrik. Ger. Pat. 161,277, July 27, 1904. Addition to Ger. Pat. 156,552, Sept. 10, 1903.

THE nitro-*m*-phenylenediamine or nitro-*m*-toluylenediamine in the principal patent (this J., 1905, 434) are replaced by nitro-*m*-phenylenediaminesulphonic acids. The presence of the sulphonic group makes the dyestuffs suitable for lake manufacture; the dyestuffs are also stated to be faster to light than those formerly described.—T. F. B.

Dyestuffs; Process for Preparing Green Sulphide —. Chem. Fabr. vorm. Sandoz. Ger. Pat. 162,156, May 25, 1904.

1-PHENYL- or tolylamino-4-*p*-hydroxyphenylaminonaphthalenemonosulphonic acids are heated with alkali polysulphides, with or without a copper salt. In the former case green, and in the latter yellowish-green, dyestuffs are obtained, which yield shades fast to light and washing. (Compare Fr. Pat. 343,377 of 1903; this J., 1904, 1026.)—T. F. B.

V.—PREPARING, BLEACHING, DYEING, PRINTING, AND FINISHING TEXTILES, YARNS, AND FIBRES.

(Continued from page 1170.)

Dyeing [Silk Weighting] Process; The —. I.X. *The Tin Phosphate Process*. P. Heermann. Färber-Zeit., 1905, 16, 323—326, 340—343.

SILK was treated first with tin chloride solution (30° B.) and then with disodium phosphate solutions of various strengths and at different temperatures. It was found that the maximum amount of phosphoric acid was taken up when a 10° B. phosphate solution was used at a temperature of 75° to 100° C. Under these conditions the ratio of tin to phosphorus on the fibre agrees with the formula $P_2O_5 \cdot 3SnO_2$; it was found, however, that this compound was not actually present, but that a mixture of a compound $P_2O_5 \cdot 2SnO_2$ and a basic tin phosphate was formed. Experiments performed by the author indicated that the tin hydroxide first combined with a molecule of the phosphate, forming a compound $Sn(ONa)_2H_2PO_4$ (the tin acting at the same time as an acid and a base), which is decomposed in the subsequent washing, with liberation of sodium hydroxide (which combines with the excess of phosphate, forming the normal phosphate), the basic phosphate being produced. This is in part decomposed in drying, with loss of water, to form the phosphate $P_2O_5 \cdot 2SnO_2$.—T. F. B.

Cotton Colours Fast to Cross Dyeing. G. Richter. J. Soc. Dyers and Colourists, 1905, 21, 306—307.

COTTON is cheaper than wool for obtaining coloured thread effects on dress goods, &c., as the goods can be dyed in the piece, and a large number of different effects can be produced by cross-dyeing. For obtaining "melange" effects the loose cotton is dyed with colours fast to cross-dyeing, mixed with white wool, and the whole dyed in the piece. Ramie may also be used for this purpose. For other purposes the ground colour is dyed on the yarn or loose wool. Many basic colours are fast to cross-dyeing if subjected to after-treatment with tannin and tartar emetic or antimony salt. The cotton yarn is entered into a 2—6 per cent. tannin bath at 60° C. and left in the slowly cooling bath for three to four hours. The tannin, which may be replaced by sumach for dark shades, is fixed with half its weight of tartar emetic or antimony salt in a cold bath for half an hour. The goods are dyed in presence of acetic acid or alum, and are entered into a lukewarm bath, which is finally heated to 80° C. The after-treatment with tannin is performed in one hour in the cold, and is followed by treatment with tartar emetic for 10 to 15 minutes.—E. F.

Mixed Cotton and Wool Tissues; Printing —. E. Justin-Müller. Rev. Gén. des Mat. Col. 1905, 9, 313—315.

TO produce printed tissues, consisting of about equal parts of cotton and wool, which, in feel and appearance, bear greater resemblance to wool than to cotton tissues, it is essential that the tissues in question shall not be woven from cotton warp- and woollen weft-yarns, as is frequently the case, but that they shall be composed of yarns in which the cotton and wool fibres have been carded and spun together.

Operations Preparatory to Printing.—The tissues, before printing, should be "crabbed," i.e., repeatedly passed through boiling water and pressed, or "decatized" by wrapping them upon a perforated pipe through which steam is thereupon passed. They may with advantage undergo both of these operations. The object of this preliminary treatment is to give the tissues greater firmness and tenacity and to enable them to withstand the subsequent operations without becoming crinkled or deformed. The usual practice of chlorinating the tissues to give the wool greater capacity for absorbing the dyestuff-mixtures which are printed upon them, is not to be recommended, as the wool is not only rendered yellowish in colour but harsh to the touch and the mixed tissues then appear too much like cotton tissues. It is found that by adding phenol to the printing-mixtures, the same

full shades may be produced upon unprepared tissues, as are obtained upon chlorinated tissues from the ordinary printing mixtures.

Printing.—The direct cotton dyestuffs are the most suitable dyestuffs for printing mixed cotton and wool tissues. Some of these yield identical shades on the wool and the cotton. Most of them, however, give on the two fibres colours which differ from each other. To produce the same shades, it is often necessary to add to the printing-mixtures small proportions of "complementary" dyestuffs, which colour the wool only, such as Formyl Violet S4B, Formyl Blue B, Lanacyl Blu BB, Lanacyl Violet B, Thio carmin R, Indian Yellow G, Naphthol Black 12B and similar acid dyestuffs. The following recipe represents the general composition of the printing-mixtures employed:—5–50 grms. of a direct cotton ("diamine") dyestuff, 0.5–5 gm. of a "complementary" dyestuff, 300 c.c. of boiling water, 70–100 c.c. of a dilute solution of ammonium citrate (added only when the water used is calcareous), 500 grms. of a neutral or slightly alkaline thickening-mixture, 90–100 c.c. of glycerin, and 35 grms. of phenol.

Steaming.—Before being submitted to this operation, the tissues are "damped" in the same manner as printed woollen tissues. They are then wrapped in dry steaming cloths and steamed for an hour without pressure. After this, they are washed in a plentiful supply of water.

Finishing.—Finishing is a very important operation in the case of mixed cotton and wool tissues. The use of all materials which are likely to impart stiffness to the tissues, is to be rigorously avoided. When it is necessary to "fill" the tissues, only such thickening materials, as gum tragacanth and Irish moss, which give a pliant finish, may be used, along with softening agents, namely, fatty matters, &c. The object of finishing is to render the cotton in the tissues as soft and supple as possible.

Discharging Dyed Textiles; Application of Bromine Salts for —. F. Erban. *Färber-Zeit.*, 1905, 16, 337–340.

A MIXTURE of sodium bromide and bromate, previously used by Koppeschaar for brominating phenol (for its determination) is suggested as a suitable source of bromine for use in discharging dyeings. This mixture is made by slowly adding 5 kilos. of bromine to 6.25 litres of caustic soda liquor (36° B.), keeping the temperature below 35° C., allowing to stand for two hours, and then evaporating to dryness. The product contains about 70 per cent. of bromine, which is liberated by acids. In many cases, acetic acid may be used in conjunction with the bromate mixture, but in certain cases bromination occurs, whilst in others, the acetic acid is set free by steaming, and the bromine is partially used up in oxidising the glycerin; the discharge of Alizarin dyeings with the use of acetic acid was unsatisfactory, owing to the partial re-formation of lakes after discharging. The dialkyl esters of oxalic acid, especially dimethyl oxalate, are, however, very suitable for the purpose, since the oxalic acid prevents any re-formation of lakes (e.g., in working with Alizarin), and the alkali oxalate which is produced is oxidised by any excess of bromine. A suitable discharging mixture consists of 100 grms. of gum solution or other suitable thickening: 40–50 grms. of the bromate mixture, and 21–26 grms. of dimethyl oxalate (in alcoholic solution). An ammonium salt may be used instead of dimethyl oxalate, but there is more danger in this case of the fibre being attacked by the bromine.—T. F. B.

Carbonising Wool, Rags, Silks and other Fibres. S. Roberts, Liversedge, Yorks. Eng. Pat. 4593, Mar. 6, 1905.

Wool, and other animal fibres are freed from vegetable matter by immersing them in a bath of dilute acid through which an electric current is passed. Sulphuric acid of 5–7° Tw., or hydrochloric acid of 3–5° Tw. is used in an insulated bath. The bath is electrolysed and the material placed in a cage and immersed. A current of 500–600 amperes at 20–25 volts will complete the operation in ten to fifteen minutes.—E. F.

Mercerising and Apparatus therefor; Impts. in —. Sir W. Mather, Salford, and J. Hübner and W. J. Pope, Manchester. Eng. Pat. 2993, Feb. 14, 1905.

THE invention is specially applicable to the mercerisation of loose cotton, but may also be used for muslins, laces, yarns, &c. After washing, the cotton is passed in a continuous manner between an upper pervious endless band and a lower travelling bed. The mercerising liquid is forced through the cotton, the latter being stretched between the band and the travelling bed, and thus prevented from contracting. The band and the travelling bed may, one or both, be constructed of wire gauze or of a series of metal bands, and are so devised that a constructive pressure is exerted on the material under treatment. (See also this J., 1905, 272.)—E. F.

Dyestuffs; Manufacture of Blue and Violet to Black — by Oxidation on the Fibre. O. Imray, London. From Farbwerke vorm. Meister, Lucius and Brüning, Höchst a/Maine, Germany. Eng. Pat. 23,193, Oct. 27, 1904.

IN addition to the compounds enumerated in U.S. Pat. 796,715 of 1905 (this J., 1905, 967), *p*-aminohydroxydiphenylamine and *p*-*p*-diaminodiphenylamine may be used on the one hand, and phenol ethers, hydroxycarboxylic acids and their esters, *o*-aminophenol ethers, primary, secondary or tertiary *m*-aminophenols, alkylated or aliphylated *m*-phenylenediamines, naphthylamines, or thioaniline, on the other hand, with or without the addition of tannin or metallic salts.—T. F. B.

Engraving and (or) Etching of Copper Rolls for Calico Printing; Impts. in —. D. C. Paterson, Glasgow. Eng. Pat. 27,222, Dec. 14, 1904.

A HALF-TONE photographic negative is first obtained from the original design. A print is then prepared from this by the bichromate process and is charged with greasy lithographic ink with a roller as used by lithographers. Sufficient ink is taken up by the design to permit of its transference to a lithographic stone. A transfer is then taken off the stone with paper and greasy lithographic ink, and is applied to the surface of a copper roller, which has been previously prepared by coating it with bitumen or some other acid-resisting compound. The greasy ink removes the bituminous coating where it is applied, and the roller is then etched and engraved by the usual methods. The transfer of the design to a lithographic stone may be omitted. In this case a print is prepared from the photographic negative directly on to paper, thin metallic sheeting, or some other flexible support by the bichromate process. The print is then prepared with lithographic ink and applied to the prepared surface of the roller. The same process may also be applied to produce a design on a steel mill, by means of which the copper roller is impressed.—E. F.

Liquids as Brewers' Wash, Sewage, Waste or Spent Dyes and the like; Evaporating —, the Evaporator being also applicable as a Smoke Washer. A. B. Lennox. Eng. Pat. 28,951, Dec. 30, 1904. XVIII., page 1250.

Substances Capable of Resisting Water and Chemical and Similar Influences; Manufacture of — [for Impregnating Textiles, Paper, &c.] C. Kochmann and J. Kaufmann, both of Berlin, Germany. Eng. Pat. 16,744, Aug. 18, 1905.

CARNAUBA wax is heated to a little above its melting

point, and powdered alum is stirred into it, and dissolves in the melted wax "to a fairly considerable extent." The quantity of alum added may vary from 5 per cent. to that necessary for complete saturation of the wax. The mass so obtained may either be cast or moulded, with or without pressure, or else it may be used in the melted state for the impregnation of porous materials, such as paper, textiles, &c. Other substances may be added to the mixture, such as cement, &c., as fillers, or oils to render it soft and flexible. Thus a material, closely resembling vulcanite, is obtained by impregnating a strong cotton or hemp fabric with a mixture of one kilo. of carnauba wax, 300 grms. of calcined alum, 300 grms. of plaster of Paris, and 300 grms. of kieselguhr. A flexible material may be obtained by impregnating with a mixture of 10 parts of carnauba wax, one of "residue of oil of amber," and one of alum. Materials may also be first of all saturated with a concentrated solution of alum, and then treated with the melted wax.—A. G. L.

UNITED STATES PATENTS.

FRENCH PATENTS.

Cellulose and Copper Compounds; Manufacture of Artificial Threads composed of —. A. W. Kracht. Fr. Pat. 355,064, May 1, 1905. Under Int. Conv., March 31, 1905.

A 5–10 PER CENT. cupro-ammoniacal solution of cellulose, containing as little ammonia as possible, is forced, through

apertures of greater diameter than the threads to be produced, into a concentrated solution of sodium carbonate. In this bath, which has a slightly coagulating or conglutinant action, the filaments are drawn out to a great degree of fineness. When sufficiently attenuated and firm, they are passed through a second bath, composed of a 35 per cent. solution of caustic soda or caustic potash, which causes the ammonia in the cellulose-compound to be replaced by soda or potash and renders the filaments considerably more tenacious. The filaments may now be washed with water, treated with acids, &c. and again washed with water, and dried. It is stated that filaments of extreme fineness and great strength are thus obtained.—E. B.

Steaming at High Temperatures [above 110° C.] and with Reduced Volumes of Steam; Process and Apparatus for Continuous —. E. Simon and J. B. Weckerlin. Fr. Pat. 355,081, May 22, 1905.

THE process of steaming, in a continuous manner, printed, padded, or dyed textile materials, at temperatures exceed-

ing 110°C . is claimed. This method has the advantages, it is stated, (a) of effecting more perfect discharges upon cotton, wool, silk and other tissues than are obtained with the same dyestuffs and discharging agents by the usual methods of steaming, and (b) of producing "important" results, possibly with some economy, in the fixation of basic and Alizarin dyestuffs. The azo-Bordeaux colour from α -naphthylamine and β -naphthol, for example, is discharged to a pure white by sodium hydrosulphite-formaldehyde, when tissues dyed with it are steamed for three minutes at a temperature of $130-140^{\circ}\text{C}$. a result which is not attained by steaming for 20 minutes, at

100°C . or a little above this, in the ordinary continuous steaming apparatus.

A form of apparatus, suitable for accomplishing the operation of steaming at temperatures higher than 110°C . which is the subject of a second claim, consists of a heat-insulated double jacketed vessel (see Fig. 2), fitted with a system of rollers, over which the tissues are drawn in the ordinary manner, or, alternatively, and preferably, provided with two sets of rods u , on opposite sides of the vessel, upon which the tissues, &c., are suspended in folds. The tissues, &c., enter and leave the apparatus at its top through a slit s , above which a roller r is mounted. Before beginning the operation of steaming, steam under a pressure of six atmospheres is introduced into the walls X and top of the apparatus, and allowed to circulate therein for 30-35 minutes, or the jacket may be directly heated by means of a fire. The steam is then admitted into the interior of the vessel, the air displaced being allowed to escape through valves t . At the end of a minute, the temperature of the interior will have reached $110-140^{\circ}\text{C}$. whereupon the tissues, &c., to be steamed are passed into the apparatus, and the steaming operation is begun and accomplished in a continuous manner. The comparative rapidity with which the high temperature is attained is to be ascribed to the fact that, owing to the top and walls of the vessel being highly heated, no condensation of steam takes place in the inner space. The steam may now be almost entirely shut off from the outer spaces, being admitted in the necessary quantity to the steaming space, as long as the apparatus is in operation. The excess of steam escapes through the slit s . The dimensions (capacity) of the apparatus described, necessarily small, are considerably less than those of the ordinary small-sized Mather-Platt steaming apparatus. It has not been found possible to obtain high temperatures (of $130-140^{\circ}\text{C}$) with apparatus of large size.

The rods u (Fig. 3), from which the tissues hang down in folds, are actuated from one of the draw-rollers by means of a train of gear-wheels b , upon the last of which a disc c is keyed. The latter bears a pawl p , which, at each revolution of the disc, moves a tappet which actuates a lever and, through it, a ratchet-wheel. The motion of this is communicated by means of cone-gearing to two shafts which turn chain-wheels j , round which pass the chains bearing the rods u . The rods are thus intermittently moved at intervals which are automatically regulated and which correspond with the speed of motion of the draw-rollers, the mechanism being such that the disc completes a revolution whenever a length of tissue sufficient to form a fold, has been fed into the apparatus.—E. B.

Dyeing and Finishing: Method of —. [Action of Chlorine upon Dyestuffs.] C. Henry. Fr. Pat. 355,391, June 20, 1905.

TEXTILE and other materials are simultaneously dyed and finished by the application to them, at the ordinary temperature, of dyestuffs dissolved in varnishes composed of mixtures of (a) gum-lac, colophony, ammonia, and methylated spirit, and (b) an aqueous solution of borax and glue, which may be treated with chlorine or other halogens, introduced into them either in the form of gas or in aqueous solution.—E. B.

CLAIM is made for a machine for the dyeing and seccrage of

skins. [Secrétagé is a treatment with mercuric nitrate solution, for improving the felting properties of the fur or hair.] Above is placed a tank for holding the dye-liquor, &c., which is led to the machine through a small pipe close to the lower end of which is a pipe conveying compressed air. The skins enter and leave the machine by means of rollers. The machine has a perforated bottom for the excess of dye-liquor, &c., to run through, and so be collected. The apparatus is also provided with a draught chimney to carry away obnoxious fumes evolved in the secrétagé process.—W. B. H.

Sponges; Process of Dyeing — T. Asher.
Fr. Pat. 356,176, July 17, 1905.

THE sponges are mordanted, dried at about 50° C., and then dyed in a solution of a suitable dyestuff at about 70° or 80° C. They are finally treated with a hot soap solution, and dried at below 80° C. By using temperatures up to and not exceeding 80° C., it is stated that no contraction of the sponges occurs.—T. F. B.

Fibrous Materials [Leather, &c.]; Producing Designs upon Both Sides of Sheets of — F. W. Moore,
Fr. Pat. 355,265, June 15, 1905. Under Int. Conv.,
Feb. 25, 1905.

SHEETS of leather *a* (see Fig.), or of other suitable, flexible fibrous materials, are ornamented in pattern by passing them over a stationary table *l*, between a guide-roller *e* and a roller *d*, composed of rings or sections, in contact with a matrix-band *k*, of hard material, such as celluloid or metal, against a revolving knife *g*. The band *k*, bears upon it a design in relief and intaglio, or has portions cut out of it, leaving openings in it. As the band *k*, and sheet *a* emerge from between the rollers *e* and *d*, the pressure exerted by the projecting portions of the band upon the upper surface of the flexible sheet, causes parts of the latter to protrude from the lower surface beyond other parts. These protruding parts are cut away by the knife *g*. After the sheet has left the matrix-band, the parts, from which portions have thus been removed, spring back, leaving depressions corresponding with those impressed upon the upper surface. The design is thus simultaneously produced upon both sides of the material.—E. B.

Printing-Machine [for Wall-Papers, &c.]; An Intermittent, Rotary — J. P. Bertrand. Fr. Pat. 350,159, Sept. 5, 1904.

THE object of this invention is to enable sheets of paper to be printed at regular intervals by certain rollers, while they are being, if desired, continuously printed by other rollers. A segment B C (see Figs.) of a crown-wheel of the same length as the circumference of the printing-rollers, is attached to one side of the main crown-wheel A, of a rotary printing-machine. As the wheel A revolves, the segment comes into gear with a crown-wheel or wheels O mounted, in the same plane as it, at the end of the mandrel carrying the intermittent printing-roller or rollers P. A portion, E D (Fig. 3) of the surface of the latter which remains in contact with the paper

Fig 1

Fig 2

Fig 3

as it passes round the bowl T (Figs. 2 and 3), when the roller or rollers P are not in operation, is left unengraved. Springs R engage with the wheels O, to prevent the rollers from being moved out of position by the bowl.—E. B.

VII.—ACIDS, ALKALIS, AND SALTS, AND NON-METALLIC ELEMENTS.

(Continued from page 1172.)

Chromic Acid; Decomposition of — by Hydrogen Peroxide. E. H. Riesefeld. Ber., 1905, 38, 3578—3586.

A KNOWN volume of hydrogen peroxide was slowly run into a large excess of chromic acid (potassium bichromate and sulphuric acid) at the ordinary temperature, the reaction-flask being constantly shaken to avoid local excess of peroxide, and the oxygen evolved was measured. The results showed that the equation $2\text{CrO}_3 + 3\text{H}_2\text{O}_2 = \text{Cr}_2\text{O}_3 + 3\text{H}_2\text{O} + 3\text{O}_2$ represents the reaction. The amount of oxygen actually evolved varied from 2.79 to 2.93 atoms per atom of chromium, the deficiency being, no doubt, due to supersaturation of the liquid. On reversing the conditions of the experiment, and running a known amount of chromic acid solution into an excess (8 to 600 times the theoretical amount) of hydrogen peroxide, the amount of oxygen liberated corresponded to nearly five atoms per atom of chromium, a result which can be represented either by—

or by

To decide which of these reactions really occurs, derivatives of the two perchromic acids, namely K_2CrO_8 and $CrO_4.3NH_3$, were decomposed by acids, in aqueous solution alone and in presence of varying amounts of hydrogen peroxide. In the case of each substance, the amount of oxygen evolved was independent of the presence of hydrogen peroxide. Hence the second set of equations represents the reaction, and chromic acid, in presence of excess of hydrogen peroxide, is converted, chiefly, at least, into a perchromic acid of the formula H_3CrO_8 . The amount of evolved oxygen being always somewhat less than that required by this, it is possible that a less highly oxidised perchromic compound is also formed to some extent. The same reaction occurs in alkaline solution, but if the temperature rises, the alkali salt, when a certain concentration is reached, decomposes according to the equation $2K_2CrO_8 + H_2O = 2K_2CrO_4 + 2KOH + O_2$, regenerating chromate and hydroxide. In this way a given quantity of chromate can decompose an indefinitely large amount of hydrogen peroxide.—J. T. P.

Phosphoric Acid: Equilibrium between some Bases when they are Present Simultaneously with —. A. Quartaroli. *Gaz. chim. ital.*, 1905, 35 [2], 290–304.

THE author states that Berthelot (this J., 1901, 896), probably owing to an error of calculation, wrongly interpreted the results of his experiments on the equilibrium between phosphoric acid, sodium hydroxide and lime or baryta. He has, therefore, determined the conditions of equilibrium in the following systems:— (1) $H_3PO_4 + \frac{1}{2}CaO(or BaO) + 2KOH(or NaOH)$; (2) $H_3PO_4 + \frac{1}{2}CaO(or BaO) + 1NaOH$; (3) $H_3PO_4 + \frac{1}{2}MgO + 2NaOH(or KOH)$; (4) $H_3PO_4 + \frac{1}{2}MgO + 1NaOH(or KOH)$. 25 c.c. of a N/1 solution of phosphoric acid were mixed with corresponding quantities of the alkaline solutions, and the whole made up to 500 c.c. A portion of the solution was filtered immediately, and the filtrate titrated with N/2 hydrochloric acid in presence of methyl orange and of phenolphthalein. After standing for two days, another portion of the solution was filtered and titrated. In system (1) barely one-third of the phosphoric acid present is precipitated, in the form of tri- and tetrabasic salts, and not two-thirds in the form of a double salt $Ca_2(Ba_3)Na_6(PO_4)_4$ as Berthelot stated. Two-thirds of the phosphoric acid remains in solution in the form of tri- and dibasic salts. The bases are distributed irregularly between the precipitate and the solution. If the system $H_3PO_4 + \frac{1}{2}BaO + 2NaOH$ be allowed to stand for a long time, the precipitate ultimately contains one atomic proportion each of sodium and barium, and nearly one-half of the acid is precipitated. In system (2) also, the bases are distributed irregularly between the precipitate and the solution. The latter contains mono- and dibasic phosphates, whilst the precipitate contains di-, tri- and, occasionally, tetrabasic salts. Less than two-thirds of the phosphoric acid is precipitated. Magnesia behaves differently from lime and baryta, and its behaviour depends also on the kind of alkali present. For example, in system (3) when the alkali employed is sodium hydroxide, the precipitate consists solely of magnesium compounds, whilst when potassium hydroxide is used, some alkali is carried down by the precipitate. In system (4), much less phosphoric acid is precipitated (only about one-sixth of the total quantity): apparently a soluble double phosphate is formed, as dimagnesium phosphate is insoluble, and the amount of alkali present would be sufficient for the precipitation of the remaining dissolved magnesium under ordinary conditions.—A. S.

Barium Oxide: A New Hydrate of — [and Presence of Barium Ferrocyanide in the "pure" Hydroxide]. O. Bauer. *Z. anorg. Chem.*, 1905, 47, 401–420.

THE hydrate $Ba(OH)_2.3H_2O$ has been prepared from $Ba(OH)_2.8H_2O$ by melting in an iron crucible and driving off the necessary quantity of water. The boiling temperature slowly rises and finally reaches 108.5 C. as the concentration increases, and at this point heating is discontinued. The cooling process is made to occupy some hours by packing the hot crucible in sawdust, and when some of the product has solidified, the surface crust is

pierced and the rest poured out. When cold the interior is found to contain brilliant rhombic crystals of the new hydrate, which readily absorb carbon dioxide from the air and lose their lustre and transparency. In dry air the trihydrate slowly changes to the monohydrate. The corresponding hydrate of strontium cannot be obtained by a similar method. It is noted that strongly heated barium hydroxide attacks platinum.

When barium hydroxide is obtained by heating the carbonate with charcoal, it is found to contain ferrocyanide. In the heating process barium cyanide is first formed, and this combines with small quantities of iron present to yield Prussian Blue. On solution, barium ferrocyanide results and cannot be removed by recrystallisation but only by heating in steam at 300 C., which decomposes it with the liberation of ammonia and carbon monoxide. Barium oxide prepared by heating the nitrate is not liable to contain this impurity.—E. S. N.

Hypochlorite Production; Relation of Stability to Electrochemical Efficiency in —. W. P. Digby. Paper read before Faraday Soc., Oct. 31, 1905. [Advance Proof.]

IN electrolytic hypochlorite manufacture rarely more than 18 per cent. of the chlorine present in the form of chloride is converted into hypochlorite. The author states that the amount of available chlorine produced from a solution of sodium chloride probably depends upon the relation of the current density to the quantity of unconverted sodium chloride actually present between the electrodes. Consideration is also given to the question of the instability of the electrolytic hypochlorite solutions, and it is shown how important this is in all cases except those in which the sodium chloride solution is fed into the electrolyser at one end and drawn off at the other end for continuous use. It is suggested that the presence of minute quantities of iron in the solution materially affects the instability.—R. S. H.

Nitrous Oxide; Rate of Decomposition of —. M. A. Hunter. *Z. physik. Chem.*, 1905, 53, 441–448.

THE author's experiments were carried out at 700°–900° C., the dried gas being passed through a porcelain bulb, heated in a small electric tube furnace to the desired temperature, which was measured by means of a platinum-rhodium thermo-element. The amount of decomposition was ascertained by determining the density of the effluent gas, after cooling to a definite temperature. The density of the gas was determined in a micro-balance consisting of an ebonite box, in which was mounted a stretched quartz fibre. Mounted across the quartz fibre was a long thread of glass carrying a bulb at one end, whilst the other end travelled over a graduated scale. The results of the experiments show that the reaction is bimolecular, in accordance with the equation: $-2N_2O = 2N_2 + O_2$. Small quantities of the higher oxides of nitrogen are, however, always formed, their amount being greater the higher the temperature. Moisture has little influence on the rate of decomposition.—A. S.

Nitrosyl Fluoride. O. Ruff and K. Stünkel. *Z. anorg. Chem.*, 1905, 47, 190–202.

THE authors report the experiments of Gore (J. Chem. Soc., 1869, 22, 391, 393) on the action of concentrated nitric acid on anhydrous hydrofluoric acid, and on the action of potassium nitrate and sulphuric acid on sodium fluoride, but were unable to obtain a compound of nitrogen, oxygen and fluorine. Nitrosyl fluoride, NOF, was obtained, however, by the action of nitrosyl chloride on silver fluoride. A glass flask containing nitrosyl chloride was connected by means of a glass tube bent at right angles, and by stoppers of paraffin wax with a platinum tube 60 cm. long, and 1 cm. wide, containing dry silver fluoride, and heated to 200–250 C. This tube was connected by means of a stopper of paraffin wax to a platinum bottle or flask provided with two tap-tubes, and connected to a calcium chloride tube. The paraffin wax stoppers in the ends of the platinum tube were protected from the action of heat by means of leaden cooling worms. The flask containing the nitrosyl chloride

was cooled to $-5^{\circ}\text{C}.$; at this temperature, a slow stream of nitrosyl chloride distilled off, and passed over the heated silver fluoride in the platinum tube. The effluent gas was condensed in the platinum bottle by means of liquid air, and was afterwards freed from nitrosyl chloride by repeated fractional distillation. In the pure state in a strongly cooled vessel, it formed a nearly colourless mass, which liquefied at $-134^{\circ}\text{C}.$ and boiled at $-56^{\circ}\text{C}.$ The gas was colourless and had little action on dry glass, but attacked the latter vigorously in presence of moisture. The moist gas also acted strongly on phosphorus pentoxide. Nitrosyl fluoride is decomposed by silicon, boron, phosphorus, antimony and arsenic, and by sodium with formation of sodium fluoride. Tin reacts on warming, and organic substances (starch, caoutchouc, filter-paper) are decomposed with formation of hydrofluoric acid. Nitrosyl fluoride dissolves in water to a blue solution, which decomposes with formation of nitric oxide and nitric acid.—A. S.

ENGLISH PATENTS.

Sulphides of Arsenic; Utilisation of Crude —. F. Howles. London. Eng. Pat. 24,198, Nov. 8, 1904.

CRUDE arsenic sulphides, such, for instance, as result from the de-arsenication of sulphuric acid, are treated with a solution of soda ash (sodium carbonate) or other suitable alkali, and the solution thus obtained is decomposed, preferably hot, by hydrated oxides of iron or manganese, or of other suitable metals. The solution of arsenites thus produced, after filtration from the precipitated sulphides, is evaporated to obtain solid arsenites.—E. S.

Electrolytic Cells; Treating the Contents of —. J. Hargreaves. Eng. Pat. 25,331, Nov. 22, 1904. XI., page 1240.

Nickel and Cobalt; Eliminating Iron from Solutions of —. H. Hirtz. London. Eng. Pat. 28,128, Dec. 22, 1904.

A NEUTRAL or nearly neutral solution of nickel or cobalt, containing iron, is treated with the hydrated peroxide of nickel or of cobalt, as the case may be, added in such proportion that the available oxygen introduced is approximately equivalent to the amount of iron to be oxidised.—E. S.

Carbon; Impts. in Treated —, and Method of Producing same. The British Thomson-Houston Co., London. From General Electric Co., Schenectady, N.Y. Eng. Pat. 28,062, Dec. 21, 1904.

ORDINARY untreated carbon, either moulded into the form of the article to be made or else in block form, is immersed for some time in a bath of melted petroleum jelly, melted paraffin or similar oily substance, or in a heated solution of vaseline, petroleum jelly, lard, oil, &c., in a volatile solvent, e.g., benzine, coal-tar naphtha, or turpentine. No substance which dries or hardens by oxidation should be used, however. In the case of petroleum jelly a temperature of $100^{\circ}\text{C}.$ is used, the carbon being immersed for several hours. The carbon is next usually allowed to drain and dry in the air for several hours. This treatment may, however, be omitted, and the carbon at once baked for several hours in an oven at a temperature at least as high as that at which they are to be used subsequently. Thus dynamo brushes are heated for 12 hours to from 120° to $200^{\circ}\text{C}.$; carbon packing rings for steam turbines are heated for several hours to from 260° to $270^{\circ}\text{C}.$ During this baking a large part of the lubricating material drains out of the carbon.

Kiln for Roasting Fine and Granulated Pyrites; Rotating —. V. Brulfer. Fr. Pat. 355,581, June 24, 1905.

Fig 1

THE kiln or furnace consists of a large cylinder 1 lined with brickwork and refractory material, and rotated by means of a toothed flange on its exterior, gearing with a pinion mounted between rollers (not shown) resting on the blocks 3. The furnace is divided longitudinally into a number of compartments 8, communicating with each other by the passages 9. The two dust-chambers 10 at the ends of the furnace are provided with doors 10' through which they can be cleaned. The pyrites is introduced into chambers 8 through ports 11 from hoppers 12, and the furnace is then set in rotation and heated to bright redness, the pyrites being kept in continual agitation and subjected to a rubbing action by the projections 16 and 17

Fig. 2

(Fig. 2) of refractory material, whereby fresh surfaces are exposed to the air which is admitted in regulated quantities through openings in the wall of the furnace registering with openings in the outer casing, and which passes into chambers 8 through passages 9. The gases produced by the roasting are drawn through the dust-chambers 10 and 18, and led to the Glover tower. The roasted material is withdrawn through ports 11 by means of the draw-plate 13 (Fig. 2).—A. S.

Carbonic Acid; Process and Apparatus for the Solidification of —. H. S. Elworthy. Fr. Pat. 355,503, Jan. 31, 1905.

LIQUEFIED carbon dioxide is solidified in jacketed vessels, which serve as moulds, by the aid of the evaporation and expansion of a part of the liquid, conducted in two phases. The first phase occurs in the outer of two concentric coils, by liberating a portion of the liquid, so as to partially cool the remaining liquid in the inner coil; and the second phase consists in the partial liberation and evaporation of liquid in the jackets to the moulds, whereby the liquid contents of these, already strongly cooled, are solidified. When moulds without jackets are used, they are immersed in a bath of a liquid of very low freezing point, such as alcohol, in which bath a coil receives a current of liquefied ethylene (or of other gas, or of air) cooled by the same means as are applied in the previous cases. The apparatus employed includes a compressor, immersed coils, concentric coils (enclosed in outer coils) for cooling by the system of counter currents, and arrangements for return to the compressor of the gas which is allowed to expand to obtain the cooling effect in the several stages of the process. (Reference is made to Eng. Pat. 25,007, of 1897; this J., 1898, 908.)—E. S.

Ammonia, Cyanogen, and in general, Nitrogenous Compounds; Synthetic Production of — as well as of the simple or complex "Elements" which enter into the Manufacture [of such Compounds]. D. Lance and H. S. Elworthy. Fr. Pat. 355,504, Feb. 22, 1905.

A MIXTURE of methane (marsh gas) and nitrogen, with addition of a considerable proportion of hydrogen, in order to avoid reversal of reaction, is passed over a highly heated inactive porous body, such as pumice, for instance, or over metallic nickel; or the mixture is subjected to electrical energy, in order to produce ammonium cyanide, according to the equation:

This ammonium cyanide then becomes the source of other

nitrogenous compounds. Heated at 80° C. in a closed vessel with sulphuric acid, it gives ammonium sulphate and hydrocyanic acid gas, which is mixed with hydrogen, and passed over finely divided nickel at a suitable temperature, yields ammonia, with recovery of methane, again available for the first mentioned reaction, thus: $\text{CNH} + 6\text{H} = \text{CH}_4 + \text{NH}_3$.

To form an alkali cyanide, potassium cyanide for instance, hydrocyanic acid gas, dried by passing over calcium chloride, is led into a hydrocarbon, only slightly volatile at ordinary temperatures, in a closed vessel in which fused potassium hydroxide is being mechanically crushed and powdered. Potassium cyanide thus formed is freed from the hydrocarbon in a filter press. Other cyanides may be similarly obtained, or ammonium cyanide may be substituted for the acid in the process, in which case ammonia is evolved. To obtain Prussian blue, or similar cyanogen compounds, ammonium cyanide, obtained as described, is passed into water acidulated with hydrochloric acid, and containing ferric chloride.

Ammonium cyanide may, alternatively, be produced by passing a mixture of carbon monoxide, nitrogen and hydrogen over heated nickel, the process being preferably conducted in the apparatus described in Eng. Pat. 12,161, of 1902 (this J., 1903, 990). Apparatus is described whereby the process referred to may be conducted almost automatically.—E. S.

Copper in the Form of Copper Sulphate; Process for the Extraction of — from Barred Pyrites or other Ores of Copper. F. Benker and E. Hartmann. Fr. Pat. 355,584, June 24, 1905.

THE ferrous sulphate contained in liquors obtained by the lixiviation of burnt pyrites or other ores containing copper, with ferric sulphate solution, is oxidised by a current of air in the presence of just sufficient alkali (lime) to cause the precipitation of the iron in the form of basic ferric sulphate. From the filtered solution, the copper is precipitated in the form of basic sulphate by the addition of the necessary quantity of an alkali (milk of lime), the other metals (zinc, manganese, &c.) being left in solution in the form of sulphates. The precipitate is separated, washed, and dissolved in sulphuric acid, and it is claimed that by a single crystallisation, copper sulphate of 98–99 per cent. purity can be obtained.

Alkali Hypochlorites; Electrolytic Apparatus for the Preparation of —. A. Vogelsang. Fr. Pat. 355,656, June 27, 1905. XI.4., page 1241.

Ammoniacal Liquors Resulting from the Manufacture of Lighting Gas; Apparatus for the Distillation of —. J. Adriaanse. Fr. Pat. 355,971, July 7, 1905. III., page 1220.

Brine; Apparatus for the Preparation of — and for the Simultaneous Production of Vapour of High Tension. E. Moll. Fr. Pat. 356,927, July 10, 1905.

BRINE, having, when cold, a density of about 24° B., is continuously pumped into a closed superheater, which is maintained completely full, and has no outlet but through a valved tube, to a closed evaporating vessel with funnel-shaped bottom, placed on a higher level. The flow of brine, thus highly heated under pressure, from the superheater, gives rise in this evaporator to the evolution of steam, stated to attain a pressure of four atmospheres or more, which steam is conducted into a tubular system immersed in a closed brine pan, from which the steam produced is conducted in like manner through other, but open, pans, in which salt of different grains is formed. The evaporator in which the high-pressure steam is stated to be set free, is provided with a manometer, by the indications of which the flow of heated brine from the superheater is regulated by the action of the valve, the flow into and through the superheater being practically continuous. The salt accumulating in the narrow bottom of the evaporator, is discharged from time to time, with drainage liquor, into the closed salt pan mentioned, from the bottom of which a conveyor removes the salt deposited to an elevator and into a draining

receptacle. It is claimed that no back flow of super-saturated brine can take place into the superheater owing to the working of the non-return valve, and hence that danger of saline deposits occurring in the superheater are avoided. (See Eng. Pat. 28,518 of 1903; this J., 1904, 441.)—E. S.

Oxygen and Hydrogen; Electrolysis for Production of —
K. J. Vareilh. Fr. Pat. 355,672, Jun. 27, 1905.

UNITED STATES PATENT.

Glass-Furnace. H. G. Slingluff, Hartford City, Ind.,
U.S.A. U.S. Pat. 804,775, Nov. 14, 1905.

The furnace consists of a glass-melting tank, communicating with a series of drawing-tanks, into which the molten glass flows. Above each drawing tank is arranged an enveloping top or hood, that can be raised or lowered, and is provided with drawing openings, which can be closed when required. When the hood is raised, sections of a flue, attached to it, engage with sections of a flue from the melting-tank on the one hand, and on the other with a draught-stack flue, so that when the glass in the drawing-tank becomes cooled, it can be heated again ("reduced"),

by hot products of combustion drawn through the flue from the melting-tank. Thus the movable hood can be either lowered close to the surface of the glass in the drawing tank, or raised so as to form above the glass in it a heating chamber for the reception and circulation of products of combustion, in order to "reduce" the cold glass at the surface of the mass.—W. C. H.

FRENCH PATENTS.

Quartz-Glass; Method for the Manufacture, at a Relatively Low Temperature of a Composition of — Free from Air-bubbles. J. Bredel. Fr. Pat. 355,791, July 1, 1905.

THE quartz or other material to be fused is first heated in a current of hydrogen at a temperature of about 1200° C., at which it is permeable by hydrogen. The latter combines with the oxygen of the air in the interstices of the material, the resulting steam largely expelling the residual nitrogen. The current of hydrogen is then stopped, and the material immediately exposed to the action of an oxyhydrogen blow-pipe flame rich in oxygen, whereby the combustion of the hydrogen in the interior of the material is continued, and a liquid mass free from air-bubbles obtained at the relatively low temperature of 1950–2000° C.—A. G. L.

Glass; Continuous Electric Furnace for Production of — and Other Products. V. M. Sauvageon. Fr. Pat. 355,824, July 3, 1905.

THIS is a furnace in which the heat is generated by the resistance which molten glass offers to the passage of the electric current. Several compartments are provided for the various stages of the manufacture, the cross-sections and lengths of which vary in accordance with the particular work to be performed so as to supply the requisite heating. In the figures, I. and VI. form the electrode chambers in which the current density is low, so as to avoid a high temperature and consequent corrosion of the carbons. Section II. is the fusion chamber proper having a very reduced section, and therefore considerable development of heat. Compartment III. is for refining, and IV. is a settling chamber. The glass is withdrawn for working at V.—R. S. II.

Glass-Furnace; Regenerative — for Gas. C. Deselle. Fr. Pat. 355,874, July 4, 1905.

THE waste heat of the products of combustion is utilised in this furnace in pre-heating the air. This is done by superimposing two arches above the roof of the furnace-chamber proper, thus forming two hollow spaces above the latter; through the outer one the burnt gases find their way into the chimney, whilst the air needed for combustion has to pass through the inner one, which is heated both by the waste gases and the furnace itself. Below the furnace-chamber are arranged a number of hollow spaces in the form of sectors of a circle; the waste gases have to pass through one alternate set of these chambers before entering the above-mentioned hollow space above the roof of the furnace, whilst the air traverses the other set of chambers after passing through the inner space above the roof.

UNITED STATES PATENTS.

Stone from Magnesite; Making Artificial—. M. Gerster, Assignor to H. Freund und Söhne Budapest, Austria-Hungary. U.S. Pat. 803,479, Oct. 31, 1905.

SEE Eng. Pat. 27,857 of 1904; this J., 1905, 240.—T. F. B.

Wood; Process of Producing Liquid-tight Joints for Impregnating—. G. Kron, Copenhagen. U.S. Pat. 803,603, Nov. 7, 1905.

SEE Fr. Pat. 346,723 of 1904; this J., 1905, 241.—T. F. B.

Wood; Process of Saturating [Preserving]—. W. C. Jones, W. R. J. Stratford, F. B. Byrnes, and E. J. Nixon, Texarkana, Tex., Assignors to The International Creosoting and Construction Co., Galveston, Tex. U.S. Pat. 804,132, Nov. 7, 1905.

THE sap and other liquid substances in the wood are vaporised and drawn off, and the wood contained under a vacuum until thoroughly dried. It is then saturated, under pressure, with a chemical preservative, the surplus preservative is drawn off, and the wood subjected to a high pressure of air, which is maintained until the preservative has thoroughly penetrated all portions of the wood.

—W. C. H.

Clays; Method of Revivifying Spent—. A. B. Lattin, Memphis, Tenn. U.S. Pat. 804,046, Nov. 7, 1905.

By this process, spent clays are pulverised, and heated in contact with a flame, hot air being forced through the clays at the same time. The organic impurities are burned out and the oxygen forced through, for the purpose it is said, "of restoring the active qualities of the clays."

—W. C. H.

Cement; Furnace for Burning—. G. Gröndal, Djursholm, Sweden. U.S. Pat. 803,530, Oct. 31, 1905.

SEE Fr. Pat. 341,382 of 1904; this J., 1904, 867.—T. F. B.

FRENCH PATENTS.

Veinings in One or More Colours; Process for Obtaining — on all Kinds of Objects or Solid Materials. J. M. J. Truchelut. Fr. Pat. 350,194, Sept. 27, 1904.

COLORING matters of all kinds are mixed with a sticky liquid, which is then spread in a very thin layer on the surface of another immiscible and heavier liquid. By agitating the surface, coloured veins, &c., are obtained, which are then transferred to the object to be decorated (which may be of most varied kind) by applying it to the surface of the heavy liquid. A suitable composition with which the colours may be mixed consists of: Oil of turpentine, 100 grms.; colophony, 10 grms.; linseed oil, 10 grms. "siccatif soleil," 5 grms. The heavy liquid may be water, mercury, &c.; and any colours, organic or mineral, may be used. Claim is also made for new industrial products and effects.—A. G. L.

Bricks from Pitch and Coal Tar. A. Monicole and M. Dupont. Fr. Pat. 355,901, Jan. 10, 1905.

POWDERED coke and sea-sand are gently heated in a suitable vessel, and 20 per cent. of pitch and 10 per cent. of coal tar added with stirring. The pasty mass obtained is then moulded under pressure. The product obtained may be employed alone, or together with a framework of iron, or with hydraulic lime or cement.—A. G. L.

Fibres, Films, Blocks or Plates; Transparent Plastic Product for the Manufacture of—. H. C. M. L. Cathelineau and A. A. R. Fleury. Addition, dated June 8, 1905, to Fr. Pat. 354,942, June 5, 1905. V., page 1226.

Building Material from Blast-Furnace Slag, Possessing the Properties of Trass and similar Products; Process of Making—. H. Colloseus. Fr. Pat. 356,146, July 12, 1905.

SEE Eng. Pat. 13,886 of 1905; this J., 1905, 971.—T. F. B.

GERMAN PATENTS.

Asbestos Objects from finely-divided Asbestos; Preparation of — without the use of Binding Agents. J. Bernfeld. Ger. Pat. 160,981, April 19, 1904. Addition to Ger. Pat. 148,936, June 12, 1901. (Compare this J., 1905, 444.)

In order to render the objects resistant to acids, they are impregnated with a warm or hot solution of water-glass (alkali silicate), from which silicic acid is separated subsequently by known means.—A. S.

Stone; Process for the Preparation of Porous Artificial — and of other Porous Bodies. H. Schmidt. Ger. Pat. 161,641, May 10, 1904.

THE mass used for the preparation of the artificial stone is mixed with pieces of ice, the amount of ice added varying with the degree of porosity desired. The mixture is then formed into the required shapes.—A. S.

X.—METALLURGY.

(Continued from page 1178.)

Coke: Properties of Good Blast-Furnace ——. Weill. Bull. Soc. d'Encourag., 1905, 107; Rev. de Metall., 557—566

Hardness.—A good coke must be hard, to minimise the waste by breakage. The smalls on drawing the coke may be taken at $2\frac{1}{2}$ per cent.—say, 1 per cent. of 2 cm. fragments and $1\frac{1}{2}$ per cent. of dust. When the coke goes direct into trucks and is thence discharged into receptacles at the furnaces, 4 per cent. may be estimated as breakage: but if it goes from the trucks into lighters, thence into a steamer, whence it must be again discharged into lighters and trucks before reaching its destination, the waste may amount to 10 or even 20 per cent. Assuming a breakage of 4 per cent., and taking the price of the coke delivered at the furnaces as 25 fr., and the value of the smalls as 3 fr. per ton, the cost of the breakage, in a furnace using 150 tons daily, amounts to 134 fr. per day. Still greater loss occurs through breakage of the coke in the furnace itself, for not only do the "smalls" favour the formation of stoppages in the furnace, but by exposing greater surface to the ascending gases it is more readily reacted on by the carbon dioxide and carried off as monoxide. The breakage cannot be due to actual crushing stress, for in a furnace 20m. high, using per ton of pig-iron, 1800 kilos. of ore, 500 of flux, and 1200 of coke, assuming the weights in kilos. per cb. m. to be 1800, 1400 and 450, the burden of the 20m. column would be 1.70 kilos. per sq. cm., while the resistance of coke to crushing pressure is given by Rossigneux and by Simmersbach as 60 to 175 kilos. per sq. cm. The breakage is no doubt due to the successive shocks and slides during the passage of the charge down the furnace, which, of course, is not continuous but intermittent. The comparison of cokes in this respect can be roughly effected by placing a sufficient quantity in a cylinder or drum of considerable diameter, which is then rotated on a horizontal axis (say, 400 kilos. of coke in a cylinder 2m. diameter and 60 cm. long, rotated for fifteen minutes at 10 revolutions per minute), and grading and weighing the *d'bris*. The cost can then, of course, be estimated by assuming values for the different grades of "smalls."

Porosity.—Coke is usually porous enough to burn rapidly in the furnace. Compared with charcoal, it is much more coarsely porous, though the total volume of its pores is less. The following figures indicate this:—

	Total volume of 100 grms. c.c.	Volume of sub- stance, c.c.	Volume of pores, c.c.
Gas coke (Osnabrück)	116.4	54.8	61.6
Coke from compressed coal (Mor- gensonue)	101.6	54.0	47.6
Coke from Neu Iserlohn	114.4	54.0	60.4
Wood charcoal, pine	262.0	61.6	200.4
" beech	168.4	67.6	100.8
" birch	206.5	74.0	132.5

Wood charcoal burns in air at roughly twice the rate of coke or anthracite, and when heated in a stream of carbon dioxide, at twelve times the rate of coke. This great facility of reaction with carbon dioxide forms a disadvantage to wood charcoal, and the good results formerly obtained with this fuel are, no doubt, due to the rapidity of its action, allowing the use of rich and easily reducible ores, rather than to its mere porosity; with modern conditions of temperature and pressure of blast, equally favourable results are obtainable with coke, and furnace managers are directing their efforts towards obtaining denser rather than more porous cokes. A diminution of 20 per cent. in the volume of the coke means (assuming the volume of coke to be half the total volume of the charge) an effective increase of 10 per cent. in the capacity of the furnace. The connection between hardness and porosity has not been worked out; the nature of the pores

depends, no doubt, both on the nature of the coal and the conditions of the coking, but it is quite certain that a very dense coke may yet be less hard than another coke which is much more porous. The ash, according as it is low or high, and still more according as it is fusible and uniformly distributed and thus binding, or infusible and existing in pockets or bands and thus disintegrating, also influences greatly the effective hardness of the coke.

Ash.—Suppose a furnace uses daily 150 tons of coke, containing 10 per cent. of ash, containing, say, 55 per cent. of silica, and 30 per cent. of alumina. To flux this 15 tons of ash will require 13 tons of lime or 23 tons of limestone, and there will be formed about 28 tons of slag and 10 tons of carbon dioxide. From Osann's figures, there will be needed to fuse the slag 4.48, to expel the carbon dioxide 2.90, in all 7.38 tons of carbon, or 8.6 tons of coke. The cost of materials will be for limestone (3 fr. per ton) 69, for coke (25 fr. per ton) 215, total 284 fr. Taking 10 per cent. as the normal ash, then each 1 per cent. additional means a daily cost of 28 fr. for flux and fuel, and 43 fr. because $1\frac{1}{2}$ tons of ash are being paid for as $1\frac{1}{2}$ tons of carbon at 29 fr. per ton, in all 71 fr. Moreover, the additional carbon dioxide produced dilutes the furnace-gases, and lowers the steam production and the temperature of the blast, which means more coke in the furnace and more coal in the boilers. Not counting this, it seems that 1 per cent. extra ash means a lessened value of 71/150 or 0.45 fr. per ton of coke, or of 0.30 fr. per ton of the coal used to produce it.

Water.—This proceeds, of course, from the quenching of the coke, and may vary enormously according to the care with which this is done. Good Newcastle coke has not more than $1\frac{1}{2}$ per cent. of water, but contents of 4, 6 and even 8 per cent. are often met with. Assuming 0.2 kilo. of carbon to drive off 1 kilo. of water, 150 tons of coke containing 4 per cent. of water will need for this purpose 1.2 tons of carbon, or 1.4 tons of coke. Thus, if 4 per cent. be the normal water-content, each 1 per cent. extra will cost daily 8.75 fr. (0.35 ton of coke) for extra coke, and 43.5 fr. for water bought as carbon (1.5 tons), in all 52 fr.; or each 1 per cent. of extra water lowers the value of the coke by 52/150 or 0.35 fr. per ton.

Sulphur.—German (Ruhr), Cardiff and Newcastle cokes contain 0.8 to 1.5. Northern French and Belgian cokes 0.5. Russian cokes 3.0 to 3.5 per cent. of sulphur. Suppose 1 per cent. as the normal amount. To convert this into calcium sulphide needs (on 150 tons) 3.30 tons of limestone, containing 1.43 tons of carbon dioxide; this requires for fusion 0.54, for expulsion of carbon dioxide 0.41 ton of carbon, in all, say, 1.1 tons of coke. The cost is for flux 9.9, for fuel 27.5, in all 37.4 fr.; so that an extra 0.5 per cent. of sulphur costs 18 fr. per day, or reduces the value of the coke by 0.12 fr. per ton. This is not the only disadvantage of sulphur, however, for the slag will only contain a certain proportion—a proportion which varies enormously with the proportions of the other constituents of the slag, and which can only be found by trial in each case. If the amount of sulphur in the coke increases so that the slag is more than saturated, then the materials to produce an extra amount of slag per ton of pig must be added and dealt with.

Phosphorus.—Newcastle cokes contain about 0.012 per cent. of phosphorus, French from 0.022 to 0.07, Cardiff 0.022 to 0.05, Ruhr 0.022 to 0.035. To obtain, with 50 per cent. ores, pig-iron containing below 0.06 per cent. of phosphorus, the ores must not contain above 0.02 per cent., unless the coke contains less than this. For special purposes, certain cokes are excluded by the amount of phosphorus they contain.

Alkali Chlorides.—These are contained in the ash of most cokes. They are without influence on the production of pig-iron, but have without doubt much to do with the wear and tear of the furnace. They react on the lining, where a certain temperature exists, to produce readily fusible silicates, and hence arises considerable corrosion at these parts, which can only be lessened by employing very dense and compact bricks, or by using water to cool the lining. Where the only water available for quenching the coke is briny, the amount of alkali chloride carried by the coke may be enough to produce serious damage in this way.—J. T. D.

Manganese Silicide; Preparation of —, by Reduction with Aluminium. E. Vigouroux. *Comptes rend.*, 1905, 141, 722—724.

THE compound SiMn_2 has been obtained in the pure crystalline condition by reducing a mixture of silica and the brown or red oxide of manganese with aluminium. The silica was specially prepared from silicon chloride, and the oxide of manganese by calcination of the dioxide, itself prepared from potassium permanganate, and the aluminium filings were carefully freed from iron by a magnet. In one experiment the quantities taken were 120 grms. of silica, 300 grms. of manganese dioxide, and 150 grms. of aluminium; but the same compound resulted when other proportions were used.

In carrying out the process a crucible lined with compressed magnesia contains the charge, and a mixture of manganese dioxide and aluminium is used as priming. The reaction is accompanied by the evolution of great heat, which melts the product. The impure substance, freed from slag, is readily powdered, and after prolonged digestion with hydrochloric acid (of 2 per cent. strength), small crystals may be obtained from which accompanying silica is washed by water acidulated with hydrofluoric acid. They then correspond to the formula given above. The substance is attacked by hydrochloric or nitric acid with the formation of silica.—F. SOX.

Blast-Furnace; Notes on the Physical Action of the —. J. E. Johnson, jun. *Bull. Amer. Inst. Mining Eng.* 1905, 1111—1145.

STARTING from theoretical considerations, the author shows that the fuel-consumption of blast-furnaces is capable of further reduction. He then discusses in detail certain problems of importance in blast-furnace practice, namely: the pressure of the blast; the descent of the charge, and the origin and nature of "slips," as affected by the blast-pressure; and the effect of heating and of drying the blast.—A. S.

Iron; Rusting of —. W. R. Dunstan, H. A. D. Jowett and E. Goulding. *Chem. Soc. Trans.*, 1905, 87, 1548—1574.

A DETAILED account of the experimental evidence and the reasoning leading to the conclusions already given in this J., 1903, 745. The work is treated under the following headings:—Action of dry and moist gases on iron; action of oxygen and liquid water on iron; action of water alone on iron; effect of salts and other substances on the process of rusting; formation of hydrogen peroxide during the oxidation of metals; aerial oxidation or rusting of metals in general; the general theory of rusting; composition of iron rust; the reaction between iron and water at high temperatures; the influence of carbon dioxide on rusting; formation of rust by electrolytic action.—A. S.

Iron; Dunstan, Jowett, and Goulding's Paper on the Rusting of —. E. Divers. *Chem. Soc. Proc.*, 1905, 21, 251—253.

THE fact which throws into the background all others contained in the important paper by Dunstan, Jowett, and Goulding on the rusting of iron (*Chem. Soc. Trans.*, 1905, 87, 1548, see preceding abstract, also this J., 1903, 745), and, indeed, constitutes its substance, is that even the purest available iron is freely rusted by oxygen and liquid water, unaided by carbon dioxide or any other substance. Yet, in the construction of the paper, this fact seems to have been subordinated, perhaps without intention, to the setting forth of, and submitting evidence for the theory that the rusting of iron is a process involving the formation of hydrogen peroxide. Accordingly, the publication of a preliminary abstract of the contents of the full paper led Moody (this J., 1903, 745) to suppose Dunstan's contention to be that ordinary rusting is caused by hydrogen peroxide. There is, therefore, reason to fear that those chemists who may hesitate to accept the hydrogen peroxide theory will be apt to overlook the fact that whether with or without the intervention of hydrogen peroxide, iron rusts when in contact with nothing more than an aqueous solution of oxygen.

Now the truth of the authors' theory to explain the

fact may well be doubted, although they themselves hold that they have obtained a considerable body of experimental evidence in favour of the temporary formation of hydrogen peroxide. For, in support of the theory, no other fact is to be found in the paper than that the alkalis and other substances, which interfere with the existence of hydrogen peroxide, likewise prevent the rusting of iron. But the coincidence here observed is fully and accurately accounted for, without dependence on hydrogen peroxide, as being the result of the inability of oxygen and water in presence of one of these substances to act together as *hydroxyl*, whether it be to form hydrogen peroxide, $(\text{HO})_2$, or such a compound as zinc hydroxide, $\text{Zn}(\text{HO})_2$. Hydrogen peroxide is not wanted in order to explain the rusting of iron; indeed its production stands rather in the way of a simple theory. What is wanted is the presentation of free or at least available hydroxyl groups to unite with the iron. Again, it is hardly a tenable argument that a substance, because it interferes with the existence of another substance, must likewise prevent its formation. For instance, ferrous sulphate ends the existence of free chlorine, but it does not prevent manganese dioxide and hydrochloric acid in contact with it producing the atomic chlorine, which it immediately proceeds to consume.

Moritz Traube explained and experimentally illustrated what he called the "autoxidation" of metals and other substances as being the chemical intervention of the water molecule between that of the autoxidising substance and that of the oxygen. Water, which cannot be acted on by either alone, is capable of chemical partition between the two: with zinc present to seize the hydroxyl of the water, the oxygen can take the rest of its hydrogen to form hydrogen peroxide, and, accordingly, this substance is not an uncommon product of autoxidation. It is easy and natural to admit that, with the great evolution of energy in the union of zinc with hydroxyl, only the small addition of energy afforded by the hydrogenation of free oxygen into hydrogen peroxide should be sufficient to half dehydrogenate the oxygen of water. Traube's equation satisfactorily represents, therefore, the formation of the hydrogen peroxide. The authors, however, give equations which are indistinguishable from those suggested by Hoppe-Seyler, although they very rightly reject this physiological chemist's conception of the nature of oxidation. They write (*loc. cit.*, page 1549) $\text{Fe} + \text{O}_2 + \text{H}_2\text{O} = \text{FeO} + \text{H}_2\text{O}_2$ [Traube would have written it $\text{Fe} + 2\text{OH} \cdot \text{H} + \text{O}_2 = \text{Fe}(\text{OH})_2 + \text{H}_2\text{O}_2$]. Again, they write $\text{Fe} + \text{OH}_2 = \text{FeO} + \text{H}_2$; $\text{H}_2 + \text{O}_2 = \text{H}_2\text{O}_2$, equations which have none of the acceptability of Traube's. Can it be admitted that iron may do what potassium cannot do, displace all the hydrogen of water? Can it be allowed by the laws of thermal chemistry that cold water can be endothermically oxidised into hydrogen peroxide? There is another equation, given to explain the action of hydrogen peroxide on iron, to which also exception must be taken: $\text{Fe} + \text{H}_2\text{O}_2 = \text{FeO} + \text{H}_2\text{O}$. Surely if the equation holds good at all, the right side of it should be written $\text{Fe}(\text{OH})_2$, the hydroxyls uniting with the iron, even if, afterwards, water separates.

The conversion of iron into rust seems to be as fully explained and as simply displayed as the facts allow by the following equation: $(\text{O}_2 + 2\text{H} \cdot \text{HO}) + 4\text{Fe} + 2\text{O}_2 = 4\text{HO} \cdot \text{Fe} : \text{O}$. or, if preferred, $2(\text{HO})_2\text{Fe}_2\text{O}_2$. If it is proper, as it apparently may be, to represent the ferrous and the ferric oxidation as distinct, then the above equation may be resolved into $(\text{O}_2 + 2\text{H} \cdot \text{HO}) + 4\text{Fe} + \text{O}_2 = 2(\text{HO} \cdot \text{Fe}')_2\text{O}$ (ferrous oxyhydroxide) and $2(\text{HO} \cdot \text{Fe}'')_2\text{O} + \text{O}_2 = 4\text{HO} \cdot \text{Fe}''\text{O}$. Putting these equations into words, rusting consists in the oxidation of iron by oxygen, with the intervention of water as hydroxyl hydride to the extent of 2 * mols. for every 3 mols. of oxygen consumed. To account for the non-formation of hydrogen peroxide nothing need be advanced; that seems to come as a matter of course. The point to be explained is, rather, the very production of this substance during the autoxidation of zinc and other substances. Why do not all the hydroxyls combine with the zinc, instead of a very small

* Instead of the 6 mols. of water required by Traube's equation in the theoretical production of $\text{Fe}_2(\text{OH})_6$.

FIG. 1.

FIG. 2.

FIG. 3.

an ingot of native gold, for instance, containing up to 200 of silver per 1,000, shows clearly by the colour of the cross-section, how the gold accumulates towards the centre and the silver towards the outside. The author considers that in these cases, as also in the Pattinson process for desilvering lead, and similar instances, the effect is due to a differential "thermo-potential" between the iron of the mould or melting-pot and the metals of the alloy.—J. T. D.

Magnetic Alloys; Heusler's —. B. V. Hill. Phys. Review, Nov. 1905; through Electrician, 1905, 56, 225.

HEUSLER'S magnetic alloys composed of non-magnetic metals (see this J., 1905, 850) show an irreversibility with regard to high temperatures, similar to that exhibited by nickel steels with respect to low temperatures. An alloy containing 60 per cent. of copper, 25 per cent. of manganese and 15 per cent. of aluminium lost its magnetism permanently when heated to 950° C., and became perceptibly lighter. (Nickel steels are heavier in the non-magnetic condition.) Another alloy containing more aluminium than the one just mentioned, was subjected to repeated heating and cooling. Starting with an intensity of magnetisation of 311 units, the magnetism had completely disappeared at 320° C., whilst, after cooling, the magnetisation was 267 units. On again heating, the intensity of magnetisation fell to 7 units at 500° C., and then rose to 27 units on cooling to the ordinary temperature, and to 36 units at the temperature of liquid air. By heating to bright redness, the magnetisation increased to 155 units and to 165 units on subsequent cooling in liquid air.—A. S.

Alloys; Copper-Aluminium —. L. Guillet. Bull. Soc. d'Encourag., 1905, 107, Rev. de Metall., 567—388.

THE results of the thermal and micrographic study of these alloys already recapitulated (this J., 1905, 1019) are given in greater detail, with photomicrographs, showing the structure of the alloys.

The alloys used industrially are those with less than 11 and with more than 94 per cent. of aluminium. The former (aluminium bronzes) consist of the solution α or of the solution α with the constituent β . This constituent, however, renders the alloy hard and brittle; hence, alloys containing more than 11 per cent. of aluminium are not used. No industrial alloy contains the compound AlCu , which renders the alloy extremely brittle. The compound Al_2Cu has the same tendency; and the industrial alloys at the aluminium end of the series all consist of aluminium with but small proportions of the eutectic $\text{Al—Al}_2\text{Cu}$. This cementing eutectic is hard, and assists in the working of the metal. Of alloys high in aluminium, however, those with iron and manganese (which seem to form solid solutions) are more used industrially than those with copper. The similar alloys

with nickel consist of aluminium surrounded by the eutectic $\text{Al—Al}_2\text{Ni}$, and decompose water readily. A number of results of mechanical tests of aluminium-copper alloys are given in the paper.—J. T. D.

Zinc-Cadmium Alloys [containing Lead]; Properties of —. F. Novak. Z. anorg. Chem., 1905, 47, 421—445.

THE author has investigated the effects of alloying ordinary zinc containing lead, along with small quantities of cadmium, as bearing on its suitability for use in process-engraving.

Zinc alloyed with 0.5—1 per cent. of cadmium, and rolled into sheets at 120° C., has a lower speed of reaction with dilute hydrochloric acid than the original zinc, but with dilute nitric acid a higher speed. After recrystallisation by heating at 270° C., the original zinc or its cadmium alloy has a higher speed of reaction with dilute nitric acid than when merely rolled at 120° C. Increasing the percentage of lead up to its saturation point (2 per cent.) has no effect on the speed of reaction with this acid. Zinc alloyed with 0.25 per cent. of cadmium, possesses, after rolling, and recrystallisation by strongly heating, a more finely-grained structure than zinc which is free from cadmium. Its hardness and tenacity are moreover increased, and its brittleness diminished, but above 0.5 per cent. of cadmium has the reverse effect and influences the quality of the metal unfavourably.—F. SDX.

Metals; Influence of Phase Changes on the Tenacity of Ductile —, at the ordinary Temperature and at the Boiling-point of Liquid Air. G. T. and H. N. Beilby. British Assoc., South Africa, 1905, Section B.; Chem. News, 1905, 92, 220. (See also this J., 1904, 788.)

THE crystalline (C) phase of ductile metals is the mechanically unstable, the amorphous (A) the mechanically stable phase. Annealed wires, in the C phase, stretch before breaking when stressed beyond the yield point; hardened wires, in the A phase, break without extension. During the stretching of annealed wires, they partly change into the A phase, but never completely, and their tenacity approximates towards, but never rises to, the tenacity of the metal in the A phase. The authors have measured the tenacity of wires which had been as nearly as possible converted into the A phase by drawing at the ordinary temperature; and the figures recorded are higher than any previous records for equally pure metals. The gold had a purity of 9997 per 10,000, the silver of 10,000 per 10,000, and the copper a conductivity of 100 per cent. The tenacities were, in tons per sq. in., for

	At 288° Abs.	At 93° Abs.
Gold	15.6	22.4
Silver	25.7	34.4
Copper	25.4	36.0

The wires broken at the ordinary temperature showed no stretching; but at the boiling point of liquid air, all stretched (uniformly over the whole length between the grips) from 11 to 12 per cent. The fractured ends of the copper wires all showed a cupped formation, apparently due to the presence of gas-bubbles which the drawing had stretched out into tubes. The silver wire ends occasionally showed the same formation, but the fractures of the gold wires were almost perfectly viscous.—J. T. D.

ENGLISH PATENTS.

Separating Certain Constituents of Finely Divided Material; Process for — by Flotation. F. E. Elmore, London. Eng. Pat. 17,816, Aug. 16, 1904.

THE pulp having been mixed with tar, oil, or other liquid, alone or in conjunction with alkalis, acids, air, or gas, or having had a gas generated within the mixture electrolytically or otherwise, a partial vacuum is produced within the separating chamber, whereby a smaller proportion of added substance is rendered sufficient to effect the desired separation.—J. H. C.

Ores; Apparatus for Separating Certain Constituents of — by Flotation. A. J. F. de Baray, Kew, Victoria, Australia. Eng. Pat. 25,858, Nov. 28, 1904.

THE suitably prepared ore-pulp is fed from a cistern by means of an adjustable rotary feed contrivance in a thin sheet or film on to an inclined table, the angle of which may be varied, and is there spread by tags or brushes. The lower edge of the table dips into a well or trough of water having an adjustable lip or overflow for the removal of the floating particles. An endless travelling belt supported on suitable rollers works in the said trough, and carries off the non-flotable particles for re-treatment on a similar table. Water sprays are provided for the tables, and belts as may be required.—J. H. C.

[“*Flotation Process*” for Broken Hill Ores] *Processes for Separating Certain Constituents of Finely Divided Material by Causing them to Rise or Float in a Liquid.* A. S. Elmore, London. Eng. Pat. 5953, March 21, 1905.

THE “flotation” (i.e., separation of ore particles from gangue) is effected by a liquid consisting of an aqueous solution of one or more chlorides and hydrochloric acid. Thus “zinc middlings” are treated with a solution of calcium chloride at 32° B. containing 0.1 per cent. of free hydrochloric acid at a temperature of 100° to 120° F. —A. G. L.

Ore Concentrators; Impts. in —. E. Deister, Fort Wayne, U.S.A. Eng. Pat. 4052, Feb. 27, 1905.

SEE FR. PAT. 354,549 OF 1905; THIS J., 1905, 1114.—T. F. B.

Furnaces; Impts. in [Muffle] —. T. G. Blundell, London. Eng. Pat. 25,507, Nov. 23, 1904.

THE claim is for the introduction of a bridge or baffle-plate between the combustion chamber and the muffle or crucible chamber of the furnace. The baffle plate has sloping surfaces and ports or apertures which deflect the flames in such a way that they do not impinge directly upon the muffle or crucible, but rather upon the furnace walls.—W. H. C.

Furnaces; Impts. in or relating to Crucible Steel Smelting — and the like. R. Lindemann, Osabrück, Germany. Eng. Pat. 26,093, Nov. 30, 1904.

THE object of the invention is to obtain a very high temperature in a crucible furnace in a very short time, and to utilise as much as possible of the waste heat. To this end the roof of the furnace chamber proper is double-walled, and, by means of specially arranged horizontal partitions between, air introduced under pressure from above is forced to pass along a zig-zag course to the underside of the grate, where it rises to the crucibles through the fuel, and then passes into an open-hearth furnace attached to the crucible furnace proper, the open-hearth furnace being used for metals requiring a lower temperature than steel, e.g., cast iron.—A. G. L.

Moisture from the Air; Apparatus for Removing — more especially intended for Treating Air for Supply to Blast Furnaces, Converters and the like. E. Hesketh, London and H. Brier, Dartford, Kent. Eng. Pat. 27,498, Dec. 15, 1904.

A SERIES of refrigerating chambers are connected with heat interchangers by means of diverting valves so that a counter current interchange of temperature is maintained between the inflowing current of warm air and the

outflowing current of cooled air. This allows the melting of the snow formed on the pipes of the refrigerators to be performed in an economical manner at the expense of the inflowing warm air.—W. H. C.

Bronze; Manufacture of —. A. Jacobsen, Hamburg, Germany. Eng. Pat. 25,882, Nov. 28, 1904.

SEE FR. PAT. 353,999 OF 1905; THIS J., 1905, 1071.—T. F. B.

UNITED STATES PATENTS.

Furnace; Metallurgical —. H. H. Goodsell, Leechburg, Pa. U.S. Pat. 803,337, Oct. 31, 1905.

THE furnace consists essentially of a heating chamber, a pan containing a suitable liquid, and a “bluing” chamber. By means of a by-pass the gases of combustion from the heating chamber can be cut off from the pan and caused to pass to the “bluing” chamber. Means are provided for heating the “bluing” chamber by steam without materially heating the liquid contained in the pan, and also for supplying air to the pan in order to cool it. The metal plates under treatment are passed through the “bluing” chamber over a set of horizontal rollers, and through the pan over rollers disposed in the form of an arc of a circle. Below the rollers in the pan is a perforated baffle-plate also in the form of an arc of a circle.—A. S.

Furnace for Smelting Ore. R. Baggaley, Pittsburg, Pa. U.S. Pat. 803,737, Nov. 7, 1905.

THE invention relates to a matte-furnace having converting tuyères near the bottom and smelting tuyères at a higher level, with a slag outlet between the two sets of tuyères. Air under pressure is supplied both to the converting tuyères and to the smelting-tuyères; the former discharge into a clean body of molten matte, whilst the air from the latter acts on a charge floating on the matte. A burner is provided for supplying heat above the smelting-tuyères.—A. S.

Blast-Furnace Flue Dust; Process of Utilising —. S. B. Sheldon, Buffalo, N.Y. U.S. Pat. 803,792, Nov. 7, 1905.

THE flue-dust from a blast-furnace is mixed with a quantity of coal equal to that which had been consumed in the furnace during the period in which the flue-dust was produced, and the mixture is coked. According to one claim, the proportion of flue-dust in the mixture is specified as from 3 to 5 per cent. of the weight of the coal.—A. S.

Zinc; Extraction and Purification of —. A. V. Cunningham, Winnington. U.S. Pat. 803,472, Oct. 31, 1905.

SEE Eng. Pat. 4706 of 1904; THIS J., 1904, 1220.—T. F. B.

Zinc Alloys; Process of Making —. P. and A. Gührs, Berlin. U.S. Pat. 804,006, Nov. 7, 1905.

SEE FR. PAT. 332,657 OF 1903, and Addition thereto; THIS J., 1903, 1247; and 1904, 191.—T. F. B.

Iron Ores; Treatment of —. C. Ellis, New York. U.S. Pat. 803,886, Nov. 7, 1905.

THE process claimed is for the manufacture of metallic iron, and consists in subjecting a moving stream of finely-divided iron ore mixed with a flux, to the action of a high-temperature flame, a stratum of a reducing gas, such as producer gas, being interposed between the high-temperature flame and the stream of ore.—A. S.

Alloy. F. W. Moffett, Assignor to H. M. Thomas, Bloomfield, N.J. U.S. Pat. 803,921, Nov. 7, 1905.

CLAIM is made for an alloy containing lead and sodium, the amount of the latter metal being from 0.5 to 4 per cent. of the weight of the lead; and also for an antifriction-bearing metal, composed of lead alloyed with 1.5 per cent. of its weight of sodium.—A. S.

Ore-Slimes, &c., containing Gold, Silver, or other Values; Process of Treating —. L. J. Drabek, Turner, S.D. U.S. Pat. 804,186, Nov. 7, 1905.

THE ore-slime, mixed with cyanide solution, is charged continuously into a tank and allowed to settle. The

thickened mass which settles is discharged by its own weight, and that of the overlying cyanide solution, through an opening at the bottom of the tank into the top of a second tank containing fresh solvent solution. The thickened slime is then withdrawn from this tank, mixed and agitated with water, and passed into a third tank containing water, from which the exhausted slime is discharged from time to time as is necessary. The solutions containing the dissolved metals are freed from suspended slime by filtration.—A. S.

Soldering Paste. M. Leisel, Cologne, Germany. U.S. Pat. 804,664, Nov. 14, 1905.

SEE Fr. Pat. 345,593 of 1904; this J., 1905, 32.—T. F. B.

Silvering; Process of Manufacturing a Product for Use in —. W. Bclsterli. Fr. Pat. 355,518, May 15, 1905.

CLAIM is made for the method of preparing a product, which, it is claimed, when simply rubbed on to articles suitably prepared, will give a deposit of silver. 0.8 kilo. of silver nitrate is dissolved in 30 litres of water and precipitated with the necessary quantity of 12 per cent. hydrochloric acid. The silver chloride is filtered off and well washed, and then dissolved, with constant agitation, in a solution of 3.3 kilos. of sodium hyposulphite

(thiosulphate) in 30 litres of water. The solution thus obtained is finally mixed with 1.8 kilos. of 8 per cent. ammonium chloride solution ("esprit de sal ammoniac"), ammonia, and 8 kilos. of levigated chalk.—A. S.

Aluminium, Silicon and their Compounds; Process for the Manufacture of — and the Employment of these Products for the Reduction of Metallic Oxides. E. A. O. Viel and M. Jeantet. Fr. Pat. 355,539, June 7, 1905.

The present patent is an improvement on Fr. Pat. 352,079 of 1905 (this J., 1905, 977), the use of any other suitable kind of furnace being claimed in addition to that of an electric furnace as proposed in the latter.—A. S.

Alloy; Inoxidisable — and Method for Making the same. N. Evangelidi. Fr. Pat. 355,159, June 22, 1905.

To 90 parts of melted copper, 5 parts of aluminium are added, and finally half a part of iron pyrites. Small quantities of antimony, nickel, phosphorus and certain other elements may be added if desired.—J. H. C.

Alloy specially applicable for Jewellery, and Solder for this Alloy. J. B. Chaumet. Fr. Pat. 355,761, June 30, 1905.

The alloy is prepared by melting together aluminium (86—95 per cent.), copper (4 per cent.) and cadmium (1—10 per cent.). It is soft but strong, and does not oxidise on exposure to the air. It can be readily soldered by means of a solder prepared by melting together aluminium (70 per cent.), tin (25 per cent.) and copper (5 per cent.).—A. S.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

(Continued from page 1179.)

(A.)—ELECTRO-CHEMISTRY.

Nickel Oxide Electrode in the Jungner-Edison Accumulator; Chemical Composition of the —. J. Zedner. Z. Elektrochem. 1905, 11, 809—813.

CONTRARY to previous supposition of the formation of a peroxide of nickel, the author has been able to prove by direct analysis that the active nickel oxide has the composition $\text{Ni}_2\text{O}_3 + \text{Aq.}$; the exact degree of hydration, however, has not yet been fixed. It is possible to prepare electrolytically oxides of nickel which show a potential of 1.75 volts, which is the same value as that of the positive accumulator plate measured in the same way against zinc.—R. S. H.

Electrode; Improved —, for Apparatus Producing Radiant Electrical Energy. Siemens and Halske Akt.-Ges., Berlin. Eng. Pat. 25,282, Nov. 21, 1904. Under Int. Conv., Nov. 24, 1903.

The electrode is for use in Röntgen tubes, Geissler tubes, &c., and is constructed of tantalum, or the latter may be used as a carrier for another more easily fusible material.—B. N.

Diaphragms for use in Electrolytic Cells; Impts. relating to Permeable —. H. Hirtz, London. Eng. Pat. 28,129, Dec. 22, 1904.

THIS invention relates to a method of modifying fabrics for use as diaphragms in electrolytic cells, the fabric being successively impregnated with a solution of a double cyanide, and a solution of a metallic salt, so as to deposit an insoluble double cyanide in the material. The

fabrie is impregnated with the soluble double cyanide only, if the metal, of the solution to be electrolysed, itself forms an insoluble double cyanide.—B. N.

Batteries; Impts. in Electric Dry — H. W. Butler, London. Eng. Pat. 29,065, Dec. 30, 1904.

THE zinc cell is lined with a pasty separating mass, consisting of the excitant, such as ammonium chloride, starch or starchy matter, and also a substance, such as plaster of Paris, to give the requisite consistency to the mass, with or without a hygroscopic salt, such as zinc chloride. The mass is subjected to heat and moisture so as to cook the starch. This lining is separated from the carbon element by a suitable depolarising material.—B. N.

Battery; Dry — F. Weatherill, London. Eng. Pat. 8631, April 22, 1905.

THE sheet zinc electrode is bent in one piece and surrounds the grooved carbons which are packed with a depolarising mixture of manganese peroxide and graphite. The electrolyte is a stiff vegetable jelly, made from the palm sago, and containing chlorides of zinc and ammonium and sodium carbonate. The fermentation of the sago keeps the cell from getting dry.—R. S. H.

Electrolytic Cells; Treating the Contents of — J. Hargreaves, Farnworth-in-Widnes, Lancs. Eng. Pat. 25,331, Nov. 22.

THE invention relates chiefly to the electrolysis of alkali chlorides. In order to decompose any hypochlorites or chlorates produced in the electrolytic decomposition of alkali chlorides, a bisulphate is admitted to the anode chamber. Provision is made for jets of liquid to be projected against the internal surface of the diaphragm so as to free it from solid deposits which are apt to raise the electrical resistance of the cell. The dissolved chlorine is removed from the waste anode liquors by means of a partial vacuum or injection of air so as to render them harmless.—R. S. H.

Carbonising Wool, Rags, Silks and other Fibres. S. Roberts. Eng. Pat. 4593, March 6, 1905. V., page 1225.

UNITED STATES PATENTS.

Furnace; Electric — E. Appleby, Chicago, Ill. U.S. Pat. 803,147, Oct. 31, 1905.

A RECEPTACLE, vertically disposed and open at the bottom, is mounted on a frame, a second receptacle, open at the top, surrounding and telescoping with the first. Two electrodes are mounted in the frame, and extend into the furnace near to the lower end of the first receptacle. Mechanism is provided for raising and lowering the second receptacle, and also a means for tilting this vessel and discharging its contents, after it has been drawn out of the telescopic engagement with the first receptacle.—B. N.

Electrolytic Cell. H. S. Anderson, El Paso, Tex. U.S. Pat. 803,263, Oct. 31, 1905.

THE bottom of the electrolytic cell is covered with a layer of mercury, and a cell, open at the bottom, is supported within the electrolytic cell so that the bottom is sealed by the layer of mercury, thus forming an outer washing chamber and an inner electrolyte or cathode compartment. The anode compartment is formed by a cell, with impervious side walls, but with a horizontal porous diaphragm for the bottom, the anode compartment being supported within the cathode compartment so that the diaphragm is close to the mercury. A thin layer of a solution of the substance to be decomposed flows continuously through the cathode compartment, between the diaphragm and the mercury, the pressure of the electrolyte on the diaphragm being greater than that of the liquid in the anode compartment. A horizontal

reciprocating movement is given to the outer cell, thus bringing the mercury successively into contact with the liquids in the electrolyte and washing compartments.

Copper; Crystalline Structure of Electro-Deposited —. A. K. Huntington. Paper read before Faraday Soc., Oct. 31, 1905 [Advance Proof].

THE author explains the fact that copper deposited on to a surface which has a scratch or groove parts very easily along the line of the groove as due to the direction of the lines of crystallisation.

The same phenomenon is observed in castings. The crystals form at right angles to the surface on which the deposit or casting is made. It follows that when the crystals which form on surfaces more or less at an angle to one another meet, there will be want of continuity in the two sets of crystals, and a line of weakness will be developed. The paper is fully illustrated with photographs.—R. S. H.

Aluminium Carbide; Reduction of Metallic Oxides by —. J. N. Pring. Chem. Soc. Trans., 1905, 87, 1530—1540.

ALUMINIUM carbide was prepared by heating aluminium in a carbon crucible in a Moissan electric arc furnace. With a furnace of the dimensions shown (see Fig. 1), 2 kilowatt-hours were required, on the average, to heat the aluminium (300—400 grms. in pieces about the size of a walnut) to the boiling point. The furnace worked very steadily with a current of 250—300 amperes at 35—45 volts. To obtain good results, it was found necessary to take at least 9 mins. in heating the aluminium to the boiling point, and to continue the heating for about 6 mins. after this point was reached. When the aluminium began to boil, the voltage fell considerably; the return of the current to its normal condition indicated the completion of the process. During the cooling, a large quantity of metallic aluminium was forced out from the surface of the carbide. When the mass was cooled out of contact with furnace gases and air, the exuded metal was found to contain 99.9 per cent. of aluminium, showing that aluminium carbide is insoluble in metallic aluminium. The yield of aluminium was greatly diminished by working in an atmosphere of hydrogen, and the change in weight of the crucible and its contents, together with the formation of a large quantity of alumina, showed that the carbide is formed chiefly, and probably entirely, by the action on the aluminium of carbon monoxide derived from the carbon dioxide evolved from the limestone blocks of the furnace. $3\text{CO} + 6\text{Al} = \text{Al}_2\text{O}_3 + \text{Al}_4\text{C}_3$. The product obtained contained, on the average, aluminium carbide, 30; alumina, 25; carbon, 2; and aluminium, 43 per cent. After treatment in the cold with strong caustic soda solution, a product was obtained

Elevation (section c d).

Plan (section a b).

0 5 10 cm.

FIG. 1

Plan (section m n).

FIG. 2.

containing only about 2 per cent. of metallic aluminium. It was not found possible to obtain the carbide free from alumina, as the latter occurred in a very stable and insoluble form.

Numerous experiments were made as to the action of the carbide on metallic oxides (cupric, ferric, lead and bismuth oxides), with and without a flux, and in some cases in contact with a bath of molten metal. In the latter experiments, the apparatus shown in Fig. 2 was employed. The current was led into the furnace by graphite bars, 5.0×2.4 cm. in cross-section, Acheson graphito being tightly packed around these for a distance of 12 cm. The resistance core, in which the carbon crucible, 4 cm. in outside diam., and 3 cm. high, was embedded consisted of particles of retort carbon of uniform size. Above the crucible and clamped in contact with it was a carbon cylinder 12 cm. high, fitted with a brass branch tube, through which hydrogen or other gas could be passed. By means of a graphite piston fitting loosely in the cylinder, the slag could be pressed beneath the surface of the molten metal. In general, the experiments with metallic oxides showed that aluminium carbide acts as a strong reducing agent, but up to about 1400° C. no separation of aluminium or of

carbon could be detected. For example, with copper oxide, metallic copper, alumina and carbon dioxide were produced, together with small quantities of carbon monoxide. At higher temperatures, alloys of aluminium and the reduced metal were obtained, the percentage of aluminium in the alloys increasing with the temperature of the reaction. Copper alloys were obtained containing up to 28 per cent. of aluminium, and iron alloys containing up to 46.7 per cent. When the reaction between ferric oxide and aluminium carbide was effected in contact with a bath of molten iron, alloys were obtained in which more than 90 per cent. of the aluminium in the carbide used had been set free and taken up by the iron.

Aluminium carbide reacts with copper at a temperature below the melting point of platinum, and with iron just above this temperature, alloys being produced, and free carbon liberated. (See also this J., 1895, 353.)

Reaction between Calcium Carbide and Lead Oxide at a High Temperature.—By dropping lead oxide, in very small quantities, into molten calcium carbide, an alloy containing 2.6 per cent. of calcium was obtained. (See this J., 1898, 33; 1901, 582.)

Action of Metallic Calcium on Aluminium Carbide.—Aluminium carbide was reduced by metallic calcium at temperatures above the melting point of the latter. At the lower temperatures used, 83 per cent. of the carbide was reduced, but the amount of reduction diminished as the temperature of reaction rose. The reverse reaction, $3\text{CaC}_2 + 8\text{Al} = 2\text{Al}_4\text{C}_3 + 3\text{Ca}$, was also found to take place, the amount of calcium carbide reduced ranging from 7 to 25 per cent. according to the temperature.—A. S.

Passive State of Metals; Theory of the —. W. J. Müller. Z. Elektrochem., 1905, 11, 823–824.

THE author summarises his views on the passivity of metals (this J., 1904, 751), showing how closely the phenomenon is connected with questions of valency. He considers the passive and active forms of the metal as two phases which are never in stable equilibrium.—R. S. H.

ENGLISH PATENTS.

Metals; Apparatus for Electro Deposition of —. B. M. Bailey, Walsall, Staffs. Eng. Pat. 26,849, Dec. 9, 1904.

THE materials to be plated are enclosed in a perforated aluminium barrel, which is not only rotated around a horizontal axis, but is also held in a carriage which is moved to and fro through a long vat. Anode plates are hung around the sides of the vat and afford a much larger anode surface in proportion to the work surface than is usually employed.—R. S. H.

Copper; [Electrically] Annealing —. E. A. Claremont, Manchester. Eng. Pat. 3032, Feb. 14, 1905.

THE copper article to be annealed is, whilst being submerged in water, heated to the required temperature by an electric current, on arresting which, the article cools in the same vessel, whereby contact with air whilst cooling is obviated. Apparatus is shown whereby a continuous wire or band of copper may be conducted into a vessel containing water, by passage over two submerged conducting rollers, placed at a certain distance apart, and respectively in connection with the two terminals of a dynamo.—E. S.

UNITED STATES PATENTS.

Electrolytic Process [Copper Deposition] Using Insoluble Anodes. A. G. Betts, Troy, N.Y. U.S. Pat. 803,543, Nov. 7, 1905.

THIS invention relates to a process of converting, in solution, ferrous to ferric sulphate, and simultaneously depositing copper. The solution, practically free from halogen ions, is electrolysed, using an insoluble carbon anode and a suitable cathode. The anode is moved through the solution in order to facilitate the continuous oxidation of the ferrous salt by the liberated anions, and at the same time prevent the evolution of gas containing oxygen at the anode.—B. N.

Lead; Apparatus for Refining —, by Electrolysis. A. G. Betts, Troy, N.Y. U.S. Pat. 803,544, Nov. 7, 1905.

THE lead to be refined is used as the anode, an electrolyte being employed which is adapted to dissolve metal from the anode, and electro-deposit the same on a suitable cathode. The electrolytic tank has a lining of copper plates soldered together at their adjacent edges, the soldered connections being electroplated with copper, and the whole of the copper lining is coated with insulating material.—B. N.

Anode-Slimes; Process of Treating —. E. F. Kern, Assignor to A. G. Betts, both of Lansingburg, N.Y. U.S. Pat. 803,601, Nov. 7, 1905.

THE anode-slime is mixed with sulphuric acid, and roasted with access of air so as to convert arsenic and antimony into oxides, the arsenic being volatilised as arsenious acid. Copper is extracted from the product by means of a solution containing sulphuric acid, and the antimony is extracted from the residue with a suitable solvent.—B. N.

FRENCH PATENT.

Furnaces; Electric —. Metallurgiska Patentaktiebolaget. Fr. Pat. 355,756, June 30, 1905. Under Int. Conv., July 11, 1904.

IN furnaces of the induction type in which an annular crucible surrounds a central high tension coil, it is necessary to provide means for protecting the latter from heating. For this purpose a double-walled jacket through which cold air or water can be passed, immediately surrounds the high tension coil. The metal jacket does not form a complete cylinder, but is broken at least once throughout its length by some insulating material to prevent the production of induction currents in the jacket.—R. S. H.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

(Continued from page 1180.)

Enzyme Action; Studies on —. Lipase. H. E. Armstrong. Roy. Soc. Proc., 1905, 76, 606–608.

IN the hydrolysis of fatty oils by the lipase of ground castor-oil seeds, little or no action takes place unless an acid is present. The author finds that any acid is effective provided a sufficient amount be used. Aspartic and glutamic acids, which are formed at an early stage of the germination of seeds, were found to be highly active, but glycine and asparagine were practically without effect. Different acids in equivalent quantities do not have equal effects, and it is probable that the strength of the acid is a factor in the action. Apparently the acids do not act merely by liberating the enzyme, since when the material, free from fat, was digested with sulphuric acid under the conditions which favour the maximum lipolytic action, the product, when washed free from acid, had become perfectly inactive, either when used alone or with the addition of a fresh quantity of acid. The Ricinus enzyme has very little action on ethyl butyrate, acetin, or the dimethylic esters of tartaric and racemic acids. It is also almost without action on ethyl mandelate, which is said to be readily attacked by animal lipase; its action is therefore probably specific for the glycerides of the higher acids of the fatty series.—J. F. B.

Wool-Fat; Water-absorbing Power of —. J. Lifschütz. Apoth.-Zeit., 1905, 20, 857. Pharm. J., 1905, 75, 723.

THE author finds that if wool-fat be dissolved in benzene (petroleum spirit) and the solution digested with animal charcoal at 50°–60° C., then the residue left after distilling off the solvent from the filtered solution has a much smaller water-absorbing power than the original fat. Further, by exhausting the animal charcoal with alcohol, and evaporating the alcoholic solution, a very tough, adhesive, fatty substance is left, which is capable of absorbing water to a very marked extent. For

example, it is stated that 2 per cent. of this substance is sufficient, when mixed with paraffin ointment, to render the latter capable of taking up a large proportion of water.

—A. S.

ENGLISH PATENT.

Soaps or Soap Size; Utilisation of Waste Products in the Manufacture of —. H. Arledter, Widnes. Eng. Pat. 28,442, Dec. 27, 1904.

THE saponification of resins, fats, and oils by means of sodium carbonate, or other suitable alkali, is effected in a closed steam-jacketed boiler, provided with a rotary stirrer (*cf.* Eng. Pats. 17,077 of 1902 and 1049 of 1903; this J., 1903, 569; 1904, 196). The mixture of carbon dioxide, steam, and the more volatile constituents of the resin, chiefly turpentine and rosin oil vapour, after arriving at a given pressure in the boiler, is constantly allowed to pass through a weighted valve or otherwise into a large vessel. This vessel contains a froth-breaking grid having a series of sharp ridges or points all over its under surface for the purpose of breaking the bubbles of the froth, in the upward course of the vapours through the vessel. The mixed vapours pass through a condensing worm and the condensed portions run into a series of collectors, or into a single collector, with draw-off cocks at different levels. The carbon dioxide passes on to the usual purifying apparatus and then to a compressor. The liquids in the collector arrange themselves, on being allowed to settle, in layers; the turpentine and lighter oils or spirits form the uppermost, an oil not soluble in turpentine an intermediate layer, whilst the water settles at the bottom. The water is found to have absorbed certain constituents of the rosin very similar to, if not identical with, what is known as Russian turpentine, and this solution is claimed as an excellent disinfectant.

The other liquids are drawn off from their respective layers, and, if necessary, can be redistilled and separated.

—E. W. L.

UNITED STATES PATENTS.

[*Fat*] *Rendering or Reducing Apparatus.* E. R. Edson and B. F. Silliman, Cleveland, Ohio, Assignors to the Edson Reduction Machinery Co., Augusta, Me., U.S.A. U.S. Pat. 803,050, Oct. 31, 1905.

THE apparatus claimed comprises a rendering vessel provided at the top with a dome, the inner chamber of which is in communication with the interior of the vessel. Means are provided for the introduction of the material at the bottom and for heating it, whilst a pneumatic pressure is maintained within the dome in excess of that resulting from heating the liquid in the vessel. There is also a valved vapour pipe between the dome and the vessel, with means for the production of suction or for interrupting the passage of the vapour, together with a valved liquid-conducting pipe, means for pumping water into the rendering vessel, and a hollow shaft with lateral arms through the openings in which fluid can be discharged into the interior of the vessel.—C. A. M.

Drying Material from which Oil has been Extracted; Process of —. E. R. Edson and B. F. Silliman, Cleveland, Ohio, Assignors to The Edson Reduction Machinery Co., Augusta, Me., U.S.A. U.S. Pat. 803,051, Oct. 31, 1905.

THE material, from which the oil has been extracted by the apparatus described in the preceding abstract, is stirred continually whilst the liquid is being drained off, and the free moisture still remaining evaporated, after which heated air is admitted and distributed throughout the mass.—C. A. M.

FRENCH PATENTS.

Fats; Apparatus for the Extraction of — by means of Carbon Tetrachloride, &c. A. E. Urbain. Fr. Pat. 355,813, July 1, 1905.

THE apparatus claimed consists of a battery of at least seven connected extraction vessels together with distillation apparatus and condensers. The extraction vessels are cylindrical in form and are preferably arranged to

receive the superheated vapour of the solvent under low pressure. They are advantageously made of stannic iron, with joints and pipes of lead.—C. A. M.

Enzymic Hydrolysis [of Fats]; Active Product —. E. Urbain. Fr. Pat. 350,179, Sept. 15, 1904.

CLAIM is made for the use of amino-acids as stimulating agents in the hydrolysing action of cytolipase upon fatty oils, and it is stated that, with this addition, 0.025 per cent. of the dry enzymic agent is sufficient for the hydrolysis of the oil on a manufacturing scale. A simple method (claimed) of obtaining these active products is to triturate oil-cake with its own weight of water, and to allow the mixture to undergo spontaneous proteolytic hydrolysis at 40° C. After eight days the mass is filtered, and the filtrate used in place of water in the enzymic hydrolysis of oils.—C. A. M.

Soap Liquors; Evaporator for Treating Waste —. Milwaukee Evaporator Co. Fr. Pat. 356,086, July 12, 1905.

SEE U.S. Pat. 794,831 of 1905; this J., 1905, 880.—T. F. B.

XIII.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(Continued from page 1181.)

(A.)—PIGMENTS, PAINTS.

ENGLISH PATENTS.

Lakes [from Azo Dye-stuffs]; Manufacture of Colour —. C. D. Abel, London. From Act.-Ges. f. Anilinfabr., Berlin. Eng. Pat. 27,496, Dec. 16, 1904.

THE insoluble metallic salts of the azo dye-stuffs formed by combining a diazotised aminosulphonic acid of the benzene or naphthalene series with *o*-nitrophenol, constitute colour lakes very fast to light. Three lakes are described, prepared from sulphamlic acid, naphthionic acid, and 1,3,4-chloroaminobenzenesulphonic acid respectively; all are yellowish-red in colour.—T. F. B.

Pigment Colours [from Azo Dye-stuffs]; Manufacture of Yellow and Orange —. O. Imray, London. From Farbwerke vorm. Meister, Lucius und Brüning, Hoechst a/Main, Germany. Eng. Pat. 28,259, Dec. 23, 1904.

YELLOW to orange lakes, stated to compare favourably with chrome pigments as regards fastness, are obtained by precipitating on a white substratum, an azo dye-stuff produced by combining a diazotised unsulphonated base with a pyrazolone. For example, 50 kilos. of sodium sulphate dissolved in 500 litres of water are added to 250 kilos. of a 20 per cent. paste of the dye-stuff from *o*-naphthylamine and phenylmethylpyrazolone suspended in 2,000 litres of water; a solution of 100 kilos. of barium chloride in 500 litres of water is then stirred in to the mixture.—T. F. B.

Pigments; Manufacture of —. J. F. Bennett, Dronfield, Derby, and J. Mastin, Sheffield. Eng. Pat. 15,398, July 27, 1905.

THE improved process of making pigments the object of which is to produce pigments of an absolutely permanent character, consists in grinding together to a paste in water, substances of a clayey, stony, earthy, or vitreous nature, and certain metallic oxides, or "prepared oxides," such as are commonly used in the pottery trades; drying, and powdering the paste, and subjecting the powder to the heat of a furnace, of such a temperature that the requisite colour is obtained, and for such length of time that the colour strikes through the whole substance. For example, 8 parts of black oxide of cobalt, 12 parts of oxide of zinc and 36 parts of alumina, when incorporated with 20 times their combined bulk of clay and treated as described, yield a rich blue pigment in the case of a white clay, and a rich green in the case of a yellow clay. Long continued firing in this case improves the colour.

—E. W. L.

FRENCH PATENTS.

Paint; Process of Manufacturing — J. H. Lebon.
Fr. Pat. 350,171, Sept. 13, 1904.

The inventor proposes to utilise the oxidising action of manganese oxides on colloidal substances, such as albumin, in presence of alkalis and an antiseptic, the proportions recommended being manganese oxide 3 parts by weight, colloid 10, alkaline substance 1.5, calcium carbonate 15, zinc oxide 10, 90° alcohol 1, volatile antiseptic oils 1—3, boric acid 1 part, with a variable quantity of water according to circumstances. The colloid is first treated with the alkali, dissolved in filtered water at 25° C., and mixed with the colouring matters and the antiseptics. The product is suitable as a ground colour and dries hard.

—C. S.

Lithopone which Remains White when Exposed to Light; Process of Making — R. Alberti. Fr. Pat. 356,144, July 10, 1905.

SEE Eng. Pat. 13,455 of 1905; this J., 1905, 978.—T.F.B.

(B).—RESINS. VARNISHES.

Colophony; Decomposition Temperature of American — C. Schwalbe. Z. angew. Chem., 1905, 18, 1852.

ACCORDING to Tschirch and Studer (this J., 1903, 1250) American colophony cannot be distilled from glass vessels, but when distilled *in vacuo* in an iron tube, yields a yellow substance resembling colophony. On the other hand, Easterfield and Bayley (this J., 1904, 989) assert that they have distilled colophony with but little decomposition from glass vessels under a pressure of 31 mm., and at a temperature of 270°—290° C., but that at a pressure of 100 mm. decomposition is inevitable. The author has studied the effect of heat upon the colophony under conditions comparable with those that occur in the manufacture and applications of the resin. In the preparation of colophony, the crude pine resin is distilled in the presence of steam until no more oil of turpentine passes over, and the residual resinous mass is freed from water by fusion. If this process be carried out over a fire, superheating above the melting point of the resin can scarcely be avoided; even if indirect steam be used, temperatures of 120° to 150° C. may be reached. The same remarks apply to the fusion of the resin in the preparation of colophony sizing. Experiments, in which American colophony was gradually heated to 160° C. in glass vessels, through which was passed a current of air freed from carbon dioxide, showed that the resin or its chief constituent, abietic acid, began to decompose with the liberation of carbon dioxide, even at a temperature as low as 120°—130° C.—C. A. M.

Lac; The Commercial Grades of — and their Valuation. J. C. Unney. Pharm. J., 1905, 75, 653—654.

The various grades of lac met with in commerce are described, and the methods for their analysis discussed. Parry's results (this J., 1901, 1245; 1902, 782; 1903, 320) are confirmed. The Hübl method is preferred as giving the most constant figures for the iodine value. The figure 10 is suggested as a standard iodine value on

which the percentage of rosin is to be calculated. The paper concludes with analytical data concerning various kinds of lac, and also touches briefly on the bleaching of shellac. (See also Langmuir, this J., 1905, 12.)—T. F. B.

FRENCH PATENT.

Phenolic Alcohols; New Condensation Products [Gum-Resins] of — Fabr. de Prod., Chim. Organique de Laire. Fr. Pat. 350,180, Sept. 16, 1904.

PHENOLIC alcohols, such as saligenin, *p*-hydroxybenzyl alcohol, the alcohol $\text{CH}_3\cdot\text{C}_6\text{H}_3(\text{OH})(\text{CH}_2\text{OH})$ derived from *p*-cresol, are heated under reduced pressure between their melting and boiling points. Water is given off, and, on cooling, a hard, homogeneous, transparent and slightly coloured substance is obtained. The products resemble the natural hard gum-resins in their properties, and can be used in place of lacs, copals, &c.—F. S.

(C).—INDIA-RUBBER, Etc.

Rubber Plants; Notes on Some — A. Chevalier. Comptes rend., 1905, 141, 683—686.

STATEMENTS have recently appeared to the effect that some examples of a botanical species of plant produce rubber, whilst others of the same species give none. The result of seven years' experience in various parts of Africa has led the author to the conclusion that these statements are entirely erroneous, and that every individual of a rubber-bearing species which is fully grown, and has been cultivated under natural conditions, produces rubber. This conclusion is substantiated by instances of specimens of *Ficus elastica*, *Landolphia owariensis*, *L. Klainei* and *Manihot Glazieri* grown under widely differing conditions, all of which produced rubber when fully matured. It is pointed out that the yield of rubber from examples of the same species, grown under identical conditions, may differ considerably, but that the general properties of the rubbers from such examples, are identical. In many cases, the young branches of rubber plants contain viscine in their latex, the rubber not making its appearance until the second or third year.—T. F. B.

ENGLISH PATENTS.

Rubber Waste; Method of and Apparatus for Treating — R. R. Gubbins, London. Eng. Pat. 2575, Feb. 8, 1905.

A TANK is filled with rubber waste, and the latter saturated with sulphuric acid or other carbonising fluid, and the contents heated to boiling point. A second tank is filled with rubber waste, which is then heated, and the liquid in the first tank is transferred to the second and the boiling continued. The first tank is filled up with water, the latter boiled, a suitable alkali being added to neutralise the acid, and the liquid afterwards drawn off. The rubber waste is removed for after treatment to extract the rubber, and the tank again filled with fresh rubber waste, the operations being then repeated. Two or more tanks are used, and arrangements are employed for lifting them alternately to allow of the liquid in one tank being emptied into the other.—B. N.

Caoutchouc Solutions; Process for the Production of Aqueous — and for the Regeneration of Caoutchouc Waste. P. Alexander, Charlottenburg, Germany. Eng. Pat. 14,681, July 17, 1905.

THE production of aqueous solutions of caoutchouc, raw or vulcanised, is accomplished by first heating the rubber under pressure at 150° C. with one of the known hydrocarbon or other solvents of rubber, and then heating the solution obtained with a strong alkaline liquid, such as

aqueous caustic soda solution, under pressure at the same temperature. On submitting the product to distillation in a current of steam, the organic solvent is removed, and the rubber remains dissolved in the alkaline liquid. This solution may be readily filtered, and the rubber precipitated from the filtrate by the addition of acid, or by combustion gases. In the utilisation of the process for the regeneration of rubber waste, the waste is treated as described above, and, on filtering the aqueous solution, or by subsidence, the mineral and other impurities present are removed, and the caoutchouc material may be precipitated from the solution by suitable precipitants. By this means a specifically light regenerated rubber, containing only fractions of a per cent. of mineral matters, can be obtained from the specifically heaviest substances.—E. W. L.

Leather; Manufacture of — for use as a Substitute for India-Rubber and for various other Purposes. J. Owen and T. Threlfall. Eng. Pat. 19,780, Sept. 14, 1904. XIV., see below.

[XV.—MANURES, Etc.

(Continued from page 1182.)

Nitrites and Nitrites as Manures; Use of —. T. Schloesing. Comptes rend. 1905, 141, 745-746.

EXPERIMENTS were carried out in which maize was grown in pots, each pot containing 9 kilos. of soil and receiving the addition of 0.405 gm. of phosphoric anhydride (as superphosphate), 1.5 gm. of potassium sulphate and a quantity of nitrate or nitrite equivalent to 0.20 gm. of nitrogen. From the weight of ripe grain obtained, it is seen that sodium nitrate and nitrite and calcium nitrate and nitrite are equally efficacious as manures. The crop obtained in pots to which nitrate or nitrite had not been added was about 20 per cent. less than that yielded by the other pots. The calcium nitrate used in the experiments was prepared with nitric acid obtained by the action of an electric discharge on air.—W. P. S.

Calcium Cyanamide; Reactions of — in Agricultural Practice. R. Perotti. Staz. sperim. agrar. ital., 1905, 38, 581-609. Chem. Centr., 1905, 2, 1507.

AT the ordinary temperature and pressure, calcium cyanamide suffers hydrolytic decomposition in aqueous solution, with formation of ammoniacal compounds, as ammonia, urea, &c., which have no injurious action on vegetation. The decomposition, however, proceeds very slowly, and considerable loss of soluble nitrogen may take place. In the soil, however, owing to the presence of humus, the decomposition proceeds more rapidly, and owing to the absorptive power of the soil, the losses are much smaller than in aqueous solution. The use of peat with calcium cyanamide (this J., 1905, 554) is especially suitable, as in contact with that substance, calcium cyanamide is very rapidly decomposed, without any appreciable loss of nitrogen. (See also this J., 1905, 143.)—A. S.

PEAT is dried, powdered, and saturated with a boiling potash or soda lye of from 1 to 3 per cent. strength, and the mass is mixed with powdered calcium phosphate, and spread out to dry. Lastly, the product is incorporated with a suitable proportion of powdered "potash."—E. S.

XVI.—SUGAR, STARCH, GUM, Etc.

(Continued from page 1182.)

Saccharose in Scammony Root; Presence of —. P. Requier. *J. Pharm. Chim.*, 1905, 22, 435—438.

AFTER precipitating the resins extracted from scammony root with water, the aqueous liquid contains besides a tannin and a reducing sugar, a considerable amount of saccharose, equivalent to 3.36 per cent. on the dry root. —J. O. B.

[*Sugar*] *Syrups; Viscosity of —.* J. de Grobert. *Bull. Assoc. Chim. Sucr. Dist.*, 1905, 23, 424—426.

REDUCING agents, e.g., sulphurous acid or hydrosulphites, are used to some extent in sugar factories and are regarded as having a distinctly favourable action on the rapidity of the concentration and the crystallisation of the syrups.

Fouquet in certain experiments with these reducing processes failed to observe any diminution of the viscosity of the syrups as a result of the treatment. The author points out that the function of these agents is to modify the nature of the non-sugar constituents, and that it is only near the crystallising point that the influence of the quantity and, above all, of the quality of the non-sugar makes itself felt. Even if the purity of the syrup is not increased by the treatment, the constitution of the non-sugar constituents should be changed in a direction which is frequently favourable. Unfortunately sulphitation is rarely pushed sufficiently far to obtain this benefit, most factories being content with a slight decrease in the alkalinity and a certain amount of decolorisation. The author is convinced that if sulphitation be applied in a full degree, the effect of the treatment on the viscosity of the syrups will be well marked, provided that the measurements of viscosity be made on syrups as concentrated as possible. —J. F. B.

Dextrin; Dichloroacetic Ester of —. Klidiashwili. *Russ. Phys. Chem. Ges.*; through *Brewers' J.*, 1905, 41, 688.

TWENTY grms. of rice starch were heated with 40 grms. of dichloroacetic acid under a reflux condenser until the colour reaction with iodine could no longer be observed. The product was poured into water and dried over sulphuric acid. The determination of the molecular weight, in acetone solution, of the dextrin dichloroacetic ester obtained indicated a sextuple molecule. The proportion of dextrin in the ester was determined by saponification by calcium hydroxide and precipitation of the dextrin by alcohol. —J. F. B.

XVII.—BREWING, WINES, SPIRITS, &c.

(Continued from page 1184.)

Yeast; Probable Existence of Emulsin in —. T. A. Henry and S. J. M. Auld. *Roy. Soc. Proc.*, 1905, 76, 568—580.

THE authors have observed that yeast decomposes amygdalin in the same manner as emulsin does, with the production of benzaldehyde and hydrocyanic acid, whilst

the dextrose is fermented. This action is independent of that of the invertase of yeast, which is manifested by the action of an aqueous extract of yeast on amygdalin, and which only proceeds as far as the production of mandelonitrile-glucoside and dextrose. Yeast preparations free from living cells, e.g., "Aceton-Dauerhefe" and Buchner's yeast cell-juice also decompose amygdalin in the same manner, but not so rapidly as living yeast. Hydrocyanic acid has no inhibitive influence upon the activity of the glucosidolytic enzyme of yeast-juice, but this activity undergoes a slight diminution when the juice is kept for some time, owing to the digestive action of the yeast-trypsin. By the fractional coagulation of yeast juices by heat, as described by Wroblewsky (this *J.*, 1899, 156), the resistance of the glucosidolytic enzyme to heat was determined. When the yeast juice was heated for 30 minutes at 58° C., the filtrate from the coagulum produced thereby was free from zymase and endotryptase, but still contained the glucosidolytic enzyme and the invertase in the active state. When this filtrate was caused to act upon amygdalin at 40° C., dextrose was produced in addition to the benzaldehyde and hydrocyanic acid. The glucosidolytic enzyme of yeast hydrolyses amygdalin, salicin, arbutin, phaseolunatin, and mandelonitrile-glucoside, but does not attack sinalbin, digitalin or quercitrin. The temperature at which its activity is destroyed is about 70° C., and it is most active at 40° C. Its activity is inhibited by the presence of small quantities of alkalis or mineral acids, but is not affected by antiseptic agents. In all these respects this enzyme so closely resembles the emulsin of almonds that there remains little doubt that the two are identical. —J. F. B.

Yeasts; Non-Inverting —. Van Laer. *Centrabl. Bakt.*; through *Brewers' J.*, 1905, 41, 688.

THE number of species of saccharomycetes and allied organisms (torulaceae) which are endowed with the power of inverting saccharose is comparatively small, but this power cannot be used for a systematic classification since the elaboration of the enzymes depends on the environment. In some cases the inverting enzyme is secreted in the cell, but is not transfused through the cell wall into the surrounding medium. In the case of strongly aerobic organisms like *Mycoderma*, the saccharose-inverting enzyme may be present, but the products of inversion may be oxidised before they can be detected. With other ordinarily non-inverting organisms, in which the oxidising action is less powerful than in *Mycoderma cerevisiae*, the production of invert sugar in saccharose media can be detected under certain conditions. *S. hyalosporus*, *Torula pulcherrima*, *S. apiculatus*, *S. anomalous*, *S. farinosus*, and an unnamed yeast (I.B.) from Jörgensen have been studied from this point of view, and the author concludes that when the vegetative cells predominate, the non-inverting species are capable of inverting the saccharose nutrient as a preliminary to its assimilation. —J. F. B.

Enzyme Action; Studies on —. III. Synthetic Action of Acids Contrasted with that of Enzymes. Synthesis of Maltose and Isomaltose. E. F. Armstrong. *Roy. Soc. Proc.*, 1905, 76, 592—599.

THE author has extended the work of Hill (this *J.*, 1898, 684 and 1903, 505) and of Emmerling (this *J.*, 1901, 377) on the synthesis of bioses from dextrose, and has correlated his results with the theory of the constitution of the glucosides.

Synthetic Action of Hydrochloric Acid.—100 grms. of glucose [dextrose] were dissolved in 300 c.c. of concentrated hydrochloric acid, the solution was cooled to 0° C. and treated with hydrogen chloride gas until the colour began to darken. The solution was kept at a temperature below 10° C. for about 40 hours, then neutralised with lead carbonate, shaken with silver carbonate and filtered. In the product of the reaction the two bioses, isomaltose and maltose, were characterised, the former being present in larger quantity than the latter.

Synthetic Action of Yeast-maltase.—50 grms. of glucose were dissolved in 75 c.c. of a filtered aqueous extract of top yeast and the solution was digested in presence of

toluene for two to three months at 25° C. After the removal of the fermentable sugar, isomaltose was definitely characterised in the product; maltose was probably absent.

Synthetic Action of Emulsin.—50 grms. of glucose were digested with 75 c.c. of a solution containing 1 gm. of emulsin under conditions identical with those employed with yeast-maltase. The product of the reaction was entirely fermentable, and, therefore, free from isomaltose. Further, after the removal of the glucose by *S. marxi*anus, the presence of maltose was established.

According to the glucoside theory, maltose is glucose- α -glucoside sensitive to maltase, whilst isomaltose is glucose- β -glucoside and is hydrolysed by emulsin. The synthetic action of acids, like their hydrolytic action, is non-specific, and the condensation of glucose under the influence of hydrochloric acid therefore gives rise to the formation of a mixture of both (α - and β -glucosides, the maltose and isomaltose) in proportions in equilibrium with their relative stabilities. But the hydrolytic action of the enzymes, on the other hand, is selective, maltase acting only on α -glucosides and emulsin on β -glucosides. Similarly it is now found that their synthetic action is also selective, and that only a single biiose is produced by each enzyme, viz., the biiose which is isomeric with the one which is hydrolysed by the same enzyme.—J. F. B.

Enzyme Action; Studies on —. VIII. *The Mechanism of Fermentation.* E. F. Armstrong. Roy. Soc. Proc., 1905, 76, 600—605.

The author has investigated the fermentability of various sugars by various species of yeast, the results being set forth in the following table:—

Yeast.	Dextrose.	Levulose.	Mannose	Galactose.	Maltose.	Saccharose.	Lactose.
Yeasts containing maltase and invertase.

No. 698.....	+	+	+	+	0	+	+
Yeasts without sucroclastic enzymes.							
<i>S. apiculatus</i>	+	+	+	0	0	0	0
<i>S. apiculatus Schweiz</i>	+	+	+	0	0	0	0
<i>S. mali Duclauxi</i>	+	+	+	?	0	0	0

It is remarked that all the yeasts are able to ferment dextrose, levulose, and mannose, apparently with equal ease, and that these three hexoses all have the same enolic form. Hence it is concluded that the formation of the enol is the initial stage in the fermentation of the hexose, and that the breakdown of the molecule commences at the terminal carbon atom, the resistance of the bioses to direct fermentation being due to the stability of the carbon-oxygen ring and the consequent non-formation of the enol. The different behaviour of the yeasts towards galactose indicates that the mechanism of fermentation of this hexose is a different one from that according to which the three other hexoses are fermented, but it is also certain that the fermentation of galactose is equally independent of the presence of any of the sucroclastic enzymes.—J. F. B.

Amyl Alcohol; Formation of — in Fermentations by Beer Yeast. J. Efront. Bull. Assoc. Chim. Sac. Dist., 1905, 23, 393—397.

The author discusses the work of Ehrlich (this J., 1905,

683), in which the origin of the fusel oil is traced to the amino acids of the wort. He regards this as a very important discovery which should lead to the manufacture of fusel oil on a more extended scale. He has made some preliminary experiments in this direction by converting the albuminoids of brewers' grain into amino acids by the action of mineral acids. The addition of 5–6 kilos. of these "peptonised" grains per hectolitre of molasses wash considerably increases the yield of fusel oil. The increase in the quantity of fusel oil is proportional to the quantity of peptonised grains added. The maximum yield of fusel oil obtained amounted to 5–6 per cent. of the ethyl alcohol produced. The more closely the maximum of fusel oil is approached, the worse is the yield of ethyl alcohol. Amyl alcohol is also a product of the autodigestion of yeast; the quantity formed varies very largely according to the conditions. It is produced with maximum intensity at the period when denutrition is very far advanced and its formation does not cease before the death of the cells. It would appear, therefore, that the fusel oil is not a direct product of the living cells, but is formed by the action of an enzyme secreted by the yeast cells.—J. F. B.

Wort from Mash; Method and Apparatus for Separating — by Centrifugal Action. R. Raeger, Ehrenberg,

and M. Güttner. Chemnitz, Germany. Eng. Pat. 8576, April 20, 1905.

DURING the centrifugal process, the mash is caused to pass over a suspended layer of spent malt or grain either increasing or decreasing in thickness from the top towards the bottom. The centrifugal apparatus consists of a truncated conical perforated wall fixed to a vertical shaft. Inside this wall is a horizontal mash-distributor adapted to revolve with the wall. The distributor is arranged concentrically within the upper part of the latter, and the lower edge of the wall is provided with an annular flange projecting inwards. A number of annular walls may be provided within the perforated wall, and, in this case, holes or recesses are provided so that the wort takes a zig-zag path, and the coagulated albuminous matters and other impurities are pressed and retained against the inner surfaces of these walls. The mash-distributor may revolve at a different speed to that of the perforated wall. An outside jacket encloses the apparatus, and is fitted with apertures which allow the supply of air to be regulated, and the jacket may be

provided with means for keeping the wort at a suitable temperature.—W. P. S.

Fermented Liquors; Material for use in Manufacture of —. E. C. Schrottky, Calcutta. Eng. Pat. 23,277, Oct. 28, 1904.

Raw grain, such as maize, rice, wheat or barley is steeped in water (preferably hard water) for about three days, the water being changed every twelve hours. The water is then drained off and the grain is thoroughly mixed with pressed brewers' yeast, suspended in ten times its weight of water, about 1 part of pressed yeast being taken for every 100 parts of moist grain. Care must be taken that practically every grain comes in contact with the yeast. The mixture is then fermented at a temperature of 85° F. for ten to fourteen days in a closed vessel, after which it is either steamed or dried on the kiln. This treatment effects such a modification of the endosperm and albuminoids of the raw grain, that it may be used in admixture with barley malt for the preparation of worts, equivalent in body, flavour and yeast nutrients to those prepared entirely from malt.—J. F. B.

Beer; Apparatus for Chilling and Carbonating —. E. G. Adlam, Bristol. Eng. Pat. 1337, Jan. 24, 1905.

THE apparatus consists of a series of "battery" of tubes disposed parallel to the axis of rotation, so as to act as beaters to agitate the beer. This "battery" constitutes a multitubular vessel, through the tubes of which the chilling agent is caused to pass. It is caused to rotate in a stationary, insulated cylinder or drum, into which the beer is charged, and in which it is chilled and carbonated. The multitubular vessel is mounted in the stationary drum on a "tubular-ended shaft," serving for the admission and escape of the cooling agent, and arranged to rotate at two different speeds as desired.—J. F. B.

Fermentation Backs; Apparatus for Collecting and Sterilising Carbonic Acid Gas from —. J. C. Stead and T. C. Palmer, London. Eng. Pat. 27,396, Dec. 15, 1904.

ONE or more gas-collecting bells of light construction are suspended in the fermenting wort and are counterbalanced so that they will just sink when cocks, situated at their highest points, are opened. Each of the bells is connected to a gas holder by means of a flexible tube attached to the collecting main. The bells are dipped in the liquid, the cocks are closed and the gas which is at first collected is expelled; the flexible tubes are then connected with the cocks and the gas which is evolved is conducted to the reservoir. From this the gas is pumped through washing vessels and finally through a filter of porous earthenware, which sterilises the gas by filtration, and which can itself be sterilised by periodical steaming.—J. F. B.

Food [Molasses Fodder] for Animals and for other Purposes; Process for Making a Product for use as —. F. Livingstone, From A. Stein. Eng. Pat. 24,288, Nov. 9, 1904. XVIII., page 1249.

Liquids; Evaporating — as Brewers' Wash, Sewage, Waste or Spent Dyes, and the like, the Evaporator being also applicable as a Smoke Washer. A. B. Lennox. Eng. Pat. 28,951, Dec. 30, 1904. XVIII., page 1250.

UNITED STATES PATENT.

Fermenting Apparatus. H. H. Freund, New York. U.S. Pat. 803,478, Oct. 31, 1905.

THE fermentation vessel consists of a closed tank provided with an overflow cock and a row of closable openings at a level just above the overflow cock. Means are provided for admitting and discharging the wort or beer to or from the tank, and for retaining the yeast and solid matters in the tank. There are also means for cooling the liquid in the tank, and for sterilising and filtering the air supply, which can be admitted at will either near

the bottom or top of the tank. The air-pipe which enters the tank at the bottom can be arranged to deliver either one large stream of air or a number of fine streams, and the air pipe which enters near the top is in connection with a gas-escape pipe by means of a three-way cock, a liquid seal being provided to prevent the return of the gas into the tank.—J. F. B.

FRENCH PATENTS.

Seeds and Grains; Process for Restoring Water-damaged —. M. Hecking. Fr. Pat. 355,920, June 27, 1905.

THE process of restoring damaged grain consists of three treatments—cleaning, drying and cooling. The cleaning is effected by a vigorous agitation of the grain with the application of the waste heat from the drying apparatus. The grain may be cleaned either by its own friction or by the admixture of sand or sawdust to increase the friction; in some cases a stream of water must also be employed. The drying apparatus consists of a horizontal cylinder, provided internally with means for the aëration and transport in a longitudinal direction of the grain; this may be effected either by rotating the cylinder or by providing rotatory agitators inside a stationary cylinder. The dried grain is delivered into a rotatory sieve in which it is cooled by the current of air entering the drying drum, this air is then heated, passed through the grain at a suitable speed, and discharged from the cleaning apparatus.—J. F. B.

Wort from Mash; Process and Apparatus for Extracting — by Centrifugal Action. M. Güttner and R. Baeger. Fr. Pat. 356,134, May 4, 1905.

SEE Eng. Pat. 8576 of 1905; preceding these.—T. F. B.

Beer; [Electrical] Process for Preserving —. P. A. Roche. Fr. Pat. 350,182, Sept. 17, 1904.

THE beer is subjected to the action of an electric current of low voltage, in presence of soft iron, previously oxidised. The iron is preferably supplied in the form of a bundle of sheets; the acid of the beer attacks the iron, and the salt of iron thus produced acts as a precipitating and clarifying agent. At the same time ozone is said to be produced by the action of the electric current which thus sterilises the beer.—J. F. B.

Beer; Manufacture of Sterilised —. J. F. Bergo and D. Kainseop. Fr. Pat. 355,612, June 6, 1905.

THE whole of the operations of brewing and fermentation are conducted in closed sterilised vessels, and the liquid is allowed to come in contact only with sterilised air. The malt is mashed in a closed mash-tun, and the wort is driven off by means of compressed air. The wort in the copper is first concentrated under reduced pressure and then sterilised by boiling at a temperature of 150° C., after the introduction of hops. The boiled wort is passed through a closed refrigerator into the fermentation tuns in which it is aërated with sterilised air. The primary fermentation takes place in one vessel and the secondary fermentation in another, the gases from the primary fermentation being passed into the beer undergoing secondary fermentation. Finally the beer is passed through a filter into casks protected from the air.—J. F. B.

Lactic Acid; Process for the Manufacture of —. E. A. Mislin and L. Lewin. Fr. Pat. 355,520, May 16, 1905.

ALTERNATE layers of malt and rye are placed in a suitable apparatus in equal proportions, until the saccharification of the starch is complete. The must is removed from the mass by pressure, and is then fermented with a lactic acid ferment, e.g., *acidificans longissimus*, milk of lime being added every twelve hours to keep the acidity of the liquor constant. When fermentation is complete, the solution is neutralised with lime and the calcium lactate decomposed by means of sulphuric acid.—T. F. B.

ENGLISH PATENTS.

Food [Molasses Fodder] for Animals and for other Purposes; Process for Making a Product for use as —. R. Livingstone, London. From A. Stein, Prague, Austria. Eng. Pat. 24,288, Nov. 9, 1904.

CERTAIN quantities of moss-peat and molasses or "sacchariferous liquid," are mixed together and then heated until acids and odorous matters are driven off, and the residue is dried. The latter serves as a half-product in the manufacture of alcohol. Other food materials may be added to the residual mixture.—W. P. S.

Fruits and Vegetables containing Sugar and Preparations of such Fruits and Vegetables; Drying —. J. R. Hatmaker, Paris. Eng. Pat. 25,563, Nov. 24, 1904.

THE fresh fruits or vegetables are reduced to a pulp and then dried on the hot-roller apparatus described in Eng. Pat. 8743, 1903 (this J., 1903, 815). If the drying be effected under reduced pressure, only sufficient heat to cause rapid evaporation need be employed.—W. P. S.

Liquid or Semi-liquid Substances [Milk, &c.] composed of various Constituents; Process for Making — more Homogeneous. G. Kumick, London. Eng. Pat. 28,250, Dec. 23, 1904.

WHEN a liquid, such as milk, is "homogenised" in the usual way the fat globules are not completely disintegrated. The patentee, therefore, subjects such homogenised milk to centrifugal action, whereby a fatty portion is obtained, whilst the milk, although naturally poorer in fat, still contains from 50 to 75 per cent. of its original fat. The fatty portion is then once more homogenised, either alone or with a fresh quantity of milk, and mixed with the separated milk. An alternative method is to separate the cream from the milk by means of a centrifugal machine, homogenise the cream, and re-mix it with the separated milk. The process is also applicable to egg-yolk and oil emulsions.—W. P. S.

Lard Compounds; Apparatus for Bleaching —. J. N. Humphreys, Assignor to Armstrong Packing Co., Dallas, Tex., U.S.A. U.S. Pat. 804,129, Nov. 7, 1905.

THE bleached substance is chilled by being passed between hollow inclined rollers, in contact throughout their length, and provided with inlets and outlets for the cooling agent, e.g., brine, and with rotating mechanism.—C. A. M.

Yeast Extracts; Process of Freeing — from Bitter Principles. M. Elb, Dresden, Germany. U.S. Pat. 804,524, Nov. 14, 1905.

Pepsin; Process for Converting — into a Stable, Water-soluble Product. Act.-Ges. f. Anilinfabr. Fr. Pat. 355,560, June 20, 1905.

PEPSIN is converted into stable products, easily soluble

in water, by adding to it the hydrochloride of a suitable basic substance, such as the hydrochloride of methylamine or leucine. For example, each 100 parts of pepsin (40 per cent. of combined hydrochloric acid) is obtained by incorporating three parts of powdered pepsin with two parts of betaine hydrochloride.—T. F. B.

Peptone from Silk Fibroin; Manufacture of —. Act.-Ges. f. Anilinfabr. Fr. Pat. 355,805, July 1, 1905.

Raw silk is boiled with an acid, such as sulphuric acid, capable of forming an insoluble calcium or barium salt. The acid is then precipitated from the extract, and the peptone obtained by evaporation, preferably in a vacuum.—F. S.

Fruits; Preserving —, by means of Dry Sugar. C. E. Grenard. Fr. Pat. 355,817, July 3, 1905.

THE fruits are embedded in a thick layer of dry powdered sugar to which they give up the greater part of the water contained in them. At the same time, a quantity of sugar passes through the skins into the interior of the fruits. Afterwards, the fruits are washed once, wiped, and completely dried.—W. P. S.

Butter; Process for Making —. S. C. Boykin and R. B. Mitchell. Fr. Pat. 355,837, July 3, 1905.

FRESH milk is allowed to stand until the cream has risen, and the whole is then heated to the boiling temperature. After cooling, the cream is removed, one or two small spoonfuls of sugar are added to each 560 c.c. of cream, and the mixture is allowed to ferment. When the cream becomes thick and appears to have risen, it is worked, salted and washed.—W. P. S.

GERMAN PATENTS.

Filter with Inclined Division Plates, for the Separation of Solids from Liquids [Milk]. C. Baechler. Ger. Pat. 161,170, May 6, 1903.

IN separating particles of dirt, &c., from milk, filters or separators having inclined division plates with passages alternately above and below, are used. According to the present patent, the plates, having passages at their lower ends, are bent so that the cross-section has the form of a hook. The direction of the moving liquid is thus changed, and the solid particles separate more readily and fall into the collecting troughs below.—A. S.

(B.)—SANITATION; WATER PURIFICATION.

Water; Methods used for Controlling Supplies of Drinking —, and the Significance of the Results obtained with them. F. Dienert. Ann. Inst. Pasteur, 1905, 19, 541–563; (Chem. Centr., 1905, 2, 1547–1548).

AS a means of controlling supplies of drinking water (e.g., spring water), the author recommends determination of the electric conductivity of the water and counting of the number of *Bact. coli*. The electric conductivity of some spring waters examined by the author varied only within narrow limits, viz., between 10 and 20 ohms. When, however, owing to heavy showers, impurities from the surface found their way into the springs, the conductivity increased rapidly to a maximum, afterwards falling again to its normal value. In dry weather also, the conductivity of a spring water may become greater, especially in the case of springs subject to subterranean intermittent inflow of water from doubtful sources.

FOR counting the number of *Bact. coli*, the author uses small culture flasks filled with a nutrient solution containing per 1000: 60 parts of peptone (Defresne), 60 of sodium chloride, 2.2 of phenol, and 2 parts of lactose. To different quantities of this solution are added 200 c.c. of the water to be examined, and the mixture is kept at 42° C. for 24 hours. Sub-cultures of 0.5–1 c.c. of the mixture are then prepared on Neutral Red-gelatin.—A. S.

ENGLISH PATENTS.

Sewage; Treatment and Utilisation of —. F. M. Spence and P. Spence and Sons, Ltd., Manchester. Eng. Pat. 28,646, Dec. 29, 1904.

THE invention relates to the utilisation of clayey or non-

porous land for sewage purification and concurrent crop growing. For this purpose, the land is surface-drained and is then covered with graded asphalt or lime refuse. The sludge obtained by precipitation of the sewage is also spread over the land and the effluent is used for irrigating the whole prepared surface.—W. P. S.

Liquids; Evaporating —, as *Brewers' Wash, Sewage, Waste or Spent Pyes and the Like, the Evaporator being also applicable as a Smoke Washer.* A. B. Lennox, Newcastle-on-Tyne. Eng. Pat. 28,951, Dec. 30, 1904.

THE evaporating chamber is built around a chimney or smoke-stack, an entrance for the flue gases being provided at a low level and an exit into the chimney at a higher level. The evaporating chamber is divided into a large number of compartments by baffle-plates fixed alternately to the top and the bottom of the chamber, so that the gases are forced to take a zig-zag course. In each compartment is fixed a pipe from which the liquid is discharged through a spraying nozzle. The spray of liquid thus comes in contact with the flue gases, the liquid is evaporated, and the smoke is removed from the gases.

—J. F. B.

Sewage and other Waste Waters; Removal of Floating and Suspended Matters from —, F. Bräutotte, Hamburg. Eng. Pat. 11,231, May 29, 1905.

THE apparatus consists of a number of separate gratings connected with one another so as to form an endless chain or conveyor. The bars forming the gratings extend out of the plane of the latter throughout their entire length in order to permit a clearing device to penetrate between them from end to end, and also to form recesses or intervals between the succeeding gratings. In these recesses, the coarser materials are retained and afterwards ejected as the apparatus revolves. The clearing device rocks back after the passage of one or more gratings and the material is removed from it by means of a scraper.

—W. P. S.

Sewage; Purification or Filtering of —, A. Vogel-sang, Dresden. Eng. Pat. 17,383, Aug. 28, 1905. Under Int. Conv., Sept. 1, 1904.

A BEDWORK tank is placed at any desired depth below the surface of the ground and is tightly closed at the top by an iron plate. The bottom of the tank is formed of a perforated arch providing a channel under the tank, whilst the interior of the latter is partly filled with layers of filtering material of different sizes. The layer consisting of the largest sized pieces is placed at the bottom and, at the

Mercury Compounds to be used for Medicinal, Disinfecting and Antiseptic purposes. S. Cooke, Glasgow. Eng. Pat. 1530, Jan. 26, 1905.

A COMPOUND consisting of equal parts of mercuric bromide and potassium bromide is claimed for use as a disinfectant, &c. The compound is soluble in water and does not coagulate albumin, nor form an insoluble compound when mixed with soap. Sodium or ammonium bromide may be used instead of the potassium salt.—W. P. S.

XIX.—PAPER, PASTEBOARD, Etc.

(Continued from page 1185.)

Paper as a Material for Textiles. H. P. Stevens. Paper and Pulp. 1905, 10, 656—661.

THE yarn known as "Xyloidine" is prepared from ribbons of paper unwound from spools by a differential motion which twists the ribbons as they are unwound. The twisted ribbons are then passed through two "condensers" which roll them longitudinally into threads. Later processes, such as the Kellner-Türk and Kron's "Silvaline" process, treat the paper in the moist state direct from the paper machine. In the former of these the paper is made on the cylinder machine and is divided up into ribbons by circumferential wires fixed on the making cylinder. The strips are sufficiently adherent to pass the dry end of the machine as a single web; they are then separated, rolled up longitudinally, by passing through a "condenser," and collected in cans in which they are preserved moist until ready for twisting on a ring-spindle twisting frame. The drawbacks of this process are the slow speed of the making machine and the small number of strips (80—100) obtained in the width of the machine. In Kron's process a Foudrinier machine is employed, which travels at a high speed; the web is split up into as many as 400 strips by fine jets of water (see this J., 1903, 757) applied in very close proximity to the paper, which is then reeled up moist. When the reel is unwound, the strips are separated and are twisted into yarn on the ring-spindle twisting frame. The strength of the yarn is, of course, determined by the strength of the pulp from which it is made, but the following data show that the process of twisting has a very marked influence in increasing the strength:—

	No. of metres per 1 grm. weight.	Breaking strain.	Breaking stretch.
		Kilos.	Per cent.
1. Dry strips of "Silvaline" pulp	2,891	2,390	3.06
2. Thread prepared from same	2,900	4,810	6.44
3. Strip of pulp prepared by Türk's process	13,153	4,170	2.84
4. The same rolled parallel to its length	8,222	5,014	2.24
5. The same rolled and twisted	12,100	6,413	3.06

air-outlet side of the tank, forms almost the total thickness of the bed. The sewage is admitted from a settling vessel and is distributed over the surface of the filter by means of conduits. A current of air is drawn down a shaft communicating with the channel under the filter bed, and after passing through the latter, leaves the chamber by a flue leading to a chimney. The draught up the chimney causes a continuous current to be drawn through the tank. The filtered sewage is led away by the channel under the filter. A number of similar tanks may be used in combination with a central chimney, but the main object of the invention is to provide a domestic sewage-disposal plant, the kitchen chimney supplying the necessary draught. The air may be ozonised or heated before entering the tank.—W. P. S.

(C)—DISINFECTANTS.

ENGLISH PATENTS.

Scrap or Scrap Size; Utilisation of Waste Products in the Manufacture of —, H. Arleber. Eng. Pat. 28,142, Dec. 27, 1904. XII., page 1243.

Thus the twisting of the "Silvaline" pulp hardly affects its length, whilst it doubles its strength and elasticity, but the rolling and twisting of the Türk pulp reduce its length very considerably.—J. F. B.

Papers; Printing — for Cheap Illustrations [Mechanical Wood-Pulp]. C. Hofman. Papier-Zeit., 1905, 30, 3374.

For illustration papers containing mechanical wood-pulp the first consideration is the selection of a suitable quality of pulp. This should be short-fibred and "wet," such as is obtained by the use of fine-grained blunt stones; it must be well refined and very finely strained. The whitest pulp is got from freshly felled wood, but even then a chemical bleaching process is necessary. For this purpose 10 kilos. of sodium bisulphite solution at 40° B. and one litre of concentrated sulphuric acid are generally allowed for 100 kilos. of dry pulp. The diluted bleaching liquor is best applied to the pulp on the *presse-pâte*, by spraying it uniformly over the web before the latter passes the press rolls. The pulp is then stacked moist, in sheets,

and becomes bleached ready for use in about six days. There is an increasing demand for illustration papers of low specific gravity; such papers are prepared without mineral filling, the absence of which must be compensated by extra attention to the fineness and whiteness of the pulp. These bulky papers are made with Rüter-Kellner wood pulp in combination with well bleached mechanical pulp from aspen wood.—J. F. B.

Papers; Hard Sized or Strong Packing — C. Hofmann. *Papier-Zeit.*, 1905, 30, 3584.

It is pointed out that in the case of wrapping papers it is impossible to combine the maximum hardness of sizing (resistance to rain, &c.) with the maximum tensile strength. The increased proportion of size has the effect of lowering the tensile strength of the paper. Consumers should therefore decide which quality is most important for the purpose for which the paper is required, and should determine some mean limits which shall secure sufficient resistance in both respects.—J. F. B.

Paper; Lead Foil — C. Beadle. *Paper and Pulp*, 1905, 10, 661–662.

THERE is a demand in Russia for paper coated with lead for packing tea, similar to the tin-coated paper used in this country. Experiments, made by Weichert with the object of preparing a finely divided metallic lead powder for coating paper, failed owing to the tendency of the lead to coagulate into lumps. Successful results were, however, obtained by using a mixture of lead and tin prepared as follows:—Three parts of a concentrated solution of lead acetate are mixed with one part of a concentrated solution of stannous chloride; a white precipitate is thus formed which redissolves on shaking. The solution is then placed in contact with strips of sheet zinc, which gradually dissolve, causing the separation of a spongy mass of lead and tin. This preparation does not tend to form clots and may be washed with water, incorporated with starch paste, and applied to the paper. Such paper, when passed through friction rolls slightly greased with coconut oil, takes a fine metallic polish.—J. F. B.

Cellulose Acetosulphates. II. C. F. Cross, E. J. Bevan and J. F. Briggs. *Ber.* 1905, 38, 3531–3538.

THESE investigations confirm, in the main, the account given in the first paper (this J. 1905, 685). The sulphuric acid residue of these esters is, however, now recognised as, if not existing in the form of $-SO_3H$, certainly so reacting in presence of water, and, therefore, capable of combining with the bases present in hard water. The bodies previously described as neutral sulphuric esters were purified by methods which are current for the production of the ordinary acetates and were, in fact, the calcium salts of acetyl-cellulose sulphuric acids. The corresponding magnesium and zinc salts have now been prepared and analysed, and the proportions of the respective bases fixed correspond to half the equivalent of the total sulphuric acid in combination. The magnesium salts are neutral bodies, which, after drying in the air, can be heated at 100° C. without decomposition. The zinc salts on the other hand, after washing until neutral, split off free sulphuric acid when dried in the air and are completely charred when heated at 100° C. The free "acid esters" gradually dissociate and break up in contact with water free from dissolved bases, but they have been prepared by washing the product of the reaction with amyl alcohol. Prepared without contact with water, these esters can be dried at 100° C. without charring, but they react as free acetyl-cellulose sulphuric acids when titrated in presence of water or alcohol. These investigations illustrate the relatively great stability of the combination between cellulose and sulphuric acid towards alkaline saponifying agents and its extreme sensitiveness towards acid reagents including water. The relation of sulphuric esters of this type to the question of the stability of cellulose nitrates is discussed (compare Hake and Lewis, this J., 1905, 274), and it is remarked that when cellulose nitrates are treated with the sulphuric acid acetylating mixture, a series of mixed esters, containing nitric, acetyl and sulphuric groups, in every way analogous to the above bodies, is produced.—J. F. B.

ENGLISH PATENTS.

Paper Making (Pulp Concentrating Apparatus P. Cooper, Flint. Eng. Pat. 2774, Feb. 10, 1905.

THE apparatus for solidifying or concentrating paper pulp in the course of manufacture consists of a drum with a foraminous surface, e.g. of wire gauze, rotating in a stationary outer casing; a feed pipe with contracted mouth-piece in connection with a centrifugal pump, delivers the fluid pulp with force against the meshes of the drum, with which the mouth-piece is in close proximity. The fibres are retained on the drum, whilst the water penetrates to the interior, where it is collected and discharged by buckets, partitions, troughs or other suitable means. The layer of pulp is pressed on the drum by means of an external roller revolving in contact with it and is then removed by scrapers and delivered into a suitable receptacle. This apparatus is used for concentrating the pulp before and after bleaching, and replaces the *presse-pâte* for collecting the washed half-stuff.—J. F. B.

Paper; Manufacture of Marbled — O. Imray, London. From K. Franz, Hoechst a/Main, Germany. Eng. Pat. 3799, Feb. 23, 1905.

WHEN certain so-called "harsh" pulps, e.g., those prepared from wood cellulose, are delivered on to the paper-making machine, they part with their water very quickly, leaving the fibrous constituents in the form of irregularly distributed elevations or depressions. A marbled dyeing effect is obtained on such pulps by placing a vessel containing the solution of dyestuff immediately behind the skimming boards or "sluices" and delivering the solution on to a fabric suspended above the pulp in such a manner as just to brush against the elevations of the web of pulp as it passes beneath it. The irregular elevations are thus coloured differentially, as compared with the rest of the sheet, whilst the whole sheet is subsequently compacted and smoothed on passing the vacuum boxes and press-rolls.—J. F. B.

Cellulose; Process of Manufacturing Films or Threads of — M. Fremery, Oberbruch, and E. Bronnert, Mülhausen-Niedermorschweiler, Germany, and J. Urban, St. Pölten, Austria-Hungary. U.S. Pat. 801,191, Nov. 7, 1905.

A solution of cellulose cuprammonium is coagulated by means of a strong caustic soda solution, and the solid product is treated in a centrifugal machine with a cold solution containing not less than 20 per cent. of caustic soda and not more than 6 per cent. of ammonia. It is then washed and dried under tension.—T. F. B.

FRENCH PATENTS.

Size; Process and Apparatus for Making Liquid — by Means of a Solution of Rosin Soap. M. Erfurt. Second Addition, dated June 5, 1905, to Fr. Pat. 325,901, Oct. 24, 1902 (this J., 1903, 757).

THE apparatus is shown in the accompanying diagram:

(a) represents barrels of soap, (b) a tank of rosin soap, (c) a measuring tank, (d) a steam pipe, (f) steam pipes to heat the rosin soap in (b) and (e); (g) is an injector fed by steam through (g¹) from (c), by soap through (g²) from (c), and by hot water through (g³) from (k); the mixture is forced by the injector through the tube (h) into the tank (i). The emulsion may be run from (h) to a measuring tank (j). In the original patent the injector was placed on the same level as the tank (h). According to this addition it may be placed 5 m. or more lower than (h).—W. B. H.

Paper Pulp; Solid Material [Rosin Soap] for Sizing —. Soc. anon. "Mirabet." Fr. Pat. 355,852, July 4, 1905. Under Int. Conv., May 5, 1905.

The rosin is saponified in the usual way by heating it with sodium carbonate in open boilers; the soap thus produced is then evaporated to dryness by any suitable process. The product is a solid, pulverulent, dry material, soluble in cold water, and suitable for preparing size.—J. F. B.

Cellulose and Copper Compounds; Manufacture of Artificial Threads composed of —. A. W. Kracht. Fr. Pat. 355,064, May 1, 1905. V., page 1226.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

(Continued from page 1189.)

Indaconitine, the Alkaloid of Aconitum Chasmanthum; Contributions to our Knowledge of the Aconite Alkaloids. Part XVI. W. R. Dunstan and A. E. Andrews. Chem. Soc. Proc., 1905, 21, 233—234.

INDACONITINE is a highly poisonous alkaloid which has been obtained from the Indian plant known as "mohri," at first thought to be the same as the European *Aconitum Napellus*, but now recognised as a distinct species, *Aconitum chasmanthum*.

Indaconitine (C₃₇H₄₇O₁₀N) is a crystalline alkaloid very closely resembling aconitine from *Aconitum Napellus* in its general properties, but differing, however, in its habit of

crystallisation and in many of its physical properties. Most of the salts crystallise well and are distinct from the corresponding aconitine salts. Its physiological action has been shown to closely resemble that of aconitine and pseudaconitine (Cash and Dunstan, Roy. Soc. Proc., 1905).

Indaconitine undergoes hydrolysis in two stages, in the first of which an acetyl group is eliminated as acetic acid, with the formation of a base, indbenzaconine, which has not been crystallised, but furnishes crystalline salts. This hydrolysis is represented by the equation:

Indbenzaconine is practically non-poisonous. On further hydrolysis, indbenzaconine furnishes benzoic acid and pseudaconitine identical with the final hydrolytic product of pseudaconitine.

Indaconitine is therefore of interest as representing a type of highly toxic alkaloid intermediate in its properties between the aconitine of the common European aconite (*A. Napellus*) and the pseudaconitine derived from the Indian aconite of Nepal. The discovery of this alkaloid and its proximate constitution has led the authors to change the formula of pseudaconitine from C₃₆H₄₉O₁₂N, the formula originally assigned to the alkaloid by Wright, to C₃₆H₅₁O₁₂N.

Bikhaconitine, the Alkaloid of Aconitum spicatum; Contributions to our Knowledge of the Aconite Alkaloids. Part XVII. By W. R. Dunstan and A. E. Andrews. Chem. Soc. Proc., 1905, 21, 234—235.

THIS alkaloid, like indaconitine, is highly poisonous. It has been isolated from a supposed variety of *Aconitum ferox* of India, which has now been proved to be a distinct species, *Aconitum spicatum*. The vernacular name of the plant being "bikh," the name bikhaconitine is proposed for the new base.

Bikhaconitine (C₃₆H₅₁O₁₁N) does not crystallise so readily as other "aconitines," and its physical properties are distinct. A number of its salts have been prepared, and most of them crystallise well. Its physiological action very nearly resembles that of the other aconitines: its toxicity towards warm-blooded animals is greater than that of either aconitine or japaconitine, but is slightly inferior to that of pseudaconitine, which is the most poisonous alkaloid of the group.

Bikhaconitine, like the other aconitines, undergoes hydrolysis in two stages. In the first of these, an acetyl group is eliminated as acetic acid, and a new base (veratroylbikhaconine) is formed. This alkaloid does not crystallise, but furnishes crystalline salts. On further hydrolysis, veratroylbikhaconine furnishes veratric acid and bikhaconine, which does not crystallise, but furnishes crystalline salts. This alkaloid differs from other "aconitines" previously described.

The formula of bikhaconitine differs from that of pseudaconitine by one atom of oxygen.

Aconitine Group of Alkaloids; Contributions to our Knowledge of the Aconite Alkaloids. Part XVIII. By W. R. Dunstan and T. A. Henry. Chem. Soc. Proc., 1905, 21, 235.

It is pointed out that now that it has been established that closely-related Indian aconites furnish similar, but nevertheless quite distinct, toxic alkaloids, it is most desirable that a similar examination should be made of the European aconites of the type of *Aconitum Napellus*. The work of Wright, Jurgens, and other chemists, as well as that of the present investigators, renders it highly probable that an examination of European plants commonly classed as *Aconitum Napellus* will reveal the presence of alkaloids very closely resembling, but yet distinct from, aconitine. The evidence already recorded goes to show that the aconitine, isolated by Wright from English plants and analysed by him and others, which was described in the course of the present investigation, is a distinct substance from the aconitine of German origin, now an article of commerce.

Calycanthus Glaucus; The Crystalline Alkaloid of —. H. M. Gordin. J. Amer. Chem. Soc., 1905, 27, 1418—1429.

In continuation of a former paper (this J., 1905, 289).

the preparation and properties of the following salts of calycanthine are described:—Nitrate, normal and acid sulphates, chlorurate, picrate, and normal oxalate. An acid oxalate could not be obtained, but an "abnormal" oxalate, corresponding to a mixture of 3 mols. of the acid oxalate with 1 mol. of the base, was isolated. A double salt of 3 mols. of calycanthine hydrochloride with 2 mols. of mercuric chloride was also obtained. The tartrates could not be obtained in a pure state. One of the nitrogen atoms of calycanthine is secondary, as shown by the formation of a nitrosamine $C_{11}H_{13}N_2NO$, which is described; it exhibits Liebermann's reaction, and gives a brilliant green coloration when warmed with hydrochloric acid and methyl alcohol. Calycanthine contains one methyl group attached to a nitrogen atom.—T. F. B.

Odorous Principles: Formation of —, during the Growth of the Plant. E. Charabot and A. Hébert. *Comptes rend.*, 1905, **141**, 772–774.

The authors have carried out experiments similar to those described previously in the case of peppermint (this J., 1904, 454), but in this instance the plant employed was sweet basil (*Ocimum basilicum*), an aromatic pot-herb. The results show that plants which have been deprived of their flower buds produce appreciably more essential oil than plants allowed to grow naturally, the increase of oil obtained amounting to about 82 per cent. The weight of the plant was also increased by about 39 per cent. Fecundation and fructification are therefore accompanied by a consumption of the odorous principles of the plant.—W. P. S.

Distillation of Immiscible Liquids [Steam Distillation of Essential Oils]. C. v. Rechenberg and W. Weisswange. *J. prakt. Chem.*, 1905, **72**, 478–488. (See this J., 1904, 628.)

The formula $\frac{P}{P^1} = \frac{M \cdot F}{M^1 \cdot F^1}$ only holds good when the mixture

of vapours is saturated for both its components. In actual practice, as in the essential oil industry, this condition is not realised. When the distillation is so conducted that the vapour of the essential oil is saturated and the steam unsaturated, the proportions in the distillate

are expressed by $\frac{P}{P^1} = \frac{M \cdot t}{M^1 \cdot (T-t)}$ where M and M¹ are the mole-

cular weights of oil and water respectively, T the tension of the mixed vapours, and t that of the oil contained in the vapours. This formula agrees with the experiments of the authors, who fail to confirm the formula of Charabot and Rocherolles (this J., 1904, 628), and, moreover, regard it as theoretically unsound. The converse relation $\frac{P}{P^1} = \frac{M \cdot t}{M^1 \cdot (T-t)}$ —where t¹ is the tension of the steam, holds

when the vapour of the essential oil is unsaturated. The former condition obtains when oils or parts of plants are distilled in a rapid current of steam, the latter when an excess of oil is heated from outside and steam passed through.—W. A. C.

Liverworts; Essential Oils of the —. K. Müller. *Z. physiol. Chem.*, 1905, **45**, 299–319. *Chem. Centr.*, 1905, **2**, 768–770.

The author examined the essential oils yielded by different species of *Jungermanniaceae*:—

(1) *Mastigobryum trilobatum* (L.).—This plant loses 90 per cent. of its weight on drying in the air. On steam distillation it yields 0.93 per cent. (on the weight of dry substance) of an orange-yellow essential oil. A specimen of the oil prepared by the author had the sp. gr. 0.975 at 12° C., as compared with 0.945–0.947 at 15° C. for a commercial oil; $[a]_D = +12.88$ when the oil itself was examined, and $+14.05^\circ$ when the determination was made with a 42.26 per cent. solution in alcohol; saponification value, 5.4. The oil does not contain any volatile acids, but, after saponification with alcoholic potash, yields small quantities of an acid, semi-solid at the ordinary temperature, from which a white lead salt, soluble in ether, can be prepared. On fractionation, the chief

quantity of the oil distills at 260–270° C.; the distillate has a bluish-green colour; sp. gr. at 20° C., 0.946; $[a]_D = +25.59$. The higher body fraction (270–285° C.) contains 5.4 per cent. of oxygen and has $[a]_D = +42.21$. The fraction distilling at 290–270° C. probably consists of a terpene; on oxidation with chromic anhydride and glacial acetic acid, it yields a compound boiling at 230° C., and having the composition $C_{10}H_{16}O$.

(2) *Leiosephus Taylori* (Hook.) This moss, after drying at 100° C., yields 1.6 per cent. of a thick, bluish-green oil, of intense odour and unpleasing taste. The oil has the sp. gr. 0.978–0.986 at 20° C.; $[a]_D = +34.4$; saponification value, 11.4. On distillation, the first fraction is obtained between 260 and 265° C.; it has the sp. gr. 0.937 and probably contains a sesquiterpene alcohol. The fraction distilling between 265 and 278° C. probably contains a sesquiterpene. The portion boiling at 280–290° C. is of a dark blue colour, and has $[a]_D = +26.88$; it has the composition $C_{15}H_{26}O$.

(3) *Malthesia brigitata* (Schrödt.).—The air-dried material yields 0.9 per cent. of a relatively thin orange-yellow oil having a pleasant odour. The oil has the sp. gr. 0.856 at 16° C., $[a]_D = +72.74$; saponification value, 5.56. On distillation the following fractions are obtained:—(1) 50–100° C. (25 mm.), $[a]_D = +10.51$, unpleasing smell; (2) 150–160° (17 mm.), sp. gr. 0.668 at 15° C., $[a]_D = +132.23$, boils with decomposition at 280° C. under atmospheric pressure.

(4) *Alicularia scalaris* (Corda).—The oil from this moss has a lemon-yellow colour and has the sp. gr. 0.865 at 15° C., and $[a]_D = -33.49$.—A. S.

Ethyl Alcohol; Preparation of Pure —. L. W. Winkler. *Ber.*, 1905, **38**, 3612–3616.

THE impurities to be removed from commercial absolute alcohol are aldehyde and 1–2 per cent. of water. The aldehyde is removed by oxidation by means of precipitated silver oxide in presence of caustic alkali. A few grams of dried silver oxide are ground in a mortar with a little of the alcohol and the mixture is added to a litre of alcohol containing 1–2 grms. of caustic alkali. The silver oxide is allowed to act upon the spirit with frequent agitation at the ordinary temperature, for a few days, until the presence of aldehyde can no longer be detected. The removal of the water is effected by the action of metallic calcium in the form of filings. The alcohol is heated for several hours with 2 per cent. of calcium in a distillation flask with a long neck connected with a condenser by a short piece of india-rubber tube. After the evolution of hydrogen has almost ceased, the alcohol is distilled off; it should have a strength of 99.9 per cent. In order to make it perfectly anhydrous, the alcohol should be heated again for one hour with a small quantity of calcium and re-distilled. If the first runnings have a strange odour they should be rejected; the receiver should be protected from the entrance of atmospheric moisture by means of a calcium chloride tube.

Specific Gravity and Boiling Point of Pure Alcohol.—The author has made a series of careful determinations of the specific gravity of pure alcohol at temperatures between 0° and 30° C. From these observations the following formula has been deduced, showing the specific gravity of alcohol *in vacuo* compared with water at 4° C.:—

Sp. gr. (0–30° C.) = $0.80629 - 0.000838t + 0.000004t^2$. These values agree with those of Mendeleeff up to 15° C., above which temperature they are slightly lower than those of the latter author.

The boiling points of pure alcohol for different barometric pressures are: 740 mm., 77.69° C.; 745 mm., 77.86°; 750 mm., 78.03°; 755 mm., 78.20°; 760 mm., 78.37°; and 765 mm., 78.54° C.

It is remarked that the hygroscopicity of anhydrous alcohol has been somewhat exaggerated: 200 c.c. of alcohol, after standing exposed in an open beaker for fifteen minutes, had not absorbed 0.1 per cent. of water.

—J. F. B.

Iodoform from Acetone [Electrolytic Production of —]. G. A. Roush. *Amer. Electrochem. Soc.*, Sept. 20, 1905. *Electrochem. and Metall. Ind.*, 1905, **3**, 383–4. THE electrolysis of potassium iodide and acetone without

a diaphragm produces 2 mols. of alkali for each mol. of iodoform produced, whilst with a diaphragm, 4 mols. of acid are obtained to each mol. of iodoform. It is now proposed to combine these two reactions. The apparatus used consisted of a glass cell of 350—400 c.c. capacity; the anode was a platinum crucible, presenting 15—20 sq. cm. of electrode surface; it was mounted on a rod, which could be rotated. Two cathodes were used, one consisting of a platinum wire, of which about 10 cm. was immersed in the electrolyte, and the other of copper gauze of about 100 sq. cm. surface, the latter being in a porous pot. Each cathode was connected to a separate resistance, so that the current flowing from the anode to each could be regulated. Theoretically, the current to the copper cathode should be one-half that to the platinum, but, since the solution is best kept acid, a ratio of about 2:3 was maintained. The following conditions were found to give at the same time the highest current efficiency and the highest iodoform yield:—Electrolyte, 20 grms. of potassium iodide, 1.5 c.c. of acetone, 300 c.c. of water; current, to platinum cathode, 1.5 amp., and to copper cathode, 1.0 amp.; temperature, 15° to 18° C.—T. F. B.

Calomel; New Modification of ——. J. Meyer. Z. anorg. Chem., 1905, 47, 399—400.

THE author added to a solution of mercuric chloride a solution of lithium sulphite, with the view of preparing lithium mercurisulphite. An immediate precipitate of ordinary calomel was formed and was filtered off. After twenty-four hours the still clear filtrate was gradually warmed to 70° C., when shining plates formed, and settled on cooling. These were filtered off, and analysis showed them to be, not lithium mercurisulphite, as was expected, but calomel. Even when dried they are light and bulky compared with ordinary calomel (sp. gr. 4.5—5.0, against 6.5—7.5). They are not an allotropic form of calomel, for they show no E.M.F. when a galvanic element is formed from the two substances, but differ from it only physically. The new form is exceedingly pure, is very readily powdered, and may possibly be substituted with advantage for the other in pharmacy. It seems to resemble the Japanese calomel described by Lunge and by Byers. —J. T. D.

Chloroform; Process for Preserving —— from Air and Light, and for Eventually Indicating its Decomposition. P. J. Breteau. First Addition, dated June 30, 1905, to Fr. Pat. 353,858, May 2, 1905.

THE following substances are given as "preservatives" of chloroform in addition to those given in the principal patent (this J., 1905, 1083):—Ethyl alcohol and ethyl ethers, nitrobenzene, methyl and amyl salicylates, thymol, coniferin. As "indicators," cellulose and gelatin may be used, in addition to dyestuffs. The indicator may also consist of a dyestuff which changes colour in presence of the decomposition products of chloroform.—T. F. B.

Lactic Acid; Process for Making ——. E. A. Mislin and L. Lewin. Fr. Pat. 355,520, May 16, 1905. XVII., page 1243.

Acetylene; Chlorination of ——. Salzbbergwerk, Neu Stassfurt. Fr. Pat. 355,776, June 30, 1905.

ACETYLENE can be safely chlorinated by allowing it to act on a mixture of sulphur chloride and a catalyst such as iron, ferric compounds, &c. To produce tetrachlorethane, it is best to saturate the mixture of sulphur chloride and the catalyst with acetylene cooling if necessary. The tetrachlorethane is obtained by fractionation. If the mixture, after being saturated with acetylene, is saturated with chlorine at a boiling temperature, hexachlorethane separates on cooling.—F. S.

Fats and Oils containing Iodine and Sulphur; Process of Making ——. W. Loebell. Fr. Pat. 355,864, July 4, 1905.

SEE Eng. Pat. 27,195 of 1904; this J., 1905, 857.—T. F. B.

Dialkylmalonylureas; Process of Preparing ——. W. Traube. Fr. Pat. 355,933, July 5, 1905. Under Int. Conv., July 13, 1904.

GERMAN PATENT.

C-C-Dialkyl-2,4-Diimino-6-Oxypyrimidines; Process for Preparing ——. E. Merck. Ger. Pat. 162,657, Nov. 10, 1903.

DIALKYLCYANOACETIC esters and guanidine are condensed by means of an alkali amide or alkali metal to form dialkyl-2,4-diimino-6-oxypyrimidines. (Compare Eng. Pat. 22,126 of 1904; this J., 1905, 689.)—T. F. B.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

(Continued from page 1190.)

Sensitising Plates by Bathing. E. König. Phot. Kor., Sept., 1905. Through Phot. J., 1905, 45, 376.

PHOTOGRAPHIC plates bathed with a solution of a dyestuff are more sensitive than those coated with an emulsion containing the dyestuff. It is necessary to use ammonia with certain dyestuffs to obtain their full sensitising power. When using ammonia in conjunction with Pinachrome or Orthochrome, only certain makes of plate can be used, but, without ammonia, all brands of plate appear to be available. Other alkalis may be substituted for ammonia; for instance, a 1 per cent. solution of potassium carbonate gives greater red sensitiveness. If 1 per cent. of ammonium chloride or sodium chloride be added to the Pinachrome solution, greater sensitiveness results; the alkali sulphates are without effect.—T. F. B.

ENGLISH PATENTS.

Developing Photographic Images; Means for ——. P. Mercier, Paris. Eng. Pat. 11,452, May 31, 1905.

THE shade of prints produced by developing under-exposed "printing-out" papers is stated to be modified by the addition to the developer of aluminium sulphate or an alum, or other sulphate which forms a double sulphate with potassium sulphate (e.g., manganese or indium sulphate). This is stated to give violet and blue prints. Instead of the normal sulphite, sodium bisulphite may be added to the developer, or an acid may be added to the developer containing the normal sulphite, to convert it wholly into bisulphite, and leaving no excess of acid.—T. F. B.

Engraving and (or) Etching of Copper Rolls for Calico Printing; Impts. in ——. D. C. Paterson. Eng. Pat. 27,222, Dec. 14, 1904. V., page 1225.

UNITED STATES PATENTS.

Photographic Process and Product. G. N. Pifer, Cleveland, Ohio. U.S. Pat. 804,038, Nov. 7, 1905.

A PLATE having interposed between the support and the

film a substance or layer which is transparent to transmitted light, but opaque to reflected light (e.g., a line screen), is exposed in the usual way, the support towards the lens, and is developed in the usual way and converted into a positive, e.g., by the action of a developer on the picture which have been acted upon by light, and converting the portions which have not been acted upon to sulphate. The product is thus a positive picture both as regards position and light and shade.—T. F. B.

Photographic Plate or Film. G. N. Pifer, Cleveland, Ohio. U.S. Pat. 804,039, Nov. 7, 1905.

THE plate or film is of the nature detailed in the preceding abstract; the intermediate layer may be of a substance which possesses the above properties, or which is capable of developing those properties during the subsequent operations.—T. F. B.

Cellulose; Process of Manufacturing Films or Threads of ——. M. Fremery, E. Broumet and J. Urbat. U.S. Pat. 804,191, Nov. 7, 1905. XIX., page 1251.

FRENCH PATENTS.

Fibres, Films, Blocks or Plates; Transparent Plastic Product for the Manufacture of ——. H. C. M. L. Cathelineau and A. A. R. Fleury. Addition, dated June 8, 1905, to Fr. Pat. 354,942, June 5, 1905. V., page 1226.

Photographs on Silver Chloride Paper; Printing and Developing ——. H. J. Mallabar. Fr. Pat. 355,790, July 1, 1905.

PRINTS are obtained on silver chloride papers without toning by development with a solution containing an organic developer, citric or tartaric acid, an alkali bichromate, and an alkali cyanide, thiocyanate or iodide. The photographs are printed to about one-third of the usual depth. The developer may consist of pyrogallol, 0.25 grm.; potassium bichromate, 0.002 grm.; anhydrous potassium thiocyanate, 0.016 grm.; anhydrous citric acid, 0.06 grm.; water, 150 c.c. Development is complete in about one minute, when the prints are fixed in "hypo," as usual. The claims also cover the use of a developer such as is described above, in the form of tablets, one lot of tablets being composed of pyrogallol, and the second of the three other components. The tones produced are generally black, but by using excess of thiocyanate, browns and reds may be obtained.—T. F. B.

XXII.—EXPLOSIVES, MATCHES, Etc.

(Continued from page 1190.)

Explosion of Nitroglycerin; Circumstances Attending an —, which Occurred in the Filter's Shop of the Factory of the "Explosive and Chemical Products, Ltd." at Bramble Island, in the County of Essex, on July 11, 1905. By Captain M. B. Lloyd, H.M. Inspector of Explosives.

A WORKMAN was engaged in renewing the gauze of two copper gauze sieves for retaining the salt in the filter in the washing house; and, having removed the old gauze, was tinning one of the brass frames preparatory to soldering on the new gauze, when an explosion occurred, blowing pieces of the frame through his body. The sieves had previously been washed, first with methylated spirits, then with caustic soda, and finally four times with hot water. It appears, however, that although the brass rim of one of the sieves was solid, the other was made of brass tubing of 12 mm. outside and 9 mm. inside diameter. By constant wear, pinholes had formed, which allowed nitroglycerin to accumulate in the interior of the tube; and since there was nothing to show that the rim was not solid, its presence was unsuspected.

Attention is called to the necessity of apparatus of this kind being so constructed that there is no difficulty in cleansing it both inside and out. The use of tubing should be avoided as far as possible, and, where unavoidable, large holes should be left which would indicate the existence of the hollow space, and facilitate its complete cleansing.

Match Igniting Compositions: Analysis of —.
C. Bender. XXIII., page 1257.

ENGLISH PATENTS.

Explosives; Impts. in —. L. Lheure, Paris. Eng. Pat. 27,459, Dec. 16, 1904.

CLAIM is made for the use as an explosive of ammonium nitrate by itself, or for its use as the base of an explosive, especially in mines, on account of its low temperature of detonation. To effect detonation, a priming core is employed, extending throughout the charge, ignition being produced from without by means of a fulminate detonator or a fuse of small diameter. The charge may be used either as powder, crystals, or compressed pellets; but to ensure success the whole must be very carefully tamped. In this way explosives not usually regarded as sensitive may also be detonated.—B. J. S.

Explosives; Impts. in — and to the Priming of the same. L. Lheure, Paris. Eng. Pat. 27,460, Dec. 16, 1904.

THE invention consists essentially in priming by means of a detonating fuse which extends through the middle of the charge, and is fired from without by means of a fulminate detonator or another detonating fuse. By this means, it is claimed that complete detonation of the charge is assured, and the danger attendant on the presence of a fulminate detonator within the charge during the process of tamping is minimised.—B. J. S.

Explosives; Manufacture of —. J. C. Gonsalves, Colombo, Ceylon. Eng. Pat. 4968, March 9, 1905.

NITROGLYCERIN is absorbed by cocoa-nut fibre (coir dust or "poonac"), the quantity being dependent on the size and quality of the fibre. By selecting fibres of different coarseness the power of the resulting explosive can be varied at will. In addition to this, the fibre prevents freezing of the nitroglycerin, and, owing to its own combustible nature, it prevents or lessens the formation of noxious fumes on explosion. Mixtures of gelatinised nitroglycerin, coir dust and nitre or barium nitrate, are suggested. The invention also comprises the use of a solution of shellac in methyl alcohol during the process of incorporation, as a binding agent.—B. J. S.

Explosive; Manufacture of a New Safety —. G. Schultz and F. Gehre, Munchen, Germany. Eng. Pat. 5687, March 18, 1905.

SEE FR. PAT. 352,990 of 1905: this J., 1905, 1032.—T. F. B.

Explosive Coherer-powder. F. Schneider, Langenfeld, Germany. Eng. Pat. 17,741, Sept. 1, 1905. Under Int. Conv., Oct. 27, 1904.

THE coherer filling is for use with blasting or mine apparatus, the detonating action of which is effected by spark-producing stations.

The metallic coherer-powders at present in use have the disadvantage of being good electric conductors: this is remedied by the addition of gunpowder or blasting powder, which, being a bad conductor, ignites when a current is passed through the coherer.—T. F. B.

Explosives Containing Nitroglycerin: Process for the Preparation of —. Deutsche Sprengstoff Act.-Ges. Fr. Pat. 355,844, July 3, 1905.

SUBSTANCES previously suggested for preventing the freezing of nitroglycerin or nitroglycerin explosives have failed owing to the fact that they are not efficacious, or that they diminish the power of the explosive. Claim is made for the use of dinitromonochlorhydrin, which, when added to the nitroglycerin up to 20 per cent., overcomes these difficulties. It may also be introduced by mixing monochlorhydrin with the glycerin before nitration.
—B. J. S.

Matches: Inflammable Paste for — of all kinds, both of Wood and Wax. W. Bokmayer and A. Swoboda. Fr. Pat. 355,846, July 4, 1905.

IT is claimed that the danger of explosion during the preparation of match composition may be minimised by

addition to the paste of the following mixture:—3 parts by weight of finely powdered cork, 15 parts of oxide of iron, 23 parts of flour and about 40 parts of water. In practice, 30 parts of gum arabic are dissolved in 40 parts of water, and to the solution are added 57 parts of powdered potassium chlorate, and when this is well distributed, 7 parts of amorphous phosphorus and 15 parts of powdered glass are stirred in. The above mixture is then immediately introduced, and when mixing is complete, the composition can be applied to wooden sticks, which need not have been previously dried or paraffined. The head of the match is finally coated with tallow, which prevents atmospheric action and also spontaneous ignition.

XXIII.—ANALYTICAL CHEMISTRY.

(Continued from page 1193.)

INORGANIC—QUALITATIVE.

Copper; Microchemical Reaction for — in presence of Lead and Bismuth. P. A. Meerburg and H. Filippo. Chem. Weekblad., 1905, 2, 641—643. Chem. Centr., 1905, 2, 1466.

IT is stated that 0.0001 mgrm. of copper can be detected in the microchemical way by adding caesium chloride, CsCl, to a hydrochloric acid solution of a copper salt. On addition of only a small quantity of caesium chloride, there are formed, besides colourless compounds, red crystals (probably $\text{CuCl}_2 \cdot \text{CsCl}$) generally needle-shaped, but frequently also hexagonal prisms. On adding more caesium chloride, yellow crystals (probably $\text{CuCl}_2 \cdot 2\text{CsCl}$) are formed, which can be re-converted into the red ones by the addition of a small quantity of cupric chloride. The presence of iron and cobalt interferes with the reaction. Lead and bismuth have no influence, and if these two metals are present together with copper, the bismuth can be detected by means of Behrens' method, simultaneously with the detection of copper by the method described above, whilst the lead can afterwards be identified as caesium-lead-copper nitrite.—A. S.

INORGANIC—QUANTITATIVE.

Ammonium Salts: Volumetric Determination of — by means of Alkali Hypobromite. E. Rupp and E. Roessler. Arch. der Pharm., 1905, 243, 104—114.

A SUITABLE volume of a solution of the ammonium salt is added to a known volume, for example, 75 c.c. of an alkaline solution of alkali hypobromite (10 grms. of sodium hydroxide, 17 grms. of bromine and 500 c.c. of water) in a stoppered glass vessel. The amount of hypobromite solution should be such that from one-third to one-half remains in excess. After shaking and allowing to stand for 5—10 minutes, about 50 c.c. of water are added, the solution is acidified with hydrochloric acid, potassium iodide added, and, after two minutes, the separated iodine determined by titration. Free ammonia may be determined by adding slowly a very dilute solution of it to the hypobromite solution, and then running in, drop by drop, dilute hydrochloric acid, until the solution contains a trace of free acid, this point being indicated by the solution acquiring a faint yellow tinge. After five minutes, the determination is completed as described above.—A. S.

Silicate Analysis. E. Jordis and W. Ludewig. Z. anorg. Chem., 1905, 45, 362—367; 47, 180—189.

THE authors have adopted the following as the most satisfactory method for the determination of silicic acid in silicates. The sample is evaporated to dryness with hydrochloric acid and ignited three times in succession, and then taken up with water and evaporated to dryness twice, in order to remove mineral acids. The platinum dish containing the residue is then heated for two hours at 140° C. in a drying oven, and the cooled contents moistened with lukewarm water, the dish being covered with a watch-glass. The moist mass is warmed gradually

on the water-bath, washed four times with hot water by decantation, and then twelve times with hot water on the filter, to free it from chlorine. The amount of silicic acid which passes through the filter is, in some cases, considerable. With pure barium silicates it was very small; with strontium silicates, 0.5; and with calcium silicates up to 12 per cent. of the weight of the sample. The amount is still greater in presence of alkalis. From the filtrate, barium or strontium is precipitated as sulphate, and calcium as oxalate. The solution, after separation of the alkaline-earth metal and still containing some silicic acid, is evaporated to dryness, and the residue treated as described above to recover the silica, the alkali metals being subsequently determined as sulphates. —A. S.

Mercury [in Ores, &c.]; Volumetric and Gasometric Determination of — by Hydrazine Salts, and Determination of Hydrazine by Mercury Salts. E. Ebler. Z. anorg. Chem., 1905, 47, 377—385.

MERCURY salts in mineral acid solution are not reduced by hydroxylamine or hydrazine, but in acetic acid or ammoniacal solution, the mercury is completely precipitated.

In acetic acid solution.—The mercuric salt is dissolved in 10 c.c. of dilute hydrochloric acid, 5 grms. of sodium acetate dissolved in 10 c.c. of water are added, and the whole introduced into a flask (500—700 c.c.) fitted with a ground stopper carrying (i.) a tap-funnel; (ii.) a tube passing to the bottom of the flask, for the introduction of carbon dioxide; (iii.) a reflux condenser, the inner tube of which is prolonged as a gas-delivery tube which can be connected to a Schiff's gas-collecting tube. Carbon dioxide is passed through till all air is expelled, the liquid being meanwhile kept just under 100° C. The solution of hydrazine hydrochloride is then added from the tap-funnel, and a slow stream of carbon dioxide kept up till the volume of gas ceases to increase; the gas is then transferred to a Hempel's gas-burette for measurement. No other gas than hydrogen is produced. The results are accurate whether mercuric salt or hydrazine salt is in excess, so that the process can be used for the determination of either.

In ammoniacal solution.—The process is carried out in general in the same way, save that the air in the flask may be boiled out by ammonia. In this case, however, volumetric determination of the amount of hydrazine remaining from a given quantity may be used to determine the mercury, using Stolle's method (this J., 1902, 1351) of titrating the hydrazine by iodine in presence of alkali bicarbonate. N/10 iodine and N/40 hydrazine sulphate solutions are prepared and are equivalent, volume for volume ($N_2H_4 + I_2 = 4HI + N_2$); N_2H_4 , moreover, is equivalent to 2Hg, so that 1 c.c. of either solution = 0.01 gram of mercury. The mercuric compound (0.5 gram.) is dissolved in a 300 c.c. flask and made strongly acid with hydrochloric acid; ammonia is then added in such excess as to redissolve the first-formed precipitate, and 50 c.c. of the hydrazine solution added. The liquid is heated on the water-bath till the mercury has completely subsided, cooled, made up to the mark, and successive portions of 50 c.c. titrated, after adding potassium bicarbonate, with iodine and starch. The amount of hydrazine solution used by the mercury compound is thus arrived at.

These methods, from their simplicity and quickness, are well adapted for the rapid assay of mercury ores. They are not interfered with by other metals, save copper, silver, and the rare noble metals. If copper and silver be present in a mercury ore, the acid solution is supersaturated with ammonia, and to the clear solution excess of hydrazine salt is added. The silver and mercury are precipitated, the copper reduced to cuprous salt. After filtering and washing, the silver and mercury are dissolved in nitric acid, the silver precipitated as chloride and filtered off, the filtrate rendered ammoniacal, and the mercury precipitated by hydrazine. The thoroughly washed precipitate, with the filter, is dissolved in *aqua regia*, evaporated to dryness, the residue taken up with water, and the mercury in the solution determined as above. —J. T. D.

Tin in Copper-Tin Alloys; Rapid Method for the Determination of —. A. G. Levy. Analyst, 1905, 30, 364—367.

The method described is especially applicable to guns and bearing metals containing not more than traces of bismuth and antimony. 0.5 gram. of the alloy in the form of saw-dust or fine drillings is gently heated in a 30 c.c. distilling flask through which is passed a current of perfectly dry chlorine, carrying hydrogen chloride derived from its passage through a wash-bottle containing fuming hydrochloric acid. The stannic chloride formed is collected in water contained in two Volhard receivers, connected with the side-tube of the distillation flask by a bent glass tube. To prevent the mechanical carrying-over of chlorides of copper, lead, &c., a plug of glass-wool is wrapped around the chlorine inlet tube below the side-tube of the flask; the side-tube itself is first bent upwards for a short distance and then only down. When apparently the whole of the stannic chloride has been volatilised, the heating is interrupted, 10 c.c. of hydrochloric acid are added after pushing the plug of glass-wool down into the flask, and the liquid is distilled nearly to dryness. This treatment sweeps the last traces of stannic chloride into the receivers. The tin in the latter is precipitated as sulphide, which is washed thoroughly and ignited to oxide, without removing it from the filter-paper. A fairly bright red heat is used for the final ignition. The usual trace of antimony is then identified by fusing the stannic oxide with sodium hydroxide, dissolving the melt in a small excess of hydrochloric acid, and treating the solution in a platinum dish with iron wire. From the test-analyses quoted the method appears to give good results. For alloys containing appreciable quantities of antimony, it may be modified by washing the mixed sulphide precipitate into a dish, oxidising with nitric acid, igniting to oxides, and then separating these by Rose's method. —A. G. L.

Match Igniting Compositions; Analysis of —. C. Bender. Chem. Ind., 1905, 28, 679—682.

OWING to the inflammable nature and complicated character of match compositions, special care and special methods are necessary for their analysis. The author gives an outline of the analytical methods he would use for the analysis of a match consisting of cotton threads, with a head composed of a mixture of ordinary phosphorus, potassium chlorate, gums, ultramarine and lycopodium, the whole being varnished and paraffined.

Since in this case the heads cannot be removed mechanically, a quantity of the matches are weighed out, placed in a Soxhlet apparatus and extracted with ether. In this way paraffin, shellac and a trace of phosphorus are removed; and on distilling off the ether, the extracted matter may be weighed. The paraffin is directly estimated by saponifying the extract, and diluting with a large quantity of water—to precipitate any paraffin retained in solution by the alcohol formed on saponification—or by treating it with fuming sulphuric acid.

The author considers that the small quantity of phosphorus extracted by the ether is negligible, but it can be estimated by boiling the final distillate under a reflux condenser with bromine water, and precipitating as phospho-molybdate.

The matches are then placed in a reflux apparatus, carbon dioxide being passed through till all the air is expelled, and the flask warmed and shaken to loosen the composition from the threads. The phosphorus may then be melted, and collected into a globe which is taken out and weighed. The phosphorus may also be estimated as phospho-molybdate, but the above method is said to be quite accurate enough for ordinary requirements.

The threads are then boiled with water, which dissolves the gum and the chlorate, and a portion of the solution is evaporated to constant weight to determine the total extract. The chlorate is estimated by reduction either with oxalic acid or zinc and acetic acid, and precipitated as chloride, the gum thus being obtained by difference.

The insoluble residue consists of lycopodium, ultramarine and organic matter. It is filtered, dried at 100° C., weighed, and finally ignited, an analysis being carried out on the inorganic residue if necessary.

Two other samples of match compositions are mentioned by the author, one of which contained paraffin in the mixture itself, together with potassium chlorate, gums, red phosphorus and calcium sulphate, whilst the other contained antimony sulphide, but no paraffin nor calcium sulphate.

In the first, the residue after extraction with ether was boiled with water, and the insoluble portion treated with bromine water to remove the phosphorus, and with hydrochloric acid to dissolve the antimony sulphide. The undissolved portion consists of cellulose, and if washing has not been thorough, a trace of calcium sulphate will be present.

In compositions which contain yellow phosphorus, it is essential that it be very finely divided. This is best ascertained by the microscope, the use of which forms a valuable adjunct to the analytical methods.—B. J. S.

Solutions, Solid —. R. F. Korte. XXIV., page 1259.

ORGANIC—QUALITATIVE.

Paranitraniline Red; A Simple Test for —. E. Knecht. J. Soc. Dyers and Colourists, 1905, 21, 296.

To test a dyed or printed fabric for Paranitraniline Red, it is held above a very small gas flame, about $\frac{1}{2}$ in. high, at a height of about $\frac{3}{4}$ in. above the top of the flame. In the case of Paranitraniline Red, an orange-coloured spot makes its appearance, and something is seen to volatilise from the surface. The colour does not return on exposure to air or on moistening. If a small piece of white paper or calico be placed on the cloth at the point where it is heated, the sublimed Paranitraniline Red deposits on it. With Naphthylamine Claret the test is even more striking. Other red dyestuffs behave in quite another manner. With Turkey Red or Alizarin Red, the heated part becomes blackish, but resumes its normal colour on exposure to the air, or, more rapidly, on moistening. With Benzopurpurin and most other direct reds, the colour merely becomes duller and also resumes its normal appearance when moistened.—E. F.

Lactic Acid; New Test for —. W. Croner and W. Cronheim. Berliner Klin. Wochenschr., 1905, 42, 1080; Z. Spiritusind., 1905, 28, 429.

This test is based on the conversion of the lactic acid into isoform, and of the latter into phenyl isocyanide, which can be recognised in very small quantities by its smell. Two grms. of potassium iodide are dissolved in water, 1 gm. of sublimed iodine added, and the solution filtered through glass-wool or asbestos and made up to 50 c.c.; 5 c.c. of aniline are then added, and the liquid kept in a dark-coloured bottle. A few c.c. of the liquid to be tested are rendered alkaline with 10 per cent. potassium hydroxide solution, after which the liquid is boiled for a few minutes and then mixed with a little of the iodine-aniline solution; the presence of lactic acid is indicated by the well-known isonitrile odour.—T. H. P.

ORGANIC—QUANTITATIVE.

Beetroots; Determination of Sugar in —. A. T. Höglund. Z. Ver. deut. Zuckerind., 1905, 55, 1048—1058.

For the determination of sugar in beetroot, a weighed quantity of beet pulp is either extracted by alcohol in a Soxhlet's apparatus or digested with alcohol at a temperature of 75°–80° C. When the alcoholic solution of sugar thus obtained is filtered, the first portion of the filtrate will be found to have a considerably lower polarisation value than later portions, and the amount of the difference will be found to be greater as the thickness of paper through which the solution is passed is increased. The author has studied the importance of this error by filling a number of polarisation tubes consecutively with the filtrate, and determining the polarisation value of each portion comparatively with the unfiltered solution. This experiment was conducted with increasing thicknesses of filter paper from one to five. With several filters, it was found that the real polarisation value was not attained

by any portion of the 100 c.c. of solution employed, but with single or double filters, the true polarisation value is reached after two or three tubes have been filled. Hence the rule, always to throw away the first half of the filtrate, is deduced. This effect is not due to the moisture of the paper, since it occurs with perfectly dry paper, but it depends on the property possessed by the cellulose of absorbing sugar from alcoholic solutions, just as bone-charcoal absorbs sugar. From the above observation it is inferred that the cellulose of the beetroot pulp holds back sugar when the method of digestion is employed. The author shows that such is indeed the case, and that the method of digestion gives slightly lower results than the method of extraction. The error involved is not, however, a very serious one, and may probably be neglected in the analysis by digestion of normal beetroots. But in the case of beets poor in juice or otherwise abnormal, the extraction method is to be preferred to that of digestion.—J. F. B.

Meat Extract; Determination of the Organically Combined Phosphorus in —, as a Means of Judging its Freedom from Decomposition. M. Siegfried and E. Singewald. Z. Unters. Nahr. Genussm., 1905, 10, 521–527.

It is shown by actual experiment that the organically combined phosphorus in meat extract is destroyed as decomposition proceeds, and that in a badly decomposed extract, it is practically non-existent. On this fact, the authors base a method to ascertain whether a meat extract has been prepared from fresh meat, and also whether the extract has remained free from decomposition after its manufacture.

Determination of the Organic Phosphorus. Fifteen grms. of the extract are placed in a 500 c.c. flask, dissolved in about 300 c.c. of water, and the inorganic phosphorus compounds (phosphates) precipitated by the addition of 50 c.c. of 10 per cent. barium chloride solution and 10 c.c. of 10 per cent. ammonia. After shaking and allowing the precipitate to settle, a portion of the clear liquid is tested with a little more barium chloride to see whether enough has been added, and the portion tested returned to the flask. The contents of the flask are then diluted to the mark, mixed and filtered; 450 c.c. of the filtrate are transferred to a silver basin, evaporated, and the residue fused with a mixture of sodium hydroxide and potassium nitrate. The melt is then dissolved in dilute nitric acid, the solution boiled to remove nitrous acid, and the phosphoric acid precipitated with molybdic acid solution. The precipitate is finally converted into ammonium magnesium phosphate and weighed as pyrophosphate.

The total phosphorus is also determined by dissolving 7 grms. of the extract in 250 c.c. of water, evaporating 100 c.c. of the solution in a silver basin and fusing the residue with sodium hydroxide and potassium nitrate. The phosphoric acid in the melt is then determined as above described. Ammoniacal barium chloride solution does not precipitate any organic phosphorus compounds.

Six samples of meat extract, manufactured in the years 1894 to 1903 inclusive, contained from 2.22 to 3.29 per cent. of total phosphorus, and from 0.22 to 0.38 per cent. of organically combined phosphorus. The organic phosphorus constituted from 9.3 to 11.6 per cent. of the total phosphorus, the average being 10.3 per cent. The age of an extract has therefore no influence on the amount of organically combined phosphorus. A portion of meat extract prepared in 1901, when dissolved in water and allowed to spontaneously decompose for 19 days, gave at the end of this period only 0.02 per cent. of organically combined phosphorus.—W. P. S.

Hydrocyanic Acid; Modification of the Methods of Liebig and of Fodoros and Gélis for the Volumetric Determination of —. Application to the Titration of Cherry Laurel and Bitter Almond Waters. G. Guérin. J. Pharm. Chim., 1905, 22, 433–435.

THE modification consists in the addition of borax, before titration.

Modified Liebig Method. A measured quantity of the solution containing the hydrocyanic acid, suitably diluted is treated with an equal volume of 3 per cent. solution of borax, and then titrated with standard silver nitrate.

solution, in the usual manner, until a permanent opalescence appears. The reaction takes place according to the following equation:—

Thus, if the standard silver solution contain 3.148 grms. of silver nitrate per litre, each c.c. will be equivalent to 0.001 grm. of hydrocyanic acid. The solutions titrated must be free from ammonium salts, since these prevent the precipitation of silver cyanide; but this difficulty may be overcome by the addition, before titration, of a slight excess of saturated aqueous solution of boric acid.

Modified Fördos and Gelis Method. Before titration with standard iodine solution, a known quantity of the liquid to be tested is treated with an equal volume of 3 per cent. borax solution. The volumetric solution of iodine is then run in until one drop gives a permanent yellow tint. The reaction takes place thus:—

If, therefore, the volumetric solution of iodine contain 9.107 grms. per litre, 1 c.c. will be equivalent to 0.001 grm. of hydrocyanic acid.

In the case of cherry laurel water and bitter almond water, 10 c.c. is a convenient quantity to operate on. The presence of benzaldehyde in the water does not, in the least, interfere with the iodometric method with solutions of the strength indicated.—J. O. B.

Pyrimidone [Dimethylaminoantipyrine]; Determination of —. A. Astruc and G. Pégurier. *Ann. Chim. anal. appl.*, 1905, 10, 302–303. *Chem. Centr.*, 1905, 2, 927–928.

LEMAIRE (this J., 1905, 109) has used a method for the determination of antipyrine based upon the precipitation of the base by picric acid. The author recommends a similar method for the determination of pyrimidone. 0.231 grm. of the sample is dissolved in 10 c.c. of water, and 40 c.c. of N/20-picric acid solution are added. After shaking for some minutes, the mixture is filtered, and in 25 c.c. of the filtrate the excess of picric acid is titrated with N/10-alkali, using phenolphthalein as indicator. If n c.c. of alkali be required, the percentage of pyrimidone in the sample is given by the expression: $(40 - 4n) \cdot 5$.—A. S.

Pyrimidone and Antipyrine; Volumetric Determination of — in a Mixture of the two Substances. G. Pégurier. *Ann. Chim. anal. appl.*, 1905, 10, 392–393. *Chem. Centr.*, 1905, 2, 1554.

THE author makes use of the fact that whilst antipyrine is neutral to methyl orange, pyrimidone reacts as a monobasic substance with this indicator. The two bases are first determined together as described in the preceding abstract. 0.231 grm. of the sample is then dissolved in 10 c.c. of water, the solution exactly neutralised with N/10-acid in presence of methyl orange, and the antipyrine afterwards determined by means of picric acid as already described. (See also this J., 1905, 639).—A. S.

Cream of Tartar; Analysis of —. E. J. Parry. *Chem. and Druggist*, 1905, 67, 838–839.

THE author states that in numerous legal cases with respect to the presence of more or less lead in cream of tartar, the amount of lead has been exaggerated owing to failure to separate other metallic impurities. The colorimetric method for the determination of lead proposed by Warington, which is similar to that employed in the case of tartaric acid (see this J., 1893, 97), except that sodium sulphide is used instead of ammonium sulphide, is stated to be the most satisfactory one.

For the determination of the potassium bitartrate, direct titration of an aqueous solution of the tartar with sodium hydroxide is probably the best method for refined cream of tartar, but for crude products, the following method is more useful: Two grms. of the substance are treated with successive quantities of water until the last extract is quite neutral to litmus. The combined extracts are evaporated to 20 c.c., and treated with 200 c.c. of alcohol.

After two hours, the precipitated potassium tartarate is filtered off and titrated.

Calcium sulphate is determined by dissolving 10 grms. of cream of tartar in 150–200 c.c. of boiling water acidulated with hydrochloric acid, and adding barium chloride, the quantity of calcium sulphate being calculated directly from the weight of barium sulphate.—A. S.

XXIV.—SCIENTIFIC & TECHNICAL NOTES.

(Continued from page 1194.)

Ice Formation and the Grained Structure of Glaciers. G. Quincke. *Ann. der Physik*, 1905 [4], 18, 1–80. *Chem. Centr.*, 1905, 2, 1510–1511.

A CONCENTRATED aqueous solution of saline substances can appear oily, that is, exhibit surface tension, at the place of contact with water or a dilute solution of saline substances. If pure water or water containing dissolved saline substances be frozen at different rates, and then allowed to thaw slowly under varied conditions, the different layers or strata of the ice prisms show the same phenomena, in a similar order, as solutions of silicic acid, glue and other colloids, which have been dried to jellies or lamellae. Ice may be regarded as a liquid jelly with foam-walls ("Schaumwänden") of liquid, oily, concentrated saline solutions, enclosing foam-cells ("Schaumkammern") containing viscous, doubly-refracting dilute saline solution or pure water. The plasticity of ice decreases as the temperature falls. "Glacier-grains" are foam-cells separated from one another by foam-walls of an oily saline solution. Jellies of silicic acid and glue exhibit phenomena quite analogous to the regulation of ice. It was not found possible to prepare water free from traces of salts. The white portions of ice, containing most air-bubbles, are also the richest in salts, and these parts melt first. Very dilute solutions (from three to six-millionths per cent.) of different salts, when frozen slowly under similar conditions, gave oily lamellae of different viscosity and surface tension. By repeated fractional freezing and thawing of the ice crystals, purer ice with larger hexagonal prisms or foam-cells (glacier-grains) was obtained, but it was not found possible to obtain ice free from such foam-cells. Artificial ice is clearer, denser and harder to cut, the more slowly it is frozen and the purer the water. Ice crystals consist of doubly-refracting cohesive liquid, and occupy an intermediate position between the soft crystals of serum-albumin and the hard crystals of quartz, feldspar, &c. The blue bands of glacier ice consist of almost pure ice, whilst the white portions contain saline substances and air-bubbles.—A. S.

Solutions; Solid —. R. F. Korte. *Chem. Soc. Trans.*, 1905, 87, 1503–1515.

EXPERIMENTS were made with a view to ascertain whether van't Hoff's theory of solid solution is sufficient to explain some well-known cases of adhesion (or carrying down of foreign substances by precipitates) in quantitative analysis. *Absorption of Iron Salts by Barium Sulphate* (see this J., 1889, 819). A constant quantity of sulphuric acid was precipitated, at the boiling temperature, with barium chloride in presence of varying amounts of ferric chloride. It was found that the amount of ferric salt carried down by the barium sulphate bore no relation to the quantity present in the solution. The dried precipitate loses in weight on ignition, sulphur trioxide being evolved. The results indicate that the carrying-down of ferric salts by barium sulphate is due to a combination of physical and chemical processes and is not a case of solid solution. *Oclusion of Magnesium Oxalate by Calcium Oxalate* (see this J., 1901, 1026). A constant amount of calcium chloride in presence of varying quantities of magnesium nitrate was precipitated with excess of ammonium oxalate in slightly ammoniacal aqueous solution at the boiling temperature. The precipitate, after standing for four hours, was washed twice by decantation with a hot 1 per cent. solution of ammonium oxalate, and four times on the filter with cold water. It was then dissolved in dilute nitric acid, and the free oxalic

acid titrated with permanganate. It was found that so long as the quantity of magnesium present was not greater than 36 parts per 5 parts of lime, the amount occluded by the calcium oxalate increased with the amount of magnesium present, but was very slight as compared with the total precipitate formed; up to the limit mentioned, the amount of occluded magnesium was independent of the time of contact of the solution with the precipitate before filtration. When the amount of magnesium present exceeded the limit given, however, the quantity of magnesium oxalate precipitated increased rapidly. The amount of occluded magnesium is slightly greater when the precipitation is carried out in the cold. The magnesium oxalate carried down by the calcium oxalate can only be removed to a very slight extent by repeated washing with boiling water. This occlusion of magnesium oxalate thus appears to be a case of solid solution, and when calcium is precipitated as oxalate in presence of considerable quantities of magnesium, it is necessary to dissolve and reprecipitate the calcium oxalate in order to obtain accurate results. *Solid Solution of Manganese Oxide in Ferric Oxide.* On precipitating a constant quantity of iron, in presence of varying quantities of a manganeous salt, with ammonia and ammonium chloride at the boiling temperature, it was found that the weight of the precipitate increased in proportion to the amount of manganese salt present until a fairly well-defined point was reached, beyond which no further increase was observed. The weight of the precipitate was, however, also influenced by other factors. On boiling the solution containing the hydrated precipitate before filtering, the occluded manganese hydroxide is dissolved to some extent. For example, the precipitates obtained from equal quantities of iron and manganese salts were boiled for one minute and ten minutes respectively; after ignition the first was found to contain 0.0661 grm., and the second only 0.0016 grm. of manganese protosessquioxide, Mn_2O_3 . A large excess of ammonium chloride causes considerable irregularities in the quantity of manganese hydroxide carried down. The occluded manganese hydroxide is partially oxidised, if the water used for solution or washing contain dissolved air or oxygen. The maximum quantity of manganese hydroxide is occluded when the aqueous solution contains iron and manganese oxides in the proportions: 5 parts of ferric oxide to 1 part of manganeous oxide. If oxidation of the manganese hydroxide be prevented as much as possible, practically manganese protosessquioxide alone is in solid solution with the ferric oxide, but if the manganese hydroxide become partially oxidised, or if basic salts of manganese be formed by oxidation of the double salt, $MnSO_4 \cdot 2NH_4Cl$, in solution, higher oxyhydroxides of manganese are probably produced, and on ignition of the precipitate, a mixture of the sesquioxide and protosessquioxide of manganese in solid solution with ferric oxide is obtained. It is not possible practically to remove all the occluded manganese hydroxide by repeated precipitations of the iron. *Solid Solution of Nickel Oxide in Ferric Oxide.*—A constant quantity of a ferric salt in presence of varying quantities of a nickel salt was precipitated with ammonia and ammonium chloride at the boiling temperature. The amount of nickel carried down by the ferric hydroxide increased with the quantity present in the solution up to a maximum, which was attained when the solution contained about 0.043 grm. of nickel oxide (NiO) to 0.11 grm. of ferric oxide. The precipitate after ignition contained ferric and nickel oxides in the proportion 5.9 : 1.

Experiments with aluminium hydroxide showed that whilst this compound carries down considerable quantities of foreign substances, the amounts so carried down vary in a most irregular manner, even in experiments under similar conditions, and the phenomenon, in this case, is probably due to mechanical inclusion, depending on the gelatinous nature of the aluminium hydroxide.—A. S.

Iron; Dunstan, Jowett and Goulding's Paper on the Rusting of — E. Divers. X., page 1235.

Sugars and Other Optically Active Hydroxy-Compounds; Action of Alkaline Uranyl Salts on the Rotatory Powers of — H. Grossmann. Z. Ver. deut. Zuckerind., 1905, 55, 1058—1073.

In a series of studies analogous to those with lead and bismuth salts (see this J., 1905, 1119), the author found that levulose and mannitol readily react with alkaline solutions of uranyl nitrate, forming alkaline solutions with an intense golden yellow colour, the rotatory powers, of which are widely different from those of the original substances. Complex compounds are thus produced in which the hydrogen atoms of the hydroxyl groups are replaced by the uranyl residue UO_2 . The combination of equimolecular proportions of uranyl salt and levulose or mannitol is accompanied by reversal of the sign of the rotation. Dextrose, galactose, milk sugar and rhamnose also react with uranyl salts in alkaline solutions, but the sign of the rotation is not reversed; only in the case of rhamnose is the rotatory power increased by the uranyl salt, with the other sugars it decreases. Cane sugar changes slowly into the alkali-uranyl compound which is levorotatory; the sugar molecule does not appear to be changed by the reaction. The extremely low rotatory power of mannitol $[\alpha]_D = -0.25^\circ$ is changed by the action of a large number of reagents which give strongly dextrorotatory compounds; the compounds of boric acid, molybdic acid and uranic acid with mannitol have been studied.

The increase in the rotatory power of tartaric acid by uranyl nitrate and caustic soda, first recorded by Walden, is not a reaction which takes place in alkaline media, but requires the presence of hydrogen ions. For this reason it would appear that the uranyl residue combines not with the hydroxyl groups but with one of the carboxyl groups. Saccharic acid behaves, in the main, similarly to tartaric acid, but changes in the sign of the optical rotations occur as the proportions of the reagents are varied. The precipitation of uranium salts by alkalis is not prevented by the presence of tartaric acid.—J. F. B.

Wheat Grain; Influence of Different [Coloured] Rays of Light on the Migration of Albuminoids in — J. Dumont. Comptes rend., 1905, 141, 686—688.

PORTIONS of a field of growing wheat were covered with ventilated glass casings of various colours from the time when the grain first appeared until it was fully ripened; and samples were examined each week, as well as a sample grown in the open air. It was found that the wheat grown under coloured glass was much richer in nitrogen than the ordinary sample, the increase being most notable in the case of the green glass, followed by the dark brown, blue and red. The increase was observed both in the grains and in the husk. It is concluded that the rays which contribute most to the migration of albuminoids in the wheat grain are those which act least on the "chlorophyllian function."—T. F. B.

New Books.

CHEMIKER-KALENDAR, 1906. Ein Hilfsbuch für Chemiker, Physiker, Mineralogen, Industrielle, Pharmazeuten, Hüttenmänner u. s. w. Von Dr. RUDOLF BIEDER-MANN. 27 ster Jahrgang. In zwei Theilen. Julius Springer's Verlag. Monbijouplatz 3. Berlin. 1905. Price M.4.

Part I.—Arranged as a pocket-book, and containing almanack for 1906, with also a table of the more frequently used atomic weights and their multiples. The general text refers principally to matters of pure chemical interest. I. Atomic and Molecular Weights. II. Different Properties of Chemical Substances. III. Gaseous and

Vapour Densities. Specific Gravities. (1) Alkalis. (2) Acids. (3) Salts. (4) Alcohols, &c. IV. Solubility. V. Analysis. VI. Volumetric Analysis. VII. Gas Analysis. VIII. Spectrum Analysis. The matter in these different groups is mainly composed of Tables. A Notebook Calendar with blank pages is arranged for the different days of the year. The subject matter, exclusive of the Calendar and the blank pages for Notes, fills 367 pages.

Part II.—This supplement is of similar size to the pocket-book, but is unbound, and is more directly concerned with Chemical Technology. It contains Tables relating to:—I. Physics and Physical Chemistry. II. Mineralogy. III. Technical Chemical Analysis and Investigations. Besides the tabulated matter, however, there are concise descriptive paragraphs of introductory character, with descriptions of Analytical Methods. The subdivisions are as follows:—(1) Water. (2) Assaying. (3) Fuels. (4) Sulphuric Acid. (5) Alkali. (6) Bleaching Powder. (7) Salt-petre and Explosives. (8) Ceramics. (9) Glass. (10) Mortar and Cement. (11) Illuminants. (12) Starch and Sugar. (13) Fermentation Industry. (14) Fats and Oils. (15) Tanning. (16) Textile Fibres and Paper. (17) Photography. (18) Dyeing. (19) Physiological Chemical Analysis. Appendix with various recipes, &c. The subject matter fills 516 pages.

UNTERSUCHUNG DER MINERALÖLE UND FETTE. SOWIE DER IHEN VERWANDTEN STOFFE, MIT BESONDERER BERÜCKSICHTIGUNG DER SCHMIERMITTEL. Von Dr. D. HOFME, Professor, Abteilungsvorsteher am Kgl. Materialprüfungsamt zu Gr.-Lichterfelde, W. Berlin, &c. 2. Auflage. Julius Springer's Verlag, Berlin. Price M. 10.

8vo volume, containing 400 pages of subject matter, illustrated with 99 engravings, and alphabetical indexes of subjects and names of authors. The subjects treated of are classified as follows:—I. PETROLEUM AND ITS PRODUCTS. A. Crude Petroleum. B. Benzine [Petroleum Spirit]. C. Petroleum as an Illuminating Agent. D. Cleansing and Polishing Oils from Crude Petroleum. E. Gas Oils. F. Oils for Electrical Transformers (Electr. Power Stations). G. Heating Oils (Masut, astatki). H. Lubricating Oils. J. Testing the consistency of Lubricants. K. "Water-soluble" or Emulsified Mineral Oils. L. Paraffin Seale and Soft Paraffin from Crude Petroleum. M. Vaseline. N. Tarry- and Pitch-like Distillation Residues. O. Refuse Products of the Petroleum Industry. II. TARS AND SOLID BITUMENS. A. Bitumen and Tar from Brown Coal. B. Shale tar. C. Peat tar. D. Mineral wax. III. SAPONIFIABLE FATS AND WAXES. A. Vegetable and Animal Fats and Oils. B. Waxes. IV. TECHNICAL PRODUCTS PREPARED FROM SAPONIFIABLE FATS AND WAXES. A. Stearin Candles. B. Wool Oils. C. Soaps. D. Soap Powders. E. Turkey Red Oil. F. Varnishes and Laes. G. Blown Oils. F. Dégras. J. Linoleum. K. Iodised Fats. L. "Fakts," or Indiarubber substitutes.

GLUE, GELATINE, AND THEIR ALLIED PRODUCTS. A practical Handbook for the Manufacturer, Agriculturist, and Student of Technology. By THOMAS LAMBERT, Chas. Griffin and Co., Limited, Exeter Street, Strand, London. 1905. Price 5s. nett.

SMALL 8vo volume, containing 148 pages of subject matter and the alphabetical index. The text is illustrated with 25 woodcuts, and treats of the following leading subjects:—I. HISTORICAL. Properties of Glue and Gelatin. Installation of Works. II. to IV. GLUE. V. GELATIN. VI. SIZE AND ISINGLASS. VII. TREATMENT OF EFFLUENTS PRODUCED IN GLUE AND GELATIN MAKING. VIII. LIQUID AND OTHER GLUES, CEMENTS, &c. IX. USES OF GLUE AND GELATIN. X. RESIDUAL PRODUCTS FROM GLUE AND GELATIN. XI. ANALYSES OF RAW AND FINISHED PRODUCTS. APPENDIX. Some recent specifications relating to the Manufacture of Glue and Gelatin. TABLES relating to Tests for Glue and Gelatin, Viscosity, Price, Odour, Viscosity and percentage of non-gelatin in glues, &c., &c.

INTRODUCTION TO THE STUDY OF ORGANIC CHEMISTRY. A Theoretical and Practical Text Book for Students in the Universities and Technical Schools. By JOHN WADE, D.Sc. (Lond.), Lecturer on Chemistry at Guy's Hospital, University of London. New and Enlarged Edition. With Appendix containing Supplementary Practical Details, forming with the text an Illustrative Laboratory Course. Swan, Sonnenschein and Co., Ltd., 25, High Street, Bloomsbury, London, W.C. 1905. Price 8s. 6d. nett.

CONTAINS 624 pages of subject matter, with 24 illustrations and numerous diagrams.

CHEMIE DER ALICYKLISCHEN VERBINDUNGEN. Von OESSEN ASCHAN, A. O. Professor an der Universität Helsingfors. Friedrich Vieweg und Sohn's Verlag, Braunschweig, Germany. 1905. Price M.40. Bound in cloth, M.42.

LARGE 8vo volume, containing a Dedication to Prof. A. von Baeyer, 1133 pages of subject matter with four illustrations, and the alphabetical index. The leading themes considered in this work are as follows:—I. GENERAL PORTION. Introduction. (i) Theoretic Development of the Chemistry of the Alicyclic Compounds. (ii) Influence of the Ring formation and binding on the Chemical Nature of the Alicyclic Compounds. (iii) Influence of the Ring Formation on some physical properties of the Alicyclic Compounds. (iv) The Stereo-Chemistry of the Alicyclic Compounds. II. SPECIAL PORTION. (i) Methods of Formation and Preparation of the Alicyclic Compounds, systematically considered. (ii) Monocyclic Compounds. (iii) Bicyclic Compounds. (iv) Tri- and Polycyclic Compounds.

COLONIAL IMPORT DUTIES. [Ed. 2627.] Wyman and Sons, Fetter Lane, E.C. Price 2s. 3d.

8vo volume of 520 pages, comprising a return relating to the rates of import duties levied upon articles imported into the British Colonies, Possessions and Protectorates. (For summary of contents, see this J., 1905, 1194.)

ASBESTOS, ITS OCCURRENCE, EXPLOITATION AND USES. By F. CIRKEL, Mines Branch of the Department of the Interior, Ottawa. 1905.

LARGE 8vo volume, containing 169 pages, including an index; also a map and 57 illustrations. The subject is treated according to the following classifications:—(i) History, Qualities of Asbestos, Geological Distribution and Character of the Deposits. (ii) Mining of Asbestos. (iii) The Dressing of Asbestos for the Market; Summary of the Principles in the Separation of Asbestos. (iv) Costs of Extraction, Market and Prices; Statistics and Status of Industry. (v) Asbestos Mines and Prospects. (vi) Asbestos in Foreign Countries. (vii) Commercial Applications of Asbestos. There is also a short Appendix giving an abstract of the Mining Laws of the Province of Quebec, and some bibliographical notes.

MICA, ITS OCCURRENCE, EXPLOITATION AND USES. By F. CIRKEL. Published by the Mines Branch of the Department of the Interior, Ottawa, Canada. 1905.

LARGE 8vo volume, containing 148 pages of subject matter and index, with 38 illustrations and two maps. The following are the headings under which the subject is dealt with:—(i) Physical and Chemical Properties and Geographical Distribution of Micas. (ii) Muscovite and Phlogopite. (iii) Mining and Preparation of Mica. (iv) Mica Mines and Locations. (v) State of the Canadian Mica Industry. (vi) Commercial Applications of Mica. (vii) Mica in Foreign Countries. An Appendix contains an abstract of the Mining Law of the Province of Quebec and of the Mining Act of the Province of Ontario, together with a Bibliography.

Trade Report.

I.—GENERAL.

COMMERCE AND INDUSTRY; RUSSIAN MINISTRY OF ——. *Times Financial Supplement*, Nov. 18, 1905.

An Imperial Ukase, issued on November 9, provided for the establishment of a Russian Ministry of Commerce and Industry. The scope of the new Ministry is defined as follows:—(1) The promulgation of all regulations respecting trade and industry (with the exception of trade taxation) and of all mining regulations; the control of the tariff council, the tariff committee, and the railways (except as regards finance). (2) The control of all matters affecting associations of merchants and commercial and industrial Courts, which have hitherto been under the Ministry of Internal Affairs. (3) The control of ports and merchant shipping. The Ukase also provides for the institution of departments to deal with matters concerning industrial taxes and other trade taxation, and with railway finances.

SWITZERLAND; NEW "GENERAL" CUSTOMS TARIFF OF ——. [*Cd.* 2768.]

This is a translation of the new "general" tariff of Switzerland as modified by the new commercial treaties concluded with Germany and Italy. It is intended to publish a further statement as soon as the whole series of Swiss Commercial negotiations has been concluded. The present return is obtainable from Wyman and Sons, Fetter Lane, E.C. Price 7d.

III.—TAR PRODUCTS, PETROLEUM, Etc.

PETROLEUM PRODUCTION OF THE WORLD IN 1904. *Chem. Trade J.*, Nov. 25, 1905.

The table given below shows the entire production of crude petroleum in all the known countries for 1903 and 1904, and under the head of "All other countries" an estimate for all of the smaller countries which are known to produce a limited quantity of petroleum, but from which it was impossible to secure returns.

There is a remarkable increase in all the known countries producing petroleum. In the United States the increased production in the new fields of Kansas, Texas, Louisiana and California has, in the last two years, amounted to more than one-half the crude oil of the entire world. The increase in the world's production in 1904 over 1903 was 23,958,990 barrels, equal to 12.3 per cent., as compared with a gain of 5.4 per cent. in 1903 over 1902, and of 11.7 per cent. in 1902 over 1901. The increase in the United States in 1904 over 1903 was 16,602,084 barrels. For the same period in Russia there was an increase of 2,909,649 barrels. There was a notable increase in the production of India, Roumania and Germany. Of the world's production in 1904 the United States and Russia produced 89.24 per cent.; India, Galicia, and Roumania produced 5.89 per cent., leaving 4.87 per cent. for all the remaining countries.

The table is one of production only, irrespective of quality and value. The quality of the greater proportion of crude petroleum produced in the United States is superior to any other in the percentage of valuable products secured by distillation:—

Country.	1903.	1904.
	Quantity.	Quantity.
	Barrels.	Barrels.
United States	100,461,337	117,063,421
Canada	481,504	492,492
Peru and South American countries	61,745	66,200
Russia	75,591,256	78,500,905
Galicia	5,234,475	5,947,383
Sumatra, Java and Borneo	6,640,000	8,008,300
Roumania	2,768,117	3,572,625
India	2,510,259	3,385,468
Japan	964,000	1,111,975
Germany	445,818	637,332
Italy	20,000	36,400
All other countries	30,000	40,000
Total	195,203,511	219,162,501

PETROLEUM TRADE OF TURKEY.

Bd. of Trade J., Nov. 16, 1905.

According to the September Report of the Austro-Hungarian Consulate in Constantinople, the annual consumption of petroleum in Turkey is estimated at more than 2½ million cases. This total is divided as follows:—Constantinople, 1,050,000; Smyrna, 400,000; Salonica, 350,000; Syria, 600,000; other places, 250,000. About 95 per cent. of this total have hitherto come from Russia, and the remainder from Roumania and Austria-Hungary. Since the Baku disturbances, however, a decided alteration has taken place, and, owing to the deficient supply of Russian petroleum, petroleum from other countries has appeared in larger quantities on Turkish markets. This is especially the case with American petroleum, which, owing to its high price, was scarcely represented in Turkey.

The increase in the price of Russian petroleum has enabled American producers to offer their article at the same price. Imports of Roumanian petroleum will, it is expected, also increase. Petroleum from Austria-Hungary is found to be of satisfactory quality, but greater attention to method of packing is required. Petroleum is imported into Constantinople in tins, which when empty are used for various purposes, such as for holding water, paints, oils, &c., and consequently customers in Turkey pay special attention to having these tins of good material. In September prices, which were at the same time level for American and Russian petroleum, steadily rose.

V.—TEXTILES, YARNS, AND FIBRES.

ANILINE BLACK DYEING.

FACTORY AND WORKSHOP ACT, 1901.

Home Office Memorandum, Nov., 1905. [*Form* 829].

The vapour of aniline oil as used industrially is known to give rise to definite symptoms of ill-health, due to alteration in the blood* and to direct action, in severe cases, on the nerve centres. The effects are shown in a greyish or bluish coloration of the lips, with tendency to distension of the small veins, and characteristic paleness of the face. In slight cases these are often the only signs, but in others they are accompanied by varying degree of headache and dizziness, feebleness of the heart's action, some difficulty in breathing, a feeling of drowsiness and lassitude, and blueness of ears and nails. Occasionally—it may be as the result of accident, e.g., upsetting a carboy of acid into the mixing tank—complete unconsciousness, with very pronounced cyanosis (lividity) and paralysis of movement and of the senses, supervenes. In those who have worked long with aniline, in addition to the changes in the blood, gastric disturbance with loss of appetite is common.

Chronic acid or solutions of the alkali bichromates cause ulceration of the skin, which commences frequently, but not always, after an abrasion of the skin. The root of the nails, the creases over the knuckles, and the skin between the fingers are the parts most generally attacked. This ulceration, though less extensive than has been noted in workers engaged in the manufacture of the crystals, may penetrate to the bone and lead to loss of the nails or deformity of the joints of the finger. Danger is perhaps greatest in the handling of the crystals and boiling up of the solution, and among those thus employed perforation also of the septum of the nose has been found. In slab dyeing the chrome affliction in susceptible persons has been found usually to take the form of a papular eruption on the hands, especially round the knuckles, on the palm, in the fold between the thumb and first finger, and about the wrists and forearms. Constant contact with the solu-

* The red blood cells become altered in shape and are considerably reduced in number. As a consequence the red colouring matter and its capacity for conveying oxygen is much lower than normal. As the cyanosis produced by aniline differs from that of ordinary asphyxia in colour, duration, and sometimes in symptoms, it is possible that aniline undergoes chemical changes in the blood with formation of coloured products which account to some extent for the appearance presented.

tion causes the papule to burst leaving the chronic ulcerated condition so often found in workers.

Among 60 persons employed in seven factories in the mixing, preparing, and ageing processes, who were examined by the Medical Inspector in the months of July and August, 28 (47 per cent.) showed pete, grey, or blue colour of the lips, 34 (57 per cent.) characteristic pallor, and 5 scars, the result of previous work in chrome or of injury to the skin; while among 82 persons employed in the chroming, washing, drying, and other processes, 28 (34 per cent.) showed the same condition of the lips, 46 (20 per cent.) the pallor, and 11 (14 per cent.) present or past effects of chrome. Symptoms of headache, indigestion and heartburn, distaste for food, and drowsiness were complained of not unfrequently. Some tremor or slight weakness of grasp which pointed to debility was noted in 22 (16 per cent.). The symptoms are aggravated in hot, close weather. The fact that, with exception of mixing, all the processes are carried on in the same general atmosphere no doubt accounts for the presence of symptoms in the persons employed in chroming, washing off, and drying, although the incidence is considerably less than among those employed in preparing and ageing.

The following summary of provisions necessary for the protection of the health of persons employed in mixing, preparing, ageing, chroming, washing off, and drying, is based mainly on conditions already existing in one or other of the factories in question* :—

(1) Exhaust ventilation by means of ducts and hoods in connection with a fan (a) over each preparing machine, (b) at the point where dust is produced in chroming, and (c) in the process of steaming. Suitable inlets for air are of course necessary in each room.

(2) Ventilation of the "ager" to the outside air, by suitable ducts and by a fan where necessary.

(3) A mealroom† for the use of persons employed. No one should be allowed to introduce, prepare, or partake of food on the premises, except in the room provided for the purpose.

(4) Proper provision for keeping food, overalls, and clothing not worn during working hours.

(5) Ample washing accommodation,‡ e.g., basin for every five persons, with water laid on, and the necessary supply of soap, towels, and nailbrushes. There would be advantage in arranging the special washing accommodation near the cloakroom and mealroom. In some factories enamelled iron troughs fitted with waste pipes (without plugs) and a constant supply of warm water have proved more satisfactory than basins, and enable the worker to wash in running water. In addition, in view of the share taken by the skin in the absorption probably of aniline and certainly of bichromate, there should be facilities for the men to rinse the hands close to the place of employment.

(6) No person to be allowed to come into contact with bichromate who has any rash or ulcer (the result of chrome) on fingers, hands, or arms. The person weighing out the bichromate crystals, or ladling out the prepared aniline liquor, should be provided with (and wear) india-rubber gloves in good condition.

The high temperature caused by the presence of the ageing machine and drying rollers in the same room as that in which the other processes are carried on emphasises the need for exhaust ventilation, even apart from the

presence of aniline vapour. Exhaust ventilation, as near as possible to the point where the dust is produced, should obviate the necessity for wearing respirators, etc., at the chroming machine. The acid dust (due to copper sulphate) here produced in some factories gives rise to much discomfort and even injury to health. The erosion of the margin of the nose, found in a few cases in sweeping the floors, was probably due to this.

The need of clauses (3) and (4) above is illustrated by the fact that paper used to wrap up food is well known to turn yellow when kept in the workroom.

Great improvement in the conditions of work has resulted where the process of mixing has been done in a separate room. There would be less evolution of vapour if water were introduced first into the tank, then the hydrochloric acid, and finally the aniline oil. No person should be allowed to remain in the mixing room while the chemical action is going on.

A short notice, posted in the workroom, may serve to call attention to the need for special care on the part of the workmen. A draft of such a notice is appended.

To persons employed in Aniline Black.

Vapour of aniline oil and contact with bichromate may act injuriously on the health. This can be best avoided by attention to the following points:—

(1) Before meals and on leaving the factory the hands must be washed with soap in the washing basins provided. Constant use of chrome causes the hands to harden and become cracked. Opportunity should be taken during intervals of work to rinse the hands when wetted by the solutions.

(2) The same clothes should not be worn in the factory and at home.

(3) Food must not be taken into the workrooms. It must be eaten in the mealroom provided.

(4) Persons who find that their skins cannot stand bichrome, or who have sores, however slight, must report the fact to the foreman in order that work may be found for them elsewhere if possible. To continue to work in bichrome when sores have broken out is almost certain to lead to incapacity, with its consequences.

(5) The effects of aniline poisoning are made worse by indulgence in alcoholic liquor.

IX.—BUILDING MATERIALS, Etc.

SAND-LIME BRICK INDUSTRY OF THE UNITED STATES.

Mining World, Nov. 18, 1905.

The sand-lime brick industry, in the manufacture of which the first plant was erected in the United States in 1901, made slow progress until 1904. In 1903 there were only 16 plants that actually put a product on the market, which was valued at 155,400 dols. In 1904 this number had increased to 57 plants, reporting a product valued at 463,128 dols. That this method of manufacture of building material is a success and will be a permanent factor in the building industry is hardly to be doubted.

X.—METALLURGY.

GOLD PRODUCTION OF THE WORLD.

Eng. and Mining J., Nov. 11, 1905

The total gold production of 1904 is the largest on record, exceeding that of 1903 by 17,697,288 dols., or 5.1 per cent.; that of 1902 by 48,912,651 dols., or 14.4 per cent.; and that of 1901 by 86,448,215 dols., or 24.9 per cent. It was more than two and one-half times the average of the decade which followed the discovery of gold in California and Australia.

* Section 74 of the Factory and Workshop Act, 1901, authorises H.M. Inspectors to require exhaust ventilation where dust, gas, vapour, or other impurity is generated and inhaled by the workers to an injurious extent.

† Section 75 requires (1) suitable washing conveniences when poisonous substances are used and (2) suitable provision for enabling persons employed in rooms where such substances are used so as to give rise to dust or fumes, to take their meals elsewhere in the factory.

With the exception of the large increase in the Transvaal, the changes were not great, when 1904 is compared with 1903. Australasia retained the first rank as a producer, largely owing to the excellent results from the mines of Western Australia. The United States retained the second rank, while the Transvaal remained third, notwithstanding its gain of 27.5 per cent. Russia was fourth, the production being nearly the same in both years, which is remarkable in view of the disturbance caused in Siberia by the war. Canada was fifth, though its total decreased 13.1 per cent., a decline due to the smaller production of the Yukon, which is now passing through the depression inevitable to all placer mining countries in the time between the first working of the rich deposits, and the advance which will surely come with the more general and systematic exploitation of the country. Mexico and India were, respectively, sixth and seventh in the list of producers; and they are the only other countries showing over 10,000,000 dol. in the yearly totals.

Gold Production of the World.

	1903.	1904.
America, North:	Dols.	Dols.
United States	73,591,700	80,723,200
Canada	18,843,530	16,400,000
Newfoundland	141,477	209
Mexico	11,511,530	12,605,300
Central America	1,875,001	1,120,700
America, South:		
Argentina	30,000	9,200
Bolivia	19,520	3,000
Brazil	2,274,000	2,032,984
Chile	665,000	636,900
Colombia	2,724,000	2,032,984
Ecuador	275,000	132,900
Guiana (British)	1,611,000	1,460,580
Guiana (Dutch)	438,564	520,212
Guiana (French)	2,101,000	1,788,800
Peru	716,567	399,654
Uruguay	57,800	25,368
Venezuela	300,000	300,000
Europe:		
Austria-Hungary	2,251,086	2,210,166
Germany	1,707,650	1,817,288
Italy	31,663	44,000
Norway	7,404	7,234
Portugal	864	827
Russia	24,980,320	25,075,358
Spain	5,382	5,312
Sweden	33,900	42,235
Turkey	20,607	29,000
United Kingdom	102,339	102,400
Africa:		
Madagascar	1,139,963	1,345,121
Rhodesia	4,174,513	4,820,223
Transvaal	61,259,281	78,122,701
West Coast	1,239,807	1,500,000
Asia:		
Borneo (British)	725,000	723,450
China	6,500,000	4,500,000
E. Indies (Dutch)	501,000	662,500
India	11,140,069	11,002,464
Japan	2,086,657	4,500,000
Korea	3,500,000	1,000,000
Malay Peninsula	325,000	392,522
Australasia (Six States and New Zealand)	89,220,102	87,100,852
Unspecified	1,500,000	1,500,000
Total	329,628,356	347,325,644

Not all this increase has been due to discoveries of new gold deposits. A very considerable portion of it is the result of improved methods of treating ores. The cyanide process alone has furnished an appreciable part of the gain, and other methods of working and treatment of ores have done their share. No small portion of the output of 1904 came from gold mines which had been abandoned at an earlier date as not payable, but the operation of which has been renewed under improved methods. This is the case not only in the United States, where the advance in metallurgy has been very great, but also in other countries, as in Western Australia, where successful treatment of the ores in some of the largest mines now in operation presented problems which were at first regarded as difficult of solution.

Gold Production of the World, 1850-1904.*

	Dols.
1851-55, yearly average	132,701,302
1856-60	134,070,945
1861-65	122,977,779
1866-70	129,602,578
1871-75	115,566,164
1876-80	114,576,000
1881-85	101,614,811
1886-90	112,409,599
1891-95	162,724,688
1896-1900	261,906,948
1901	260,877,429
1902	298,412,993
1903	329,628,356
1904	347,325,644

* From 1850 to 1882 the figures are Soetbeer's; from 1882 to 1900, they are those of the United States Mint; from 1900 to 1904, they are those published by "The Mineral Industry."

MINERAL PRODUCTION OF PERU.

Eng. and Mining J., Nov. 11, 1905.

The *Boletín del Cuerpo de Ingenieros de Minas del Perú*, No. 24, states that the mineral and metallic production of Peru in 1904, compared with 1903, was as follows:

	1903.	1904.
Coal, metric tons	—	42,920
Bituminous shale, metric tons	—	16,000
Coke, metric tons	—	1,000
Crude petroleum, metric tons	37,079	38,683
Kerosene, cu. meters	—	2,744
Gasoline, cu. meters	—	110
Beazine, cu. meters	—	50
Residuum, metric tons	—	4,000
Lead, metric tons	1,302	2,209
Copper, metric tons	9,497	9,504
Silver, kilos	170,804	145,166
Gold, kilos	1,078	601
Borax, metric tons	2,466	2,075
Salt, metric tons	17,637	18,545
Sulphur, metric tons	—	21

The output in 1904 had a total value of 6,662,910 dol. United States currency.

IRON-ORE DISTRICT OF FRANCE; MINETTE —.

Eng. and Mining J., Nov. 18, 1905.

The iron ores of the Minette district are coming into prominence simultaneously with the entrance of France upon the world's iron market. These Minette ores are of oolitic nature, closely resembling the Clinton iron ores of the Eastern and Southern States of America, and are developed along the borders of Luxemburg and Lorraine. Two distinct basins are recognisable in French territory, that of Nancy and that of Briey and Longwy, the outputs of which during the last two years, have been, in metric tons:—

	1903.	1904.	Increase.
Nancy	1,668,533	1,711,770	43,237
Briey and Longwy	3,233,131	3,821,437	588,306
Quarries	390,679	418,067	27,388
Total Meurthe-and-Moselle	5,292,343	5,951,274	658,931

The Nancy district is not expected to show any important increase in the future, but Longwy, with its outcrop mines, and Briey with its deep mines, are looked to for further rapid growth in output.

Shipments of this ore to other departments of France, to Belgium, Luxemburg and Germany, totaled 1,043,000 tons in 1904; its average value at point of production was 2s. 10d. per ton. Employees in the iron mines numbered 6,075 in 1904; in the Longwy-Briey basin

their wages averaged about 5s. per day. Cutting machinery is popular, electrically driven Morgan Gardner chain machines being used in the mines at two localities.

XIX.—PAPER, PASTEBOARD, Etc.

PAPER INDUSTRY OF GERMANY.

For. Off. Miscell. Series, No. 642.

Whilst the home demand for nearly all descriptions of paper continues to increase in Germany, as well as in all other countries, the export trade of paper and pasteboard, and also of articles made of these materials, from the German Empire is of very considerable importance, as will be seen from the following figures:—

The following shows the various descriptions of paper and pasteboard exported to the United Kingdom in 1904, as compared with the figures for 1901:—

	Value	
	1901.	1904.
	£	£
Coloured and gold and silver paper ...	351,200	209,200
Printing paper (also coloured)	71,800	141,000
Packing paper, glazed	163,050	172,750
Packing paper, not glazed	56,100	67,700
Photographic paper	56,250	229,900
Paper not specially mentioned, also parchment paper	101,450	85,390
Wall paper	38,650	61,550
Articles made of paper and pasteboard	206,750	329,350

A.—Imports.				
	1903.		1904.

Patent List.

N.B.—In these lists, [A.] means "Application for Patent," and [C.S.] "Complete Specification Accepted."

Where a Complete Specification accompanies an Application, an asterisk is affixed. The dates given are (i) in the case of Applications for Patents, the dates of application, and (ii) in the case of Complete Specifications Accepted, those of the Official Journals in which acceptances of the Complete Specifications are advertised.

Complete Specifications thus advertised as accepted are open to inspection at the Patent Office immediately, and to opposition within two months of the said dates.

" 23,537. Macpherson and Heys. Process and means for removing insoluble soaps produced in or upon fabrics washed in hard or sea water. Nov. 16.

" 23,666. Wiener. Process of waterproofing and ornamenting textile fabrics. Nov. 17.

" 23,787. Brandt. Method of impregnating absorbent materials, textiles, paper, &c., with resins, fatty acids and the like. [Ger. Appl., Nov. 19, 1904.]* Nov. 18.

" 24,126. Crepelle-Fontaine. Apparatus for bleaching and creaming fabrics. [Fr. Appl., Nov. 26, 1904.]* Nov. 22.

[C.S.] 25,166 (1904). Calico Printers' Association, Ltd., and Warr. Treating vegetable fibres, chiefly cotton, to render them less inflammable. Nov. 22.

" 25,167 (1904). Calico Printers' Association, Ltd., and Warr. Treating vegetable fibres, chiefly cotton, to render them less inflammable. Nov. 22.

" 4371 (1905). Bastin. Apparatus for washing wool, &c. Nov. 29.

" 6332 (1905). Wilding Bros., Ltd., and Nelson. Means for producing a wavy or watered pattern on woven fabrics. Nov. 29.

" 7592 (1905). Johnson (Badische Anilin und Soda Fabrik). Manufacture of discharging agents. Nov. 22.

" 10,677 (1905). Johnson (Badische Anilin und Soda Fabrik). See under IV.

" 17,960 (1905). Kelling. Machine for washing or dyeing carpets. Nov. 29.

VI.—COLOURING WOOD, PAPER, LEATHER, ETC.

(Continued from page 1137.)

[C.S.] 24,456 (1904). Chapal Frères et Cie. Machines for dyeing furs and carotting skins. Nov. 22.

" 17,338 (1905). Lamb and Rennie. Printing on leather. Nov. 22.

VII.—ACIDS, ALKALIS, AND SALTS.

(Continued from page 1197.)

[A.] 23,717. Stoneham and Pearson. Manufacture of cyanides and ammonia. Nov. 17.

" 23,807. Stoneham and Pearson. Manufacture of cyanides and ammonia. Nov. 18.

" 23,836. Van Eyndhoven. Treatment of the waste gases from the manufacture of ammonium sulphate or chloride. Nov. 18.

" 23,841. Gaillard. Process of concentrating sulphuric acid.* Nov. 18.

" 24,000. Stoneham and Pearson. Manufacture of cyanides and ammonia. Nov. 21.

" 24,001. Stoneham and Pearson. Manufacture of cyanides and ammonia. Nov. 21.

" 24,144. Mewes. Process for liquefying air and winning oxygen. [Ger. Appl., Nov. 27, 1904.]* Nov. 22.

" 24,226. Bacon. Manufacture of crystallised sodium monosilicate. Nov. 23.

" 24,267. Brentnall. Manufacture of aluminium hydrate and of aluminium salts from disused bricks, &c., made from clay and from burnt clays. Nov. 24.

" 24,330. Jaubert. Preparation of oxygen by the decomposition of oxygenated salts. [Fr. Appl., Dec. 7, 1904.]* Nov. 24.

" 24,422. Knudsen. Treatment of liquid air. Nov. 25.

[C.S.] 25,010 (1904). Thompson (Westdeutsche Thomas-phosphat Werke). See under XI.

VIII.—GLASS, POTTERY, AND ENAMELS.

(Continued from page 1198.)

[A.] 23,714. Pitt. Manufacture of coloured glass. Nov. 17.

IX.—BUILDING MATERIALS, CLAYS, MORTARS, AND CEMENTS.

(Continued from page 1198.)

[A.] 23,816. Peters. Manufacture of Portland cement and apparatus therefor. Nov. 18.

" 24,042. Hewitt and Goreham. Machines for testing cement and like substances. Nov. 21.

" 24,219. Gardeur. Manufacture of artificial sandstone. Nov. 23.

" 24,224. Klinge and Schourup. Manufacture of artificial stones and similar building materials.* Nov. 23.

" 24,267. Brentnall. See under VII.

[C.S.] 21,253 (1904). Reavell. Manufacture of artificial stone. Nov. 22.

" 9496 (1905). Bohne and Herrmann. Process of preparing wood for polishing purposes. Nov. 29.

" 16,166 (1905). Hassam and Pevey. Pavement and process of laying the same. Nov. 29.

X.—METALLURGY.

(Continued from page 1198.)

- [A.] 23,319. Beaumont. Apparatus for recovering gold from disintegrated ores. Nov. 13.
- „ 23,408. Asbeck. Process for obtaining lead and silver from their ores. Nov. 14.
- „ 23,450. Swinburne. Treatment of poor ores. Nov. 15.
- „ 23,592. Henning. Process for manufacturing foundry pig iron. [Ger. Appl., Nov. 17, 1904.]* Nov. 16.
- „ 23,648. Cowper-Coles. Process for the alloying and amalgamation of metals. Nov. 17.
- „ 23,783. Davies. Flux for the treatment of cast iron and other metals. Nov. 18.
- „ 23,860. Hannay. Treatment of galena for the production of white lead and the extraction of silver. Nov. 20.
- „ 23,879. Sulman, Picard and Ballot. Ore concentration. Nov. 20.
- „ 23,977. MacIvor and Fradd. Treatment of sulphide ores containing zinc. Nov. 21.
- „ 24,003. Lake (Parker). Producing metallic iridium.* Nov. 21.
- „ 24,068. Charles. Zinc smelting. Nov. 22.
- „ 24,124. Simson. Process for treating and annealing metals. Nov. 22.
- „ 24,129. Van der Heyden. Reduction of metalliferous ores. Nov. 22.
- „ 24,238. Ogde. Method of treating complex ores (sulphides) containing copper, zinc and lead. Nov. 23.
- [C.S.] 17,407 (1904). Wolf. Separation of metals from their ores. Nov. 22.
- „ 17,660 (1904). Davies and Clark. Method of uniting or coating iron and steel with other metals and fluxes therefor. Nov. 22.
- „ 21,790 (1904). Goode, Mitchell, and Briquette (Minerals Binding) Co., Ltd. Composition for briquetting. Nov. 22.
- „ 3225 (1905). Hodgkinson. Removal of copper and nickel from iron or steel surfaces. Nov. 22.
- „ 8386 (1905). Baggaley, Allen, and Lindquist. Method of smelting ores and separating mattes and of recovering mineral values from slag. Nov. 22.
- „ 15,055 (1905). Ganz und Co., Eisengiesserei und Maschinenfabr., A.-G. *See under* XI.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

(Continued from page 1198.)

- [A.] 23,312. Cowper-Coles. Electro-deposition of copper and other metals. Nov. 13.
- „ 23,402. Girod. Electric furnaces. [Fr. Appl., Dec. 24, 1904.]* Nov. 14.

- [A.] 23,474. Roberts and Jaffray. Electro-deposition of metals, alloys and the like. Nov. 15.
- „ 23,526. Platschick. Electrical furnaces. Nov. 15.
- [C.S.] 25,010 (1904). Thompson (Westdeutsche Thomasphosphat Werke). Process of producing nitric acid by aid of electricity. Nov. 22.
- „ 15,055 (1905). Ganz und Co., Eisengiesserei und Maschinenfabr., A.-G. Extracting metals from ores and other metalliferous material by electrolytic means and apparatus therefor. Nov. 29.
- „ 20,898 (1905). Rüber. Electrolytic apparatus. Nov. 29.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

(Continued from page 1198.)

- [A.] 4092A. Krebitz. Process for converting an insoluble soap into soluble soda or potash soap. Nov. 17.
- „ 23,546. Macpherson and Heys. Detergent for use with hard and salt waters. Nov. 16.
- „ 23,670. Kremer, and Ges. f. Abwässerklärung. Apparatus for the recovery of fats and the like.* Nov. 17.
- „ 24,030. Kremer, and Ges. f. Abwässerklärung. Apparatus for the recovery of fats and the like.* Nov. 21.
- „ 24,131. Van der Heyden. Soap. Nov. 22.
- „ 24,318. Oppenheimer and Kent. *See under* III.
- „ 24,319. Oppenheimer and Kent. *See under* III.
- [C.S.] 3763 (1905). Grice. Soap tablets. Nov. 22.
- „ 6161 (1905). Rivoir. Apparatus for the manufacture of soap. Nov. 20.

XIII.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(Continued from page 1199.)

(A.)—PIGMENTS, PAINTS.

- [A.] 23,633. Griffiths. Pigments. Nov. 16.
- „ 23,860. Hannay. *See under* X.
- „ 24,343-5. Gay and Co., Ltd., and Tervet. *See under* XVIII B.
- [C.S.] 25,092 (1904). Flaek (Williams). Writing ink. Nov. 22.

(B.)—RESINS; VARNISHES.

- [A.] 23,744. H. C. Meyer, jun., Kommandit-Ges. auf Aktien. Process for removing resin from the surface of rattan. [Ger. Appl., Dec. 5, 1904.]* Nov. 17.

(C.)—INDIA-RUBBER.

- [A.] 23,290. Bonnefin. Process for extracting india-rubber from any plant or part of a plant. Nov. 13.

XIV.—TANNING, LEATHER, GLUE, SIZE, ETC.

(Continued from page 1199.)

- [A.] 23,299. Flöring and Lenneberg. Process for rendering chrome leather waterproof and durable. Nov. 13.
- „ 23,370. Feilmann. Manufacture of colloidal preparations. Nov. 14.
- „ 23,397. Betz. Process for producing a hornlike substance from casein. Nov. 14.
- [C.S.] 24,456 (1904). Chapal Frères et Cie. *See under VI.*
- „ 5748 (1905). Koepff. Apparatus for drying gelatin, glue, paste goods, brewers' grains, &c. Nov. 22.

XV.—MANURES, ETC.

(Continued from page 1199.)

- [C.S.] 18,990A (1905). Gooding. *See under XVIII.A.*

XVI.—SUGAR, STARCH, GUM, ETC.

(Continued from page 1199.)

- [C.S.] 10,273 (1905). Roy. Treatment of massecuite and apparatus therefor. Nov. 22.

XVII.—BREWING, WINES, SPIRITS, ETC.

(Continued from page 1199.)

- [A.] 23,727. Haslam. Apparatus for the treatment of beer. Nov. 17.
- [C.S.] 16,478 (1905). Scholvien. Non-alcoholic beverages resembling beer. Nov. 22.

XVIII.—FOODS; SANITATION, WATER PURIFICATION; & DISINFECTANTS.

(Continued from page 1199.)

(A.)—FOODS.

- [A.] 23,391. Lake (Nordyke and Marmon Co.). Treatment of cereals and apparatus therefor. Nov. 14.
- „ 23,452. Hogarth. Treatment of wheat or flour and other cereals. Nov. 15.
- „ 23,460. Hogarth. Treatment of wheat or flour and other cereals. Nov. 15.
- „ 23,710. Parker. Manufacture of extract of germ of wheat for use in making cereal foods. Nov. 17.
- „ 23,982. Salomons. Preservation of alimentary substances.* Nov. 21.
- „ 24,245. Rozer. Apparatus for automatic acetication.* Nov. 24.
- „ 24,414. Meinel. Manufacture of malt-containing chocolate. Nov. 25.
- [C.S.] 27,718 (1904). Haccius. Manufacture of dry milk powder. Nov. 29.

- [C.S.] 29,367 (1904). Mills (Bévenot and De Neven). Desiccation of milk, cream, casein, and their derivatives. Nov. 29.

- „ 28 (1905). Hatmaker. Eggs and egg-containing substances in dry form and process for obtaining same. Nov. 22.
- „ 18,990A (1905). Gooding. Treatment of film dirt and the like, and production of a cattle food and a manurial product therefrom. Nov. 29.

(B.)—SANITATION; WATER PURIFICATION.

- [A.] 24,322. Bordigoni. Destruction or bacterial treatment of sewage and purification of effluent or residual liquids.* Nov. 24.
- „ 24,343. Gay and Co., Ltd., and Tervet. Means for conveying away dust of white lead or other injurious material as it is being shovelled out from casks. Nov. 24.
- „ 24,344. Gay and Co., Ltd., and Tervet. Helmets applicable especially for the prevention of lead poisoning. Nov. 24.
- „ 24,345. Gay and Co., Ltd., and Tervet. Means for preventing escape of white lead or other injurious dust into the outer air during its preparation or grinding. Nov. 24.
- „ 24,402. Schmidt. Clearing vat for sewage.* Nov. 25.
- „ 24,412. McPhail. Purification of liquids and separation of bodies contained therein. Nov. 25.
- „ 24,435. Krüger. Water purifying apparatus.* Nov. 25.
- [C.S.] 645 (1905). Klecan and Laska. Removing and preventing formation of scale in boilers. Nov. 22.

XIX.—PAPER, PASTEBOARD, ETC.

(Continued from page 1199.)

- [A.] 23,399. Macnaughton. Impts. in paper making apparatus to separate sand, metal, &c., from the pulp.* Nov. 14.
- „ 23,748. Beresford. Manufacture of half-stuff from peat moss as a basis for millboard and paper making. Nov. 17.
- „ 23,787. Brandt. *See under V.*
- [C.S.] 13,184 (1904). Trotman. Watermarking of paper. Nov. 22.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

(Continued from page 1199.)

- [A.] 23,718. Newton (Bayer and Co.). Manufacture of dialkylbarbituric acids. Nov. 17.
- „ 24,194. Siepermann. Preparation of sulphocarbamidophenylate of diethylamine or amines of a similar nature. Nov. 23.
- [C.S.] 2348 (1905). Johnson (Badische Anilin und Soda Fabrik). Manufacture of derivatives of aldehydes. Nov. 22.
- „ 6948 (1905). Zimmermann (Chem. Fabr. auf Actien, vorm. E. Schering). Manufacture of salicylic acid glycerine formal ester. Nov. 29.
- „ 11,926 (1905). Lieber. Radium surfaces. Nov. 29.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

(Continued from page 1200.)

[C.S.] 9324 (1905). Abel (Act.-Ges. f. Anilinfabr.). Sensitising layers of gelatin, glue or the like for the pigment and like photographic processes. Nov. 29.

XXII.—EXPLOSIVES. MATCHES. Etc.

(Continued from page 1200.)

[A.] 23,238. Bennett and Mastin. Explosives for guns. Nov. 13.

„ 23,895. Silberrad. Explosives.* Nov. 20.

[C.S.] 19,112 (1905). Smith. Explosives and process of manufacturing the same. Nov. 29.

JOURNAL OF THE Society of Chemical Industry.

A RECORD

FOR ALL INTERESTED IN CHEMICAL AND ALLIED MANUFACTURES.

ISSUED TWICE A MONTH.

No. 24.—Vol. XXIV.

DECEMBER 30, 1905.

No. 24.—Vol. XXIV.

Subscription of Members 25 - per annum ;
Entrance Fee 21 - ;
Election by the Council.

Price to Non-Members 36 - per annum ;
To Members 25 - per Set of extra or back numbers.
Single copies (Members and Subscribers only)
1882—1901, 2 6 each ; 1902 *et seq.*, 1 9 each.

The Society of Chemical Industry.

Past Presidents :

Sir Henry E. Roscoe, B.A., D.C.L., LL.D., Ph.D., F.R.S.	1881—1882.
†Sir Frederick A. Abel, Bart., K.C.B., G.C.V.O., D.C.L., D.Sc., F.R.S.	1882—1883.
†Walter Weldon, F.R.S.	1883—1884.
W. H. Perkin, LL.D., Ph.D., F.R.S.	1884—1885.
E. K. Muspratt	1885—1886.
David Howard	1886—1887.
Sir James Dewar, M.A., LL.D., F.R.S.	1887—1888.
Ludwig Mond, Ph.D., F.R.S.	1888—1889.
†Sir Lowthian Bell, Bart., F.R.S.	1889—1890.
†E. Rider Cook	1890—1891.
J. Emerson Reynolds, M.D., D.Sc., F.R.S. Sir John Evans, K.C.B., D.C.L., LL.D., Sc.D., F.R.S.	1891—1892.
1892—1893.	
†E. C. C. Stanford	1893—1894.
T. E. Thorpe, C.B., LL.D., Sc.D., Ph.D., F.R.S.	1894—1895.
Thomas Tyrer	1895—1896.
†Edward Schunck, Ph.D., F.R.S.	1896—1897.
Frank Clowes, D.Sc.	1897—1898.
George Beilby	1898—1899.
C. F. Chandler, D.Sc., M.D., Ph.D., LL.D. Sir Jos. W. Swan, D.Sc., M.A., F.R.S.	1899—1900.
Ivan Levinstein	1900—1901.
Sir W. Ramsay, K.C.B., D.Sc., LL.D., F.R.S. Wm. H. Nichols, M.S., LL.D., D.Sc.	1901—1903.
1903—1904.	
1904—1905.	

† Deceased.

LIST OF COUNCIL, 1905—1906.

President : Dr. Edw. Divers, F.R.S.

Vice-Presidents :

Dr. L. Baekeland.	Dr. J. Lewkowitsch.
J. Carter Bell.	N. H. Martin.
Dr. Virgil Coblenz.	Max Muspratt.
Prof. W. R. E. Hodgkinson.	Dr. Wm. H. Nichols.
David Howard.	T. J. Parker.
Ivan Levinstein.	Sir Wm. Ramsay, K.C.B., F.R.S.

Ordinary Members of Council :

Dr. J. T. Dunn.	Dr. K. E. Markel.
Oscar Guttman.	B. E. R. Newlands.
H. Hemingway.	Prof. W. J. Pope, F.R.S.
Prof. W. R. Lang.	Sir Boverton Redwood.
A. R. Ling.	Walter F. Reid.
J. S. McArthur.	Dr. W. S. Squire.

Sectional Chairmen and Secretaries :

Prof. Percy F. Frankland, F.R.S.	BIRMINGHAM.	F. R. O'Shaughnessy.
Dr. F. J. Smale.	CANADIAN.	Alfred Burton.
Eustace Carey.	LIVERPOOL.	W. Roscoe Hardwick.
A. Gordon Salamon.	LONDON.	Julian L. Baker.
Dr. G. H. Bailey.	MANCHESTER.	Julius Hübner.
Prof. H. Louis.	NEWCASTLE.	Dr. F. C. Garrett.
Henry Howard.	NEW ENGLAND.	Alan A. Clafin.
Dr. Russell W. Moore.	NEW YORK.	Dr. H. Schweitzer.
J. M. C. Paton.	NOTTINGHAM.	S. R. Trotman.
David Perry.	SCOTTISH.	Dr. Thos. Gray.
Prof. A. Liversidge, F.R.S.	SYDNEY, N.S.W.	T. U. Walton.
Prof. H. B. Procter.	YORKSHIRE.	Thos. Fairley.

Honorary Treasurer :

Samuel Hall, East London Soap Works, Bow, E.

Hon. Foreign Secretary :

Dr. Ludwig Mond, F.R.S.

General Secretary :

Charles G. Cresswell, 59, Palace Chambers, Westminster, S.W.

THE JOURNAL.

Publication Committee :

The President.

Julian L. Baker.
G. Beilby.
J. Carter Bell.
Joseph Bernays, M.I.C.E.
H. Brunner.
Sir John Evans, K.C.B., F.R.S.
T. Fairley.
Prof. A. G. Green.
Samuel Hall.
John Heron.
D. B. Hewitt, M.D.
Prof. W. R. E. Hodgkinson,
Ph.D.
E. Grant Hooper.
David Howard.
Julius Hübner.
Prof. A. K. Huntington.
Wm. Kellner, Ph.D.

Charles A. Kerne, M.Sc., Ph.D.
Ivan Levinstein.
J. Lawkowitsch, Ph.D.
A. R. Ling.
W. Maenab.
N. H. Martin.
B. E. R. Newlands.
John Pattinson.
Prof. W. J. Pope, F.R.S.
F. B. Power, Ph.D.
Prof. H. R. Procter.
Sir Wm. Ramsay, K.C.B., F.R.S.
Sir Boverton Redwood, D.Sc.
Walter F. Reid.
John Spiller.
W. S. Squire, Ph.D.
L. T. Thorne, Ph.D.
Thomas Tyrer.

Editor :

Watson Smith, 34, Upper Park Road, Haverstock Hill, N.W.

	L. J. de Whalley, B.Sc. XVI.

Birmingham Section.

Chairman: Percy F. Frankland.

Vice-Chairmen:

W. Waters Butler, Frank E. Lott, Alex. E. Tucker.

Committee:

Robt. B. Batty.	Edward Jackson.	Walter Rosenhain.
Wm. B. Davidson.	Thos. Lawton.	Harry Silvester.
Alex. Findlay.	Frank Platten.	Thos. Turner.
Henry L. Heathcote.	T. Slater Price.	

Hon. Local Secretary and Treasurer:

F. R. O'Shaughnessy, Tyburn, nr. Birmingham.

Canadian Section.

Chairman: F. J. Smale.

Vice-Chairmen:

W. H. Ellis, A. McGill, B. J. Harrington.

Committee:

J. H. Bowman.	Chas. H. Heys.	M. J. Taylor.
Jeffrey H. Burland.	W. R. Lang.	Harold Vander Linde.
Thos. Davies.	W. Lash Miller.	W. H. Van Winckel.
Milton L. Hersey.	Jas. P. Murray.	

Hon. Treasurer: J. W. Bain.

Hon. Local Secretary:

Alfred Burton, 44, York Street, Toronto.

Liverpool Section.

Chairman: Eustace Carey.

Vice-Chairman: Frank Tate.

Committee:

T. Lewis Bailey.	J. T. Conroy.	C. Longuet Higgins.
J. Campbell Brown.	H. E. Davies.	E. L. Peck.
Arthur Carey.	A. Foden.	W. Collingwood
G. C. Clayton.	G. Watson Gray.	Williams.

Hon. Treasurer: W. P. Thompson.

Hon. Local Secretary:

W. R. Hardwick, 13, Batavia Buildings, Hackins Hey, Liverpool.

London Section.

Chairman: A. Gordon Salamon.

Vice-Chairman: R. J. Friewell.

Committee:

E. J. Bevan.	D. L. Howard.	Boverton Redwood.
H. G. Colman.	G. C. Jones.	Walter F. Reid.
J. N. Connah.	A. R. Ling.	F. Napier Sutton.
M. O. Forster.	B. E. R. Newlands.	Chas. Wightman.
Oscar Guttman.	Wm. Pearce.	

Hon. Local Secretary:

Julian L. Baker, Stainesbury Holt, Kingston Road, Staines.

SESSION 1905-1906.

Monday, December 4, 1905:—

W. A. Caspari, Ph.D. "Notes on Gutta Percha and Balata."
 R. Seligman, Ph.D., and F. J. Willott. "The Determination of Zinc in Zinc-Aluminium Alloys."
 R. Seligman, Ph.D. "Distilled Water Supply for 'Works' Laboratories."
 C. J. Dickinson-Gair. "The Estimation of Naphthalene in Coal Gas."
 Bernard F. Howard, A.I.C., and E. Perry. "Salts of the Alkaloid Cinchonamine."

Manchester Section.

Chairman: G. H. Bailey.

Vice-Chairman: F. Scudder.

Committee:

J. Barnes.	B. Hart.	J. H. Lester.
J. Bürger.	W. B. Hart.	H. Porter.
W. H. Coleman.	R. S. Hutton.	T. Stenhouse.
J. Grossmann.	W. E. Kay.	W. Thomson.

Hon. Local Secretary:

Julius Hübner, Ash Villa, Cheshire Hulme, Cheshire.

Newcastle Section.

Chairman: H. Louis.

Vice-Chairman: J. T. Dunn.

Committee:

P. P. Bedson.	John Pattinson.	Harry Smith.
H. S. Collins.	W. W. Proctor.	A. Spiller.
Ellwood Holmes.	W. L. Rennoldson.	J. E. Stead.
N. H. Martin.	Geo. Sisson.	C. E. Stuart.

Hon. Local Secretary and Treasurer:

F. C. Garrett, Armstrong College, Newcastle-on-Tyne.

New England Section.

Chairman: Henry Howard.

Vice-Chairman: F. E. Atteaux.

Committee:

C. R. Borland.	L. A. Olney.	Charles R. Sanger.
W. A. Gallup.	Edw. D. Pearce.	F. H. Thorp.
A. F. Hobbs.	A. Reuterdahl.	W. H. Walker.
Lawrence S. James.	F. C. Robinson.	W. J. Webber.
J. W. Loveland.		

Hon. Local Treasurer: Godfrey L. Cabot.

Hon. Local Secretary:

Official Notices.

COMMUNICATIONS.

Authors of communications read before the Society, or any of its Local Sections, are requested to take notice that under Rule 43 of the Bye-laws the Society has the right of priority of publication for three months of all such papers. Infringement of this Bye-law renders papers liable to be rejected by the Publication Committee, or ordered to be abstracted for the Journal, in which case no reprints can be furnished to the author.

SIXTH INTERNATIONAL CONGRESS OF APPLIED CHEMISTRY, ROME, 1906.

The Sixth International Congress of Applied Chemistry will be held in Rome in April, 1906, during Easter week. All communications should be addressed to the General Secretary, Prof. Vittorio Villavecchia, Via Panisperna, 89, Rome.

Members are reminded that the subscription of 25s. for 1906, payable on January 1st, should be sent in good time to the Hon. Treasurer (Mr. Samuel Hall) in order to ensure continuity in the receipt of the Society's Journal. Any changes of address for the new List of Members now in course of preparation should reach the General Secretary not later than January 31st, 1906.

DECENNIAL INDEX, 1896-1905.

A Collective Index to the first fourteen volumes of the Journal (1882-1895), a volume of 550 pages, was published in 1899; a few copies of this are still left, price 10s. A second volume, embracing the period 1896-1905, is now in preparation, and will be ready for printing in 1906. It will contain both a subject matter and authors' names portion, and will be a volume of about 900 pages, uniform in size with the Journal. As the number of copies to be printed will depend on the number of applications from members, the Treasurer is prepared to receive subscriptions at the rate of 10s. each copy. A form of application for this purpose will shortly be issued.

List of Members Elected.

December 22nd, 1905.

Armstrong, Dr. E. F., Lodge Hotel, King's Road, Reading, Works Chemist.
 Arnold, Frank L., 32, School Street, North Woburn, Mass., U.S.A., Chemist.
 Baer, Ivan F., 20, Gilbert Street, South Framingham, Mass., U.S.A., Chemist.
 Bampton, George F., Room 24, 68, Essex Street, Boston, Mass., U.S.A., Chemist.
 Brunt, R.A., Box 121, Windsor, Ont., Canada, Sugar Chemist.
 Chapman, D. L., 10, Parsonage Road, Withington, Manchester, Demonstrator in Chemistry.
 Coes, Charles S., 119, East River Street, Hyde Park, Mass., U.S.A., Oil Chemist.
 Ellis, Carleton, 168, South Broadway, White Plains, N.Y., U.S.A., Chemical Engineer.
 Graham, Samuel L., Rome, Ga., U.S.A., Chemist and Assayer.
 Grant, Alexander, 13, Kilgraston Road, Edinburgh, Baker.
 Harrington, John H., Naval Smokeless Powder Works, Indian Head, Md., U.S.A., Chemist.
 Humel, Edward J., 950, Clark Avenue, Cleveland, Ohio, U.S.A., Chemist.
 Jenks, George E., Grasselli, N.J., U.S.A., Chemist.
 Jones, W. H. Matthews, City Surveyor's Offices, The Town Hall, Chester, Deputy Surveyor.
 Kurt, Franklin T., 458, Boylston Street, Boston, Mass., U.S.A., Prof. of Chemistry (B.Y.M.C.A.).

Lyster, Benton R., Northern Chemical Works, Whitefield, N.H., U.S.A., Chemical Manufacturer.
 O'Mahony, Dr. C. S., c/o The Union Pacific Tea Co., 79-80, Winter Street, New York City, U.S.A., Chemist.
 Philp, R. C., Royal College of Science, South Kensington, S.W., Assayer and Metallurgist.
 Ransom, H. B., 78, St. George's Square, London, S.W., Engineer.
 Reid, Dr. John H., 11, Glover Street, Birkbehead, Chemist.
 Rothwell, Robert R., 88, George Street, Moss Side, Manchester, Chemistry and Physics Teacher.
 Rüger, Richard, 9, Ash Leigh, Anfield, Liverpool, Chemist.
 Schill, Dr. Emil, c/o G. Siegle Co., 79, Duane Street, New York City, U.S.A., Chemist.
 Thresh, Dr. John C., Chelmsford, Essex, Sanitary Expert and Medical Officer of Health.
 Tindall, W. B., 39, St. Mary Street, Toronto, Canada, Secretary and Treasurer.

Changes of Address.

When notifying new addresses, members are requested to write them distinctly, and state whether they are temporary or permanent. Multiplication of addresses is also to be avoided as tending to create confusion. When sending subscriptions, the use of the form attached to the application helps in the verification of addresses, on which the safe delivery of the Journal depends.

Barker, Perry, 1/o La Salle; c/o Peabody Coal Co., 215, Dearborn Street, Chicago, Ill., U.S.A.

Meeting held at Burlington House on Monday, December 4th, 1905.

MR. A. GORDON SALAMON IN THE CHAIR.

NOTES ON GUTTA PERCHA AND BALATA.

BY DR. W. A. CASPARI.

The following observations were made with the object, firstly, of extending the knowledge of the hydrocarbons of gutta percha and balata generally, and, secondly, of bringing the chemistry of them into line, in certain respects, with that of india-rubber.

Ten marketable varieties of raw gutta percha, outwardly different, were available. Of balata, which is less adulterated and is understood to vary little in quality for a given year, a specimen imported in 1902 was taken. These were mechanically freed from adventitious mineral and vegetable matter and rolled into porous sheets containing several per cent. of water, in which condition they very readily parted with their resinous components on extraction with ether or petroleum ether. The proportion of hydrocarbon to resin varied in the gutta perchas from 61.4:38.6 to 39.6:60.4, whilst in the balata it was 46.5:53.5. The india-rubber employed in comparative experiments was a specimen of Island Para, which was quite free from dirt and yielded 2 per cent. of empyreumatic and resinous matter to acetone.

THE HYDROCARBONS.

These will be referred to later as gutta, balata and caoutchouc respectively, under the generic term of poly-pene. The first step towards preparing gutta and balata in the pure state was to eliminate the small amount of dirt still present. The extracted materials were dissolved in benzene and the insoluble matter allowed to settle. The solutions are too viscid to be easily filtered, but they become perfectly clear on standing for 24 hours, especially after being shaken up with a few drops of water. The hydrocarbon may then be precipitated by alcohol or acetone. The colour of the clear solutions varied from sherry-brown to pale yellow; it appears to increase with the small amount of ash (0.3–0.6 per cent.) present, and

is not removed by numerous re-solutions and re-precipitations; in quite dilute solution (1:100), however, the colouring matter is deposited as a fine powder on standing for some months. Balata was almost water-white in solution. On precipitation by alcohol, the bulk of the hydrocarbon comes down as a stringy mass of the texture of loofah, whilst the mother-liquor is milky and deposits the remainder in a finely-divided state on standing. The essential difference between these two forms claimed by Oesterle (this J., 1893, 609 and 848) was not confirmed. It appears to be merely a question of dilution whether stringy or fine gutta will be precipitated, and by starting with sufficiently dilute solutions a yield of the latter, without any clot, can always be obtained. The limit was found to be about 0.8 gr. in 100 c.c., and from solutions stronger than this the formation of a clot is inevitable. Caoutchouc, as is well known, contains a skeleton of matter which swells up, but remains insoluble in benzene and other solvents; from the clear solution an elastic coagulum is precipitated, which runs together to a comparatively dense mass.

Precipitated gutta readily absorbs oxygen, and is best dried and preserved in hydrogen. This precaution being taken, analysis by combustion shewed that precipitated guttas were never free from oxygen; a specimen which was five times reprecipitated and then dried in hydrogen still contained 1 per cent. The oxidised constituent is not removed by extraction with petroleum ether and is not, therefore, a resin. It seems probable that the first oxidation products of gutta are colloids not far removed in their general properties from the parent hydrocarbon.

The final purification is effected by a process resembling recrystallisation, for which ether, benzene, or ligroin may be employed. The pure hydrocarbon is thus obtained in white flakes or granules. Analyses of various guttas and balata, thrice deposited from benzene, confirmed the formula $(C_5H_8)_n$. The hydrocarbons derived from the ten gutta perchas and from balata were identical in general properties. The only difference observed was that solutions of equal strength showed slight differences in viscosity, that of balata having about twice the viscosity of average gutta solution; they are vastly more mobile, however, than corresponding caoutchouc solutions. Gutta is of leathery consistency and almost destitute of elasticity; in this respect it differs sharply from caoutchouc, which is highly elastic. At temperatures well below 100° it becomes soft, and can be kneaded into any desired form, whilst caoutchouc becomes sticky and moderately plastic, but still retains some resiliency. At higher temperatures the two hydrocarbons tend to approximate in behaviour. Gutta is soluble in ether, chloroform, carbon tetrachloride, carbon bisulphide, and hydrocarbons. Boiling sodium-proof ether takes up a small percentage of gutta and deposits the bulk in small flakes on cooling. The presence of water or alcohol in small amounts renders ether almost a non-solvent. In $CHCl_3$, CCl_4 and CS_2 gutta swells somewhat to a transparent mass and then yields, on shaking, a homogeneous solution in the cold. In benzene and its homologues gutta behaves differently; a quantity of solvent is taken up with swelling, but the resulting mass is not dispersed throughout the liquid on shaking unless the temperature be raised to 40° or higher. Benzene solutions of gutta are super-saturated below 20°; on local freezing, and often spontaneously, most of the gutta separates out in hyaline, gelatinous flakes which, when pressed dry, still contain half their weight of solvent. Apparently there is a temperature limit below which an insoluble gutta-benzene complex is favoured and above which clear homogeneous solutions are stable. The solubility of gutta in paraffins increases with their molecular weight; cold petroleum ether of 30°–40° B.P. is a non-solvent and is useful for the assay of resin by extraction. In the higher fractions gutta dissolves easily on boiling, but it does not absorb them in the cold. Ligroin of B.P. 60°–80°, especially, is a very suitable "recrystallising" medium, from which the gutta deposits in opaque granules on cooling. The above are also solvents for caoutchouc; this hydrocarbon swells up to an enormous volume, and the resulting, jelly-fish-like mass goes into solution on shaking, at any temperature. There is hardly a liquid, solvent or non-

solvent, which caoutchouc does not absorb with swelling. It does not grain out of solutions.

The specific gravity of the several guttas and balata was determined by precipitating in the finely divided state and floating in a suitably adjusted mixture of alcohol and water; it ranged between 0.9601 and 0.9619. Caoutchouc, which cannot be precipitated in fine flakes, does not lend itself to this procedure.

Action of heat.—Gutta never attains a truly fluid condition. It becomes dough-like on warming, but the mass does not melt to a continuous bubble-free mass before decomposition sets in. When finely divided gutta is heated in ordinary melting-point tubes, the softening-point at 53° – 60° is marked by the hitherto opaque particles becoming translucent. At 185° – 190° vapour is evolved, and the decomposing substance runs together to a fused mass.

ADDITION PRODUCTS.

Chlorine.—Solutions of polyprene absorb chlorine with avidity. The nature of the solvent is not a matter of indifference, since, if it forms hydrochloric acid in reaction with chlorine, partial addition of HCl to the polyprene may take place. Thus, in benzene, products were obtained which contained fluctuating, and usually comparatively low, percentages of Cl. On passing pure dry chlorine into solutions of gutta, balata, and caoutchouc in dried carbon tetrachloride to saturation, most of the product separated out as a gummy mass, being easily soluble in hot carbon tetrachloride, but only sparingly in cold. There was a marked disengagement of hydrochloric acid. The liquids were poured into alcohol and the resulting clot redissolved and reprecipitated. By dropping dilute benzene or chloroform solutions into alcohol, the chlorinated bodies were obtained in small white flakes, which were dried *in vacuo*. They are toughish and of the consistency of bread crumbs. Below 100° they become plastic, and at 150° they darken with evolution of hydrochloric acid. They dissolve easily in the ordinary polyprene solvents.

Gutta:—0.1939 gr. gave 0.2801 CO_2 and 0.698 H_2O .

0.1788 gr. gave 0.4116 AgCl.

C = 39.45; H = 4.00; Cl = 56.98 per cent.

Balata:—0.1865 gr. gave 0.2466 CO_2 and 0.0624 H_2O .

0.1815 gr. gave 0.4418 AgCl.

C = 36.08; H = 3.72; Cl = 60.17 per cent.

Caoutchouc:—0.1767 gr. gave 0.2580 CO_2 and 0.0645 H_2O .

0.1276 gr. gave 0.2876 AgCl.

C = 39.84; H = 4.06; Cl = 55.79 per cent.

Required for $\text{C}_{20}\text{H}_{36}\text{Cl}_{14}$:—C = 40.38; H = 4.03; Cl = 55.58 per cent.

From these figures, it is evident that molar substitution than addition has taken place: the formula $\text{C}_{30}\text{H}_{36}\text{Cl}_{14}$ would indicate that 12 atoms of chlorine have been substituted, and two added, in the molecule $\text{C}_{30}\text{H}_{48}$.

Bromine.—Here again, the use of benzene as solvent leads to low bromine-contents (60–62 per cent.). On conducting the reaction in dried chloroform, white amorphous bodies, very much resembling the above chlorination-products, were obtained, not without a slight disengagement of HBr. They darken with evolution of hydrobromic acid at 130° .

Gutta:—0.1988 gr. gave 0.2102 CO_2 and 0.0658 H_2O .

0.2044 gr. gave 0.3242 AgBr.

C = 28.68; H = 3.68; Br = 67.50 per cent.

Balata:—0.1412 gr. gave 0.1558 CO_2 and 0.0493 H_2O .

0.1773 gr. gave 0.2719 AgCl.

C = 30.08; H = 3.88; Br = 65.27 per cent.

Caoutchouc:—0.1688 gr. gave 0.1824 CO_2 and 0.0598 H_2O .

0.2114 gr. gave 0.3270 AgBr.

C = 29.48; H = 3.94; Br = 65.82 per cent.

Required for $\text{C}_{30}\text{H}_{46}\text{Br}_{10}$:—C = 29.83; H = 3.82; Br = 66.34 per cent.

Bromine, then, has not nearly the same tendency to substitute in the polyprene molecule as chlorine. From the above approximate formula, an unsaturation corresponding to eight atoms of bromine per $\text{C}_{30}\text{H}_{118}$ molecule is indicated.

Iodine.—When the hydrocarbons are subjected to the action of excess of iodine in dry chloroform solution, a jelly separates beneath a clean dark brown solution, and after a day or two, the jelly shrinks to a leathery mass.

Slight fumes of hydriodic acid are observed. By working with known weights of iodine, shaking up after three days with potassium iodide solution, and titrating, the iodine absorption values of 104, 105, and 92 for gutta, balata, and caoutchouc respectively were determined. But whereas compounds containing about 50 per cent. of iodine might be expected from these data, it was found that on shaking up and precipitating with alcohol, a great part of the iodine was liberated again. The bodies thus obtained are greyish-brown flakes, capable of being finely powdered.

Gutta:—0.2012 gr. gave 0.0459 AgI.

I = 12.11 per cent.

Balata:—0.2584 gr. gave 0.0618 AgI.

I = 12.92 per cent.

Caoutchouc:—0.1315 gr. gave 0.0304 AgI.

I = 12.49 per cent.

By precipitating only the clear liquid resulting from the reaction in chloroform, very similar bodies of a rather lighter colour were obtained.

Gutta:—0.1578 gr. gave 0.0361 AgI.

I = 12.49 per cent.

Balata:—0.1528 gr. gave 0.0380 AgI.

I = 13.47 per cent.

Caoutchouc:—0.1625 gr. gave 0.0382 AgI.

I = 12.72 per cent.

These substances are tolerably stable, and it thus appears that the bulk of the iodine absorbed in solution is held much more loosely than the residual 12–13 per cent. They shrink and darken at 180° , but do not give off notable quantities of iodine below 200° . Once isolated, they are insoluble in chloroform and all other solvents, though they swell up more or less.

Hydrochloric Acid.—Benzene solutions of gutta and of balata were saturated with gaseous hydrochloric acid and precipitated with alcohol. The resulting clots were redissolved and reprecipitated, yielding white leathery flakes easily soluble in benzene, chloroform, &c. They begin to decompose at 185° .

Gutta:—0.1893 gr. gave 0.4255 CO_2 and 0.1614 H_2O .

0.2303 gr. gave 0.2788 AgCl.

C = 61.26; H = 9.48; Cl = 28.92 per cent.

Balata:—0.1348 gr. gave 0.3014 CO_2 and 0.1118 H_2O .

0.2223 gr. gave 0.2628 gr. AgCl.

C = 61.00; H = 9.22; Cl = 29.20 per cent.

The behaviour of caoutchouc was found to be somewhat different. From benzene solutions hydrochloric acid gas brought down insoluble gelatinous flakes, which, after "drowning" in alcohol, yielded a friable substance capable of being finely powdered. It is easily soluble in chloroform and carbon bisulphide, but in benzene only swells without dissolving.

0.1026 gr. gave 0.2209 CO_2 and 0.0931 H_2O .

0.1690 gr. gave 0.2164 AgCl.

C = 58.72; H = 10.08; Cl = 31.72 per cent.

The difference in composition between gutta and caoutchouc hydrochlorides is not so great as might be expected from the difference in properties. The former correspond approximately to $\text{C}_{30}\text{H}_{45}(\text{HCl})_6$, which requires C = 61.00; H = 8.98; and Cl = 30.01 per cent.

All these halogenised derivatives are exceedingly inert chemically. Towards aqueous reagents especially their state of aggregation renders them very resistant. Heated under pressure with sodium ethylate, they all pass into coffee-coloured oxygenated bodies insoluble in all solvents; in no instance, however, were these obtained halogen-free, and therefore fit for analysis.

VULCANISATION.

Sulphur Chloride is absorbed by gutta and balata in the same way as by caoutchouc, and the resulting compounds closely resemble Weber's $\text{C}_{10}\text{H}_{16}\text{S}_2\text{Cl}_2$ (this J., 1894, 13, 14), but they only remotely approximate to this composition. Excess of sulphur chloride was mixed with benzene solutions (2:100) of the hydrocarbons; the former had been thrice refractionated from the purchased article, and sodium-proof benzene was used throughout. The liquids set to stiff jellies, balata rather more rapidly than gutta. The jellies were comminuted by squeezing through calico, repeatedly washed with benzene, and drowned in acetone. Hard light yellow granules, yielding impalpable white powders, free from uncombined sulphur,

were thus obtained. Hydrochloric acid was invariably given off. The sulphur—and chlorine—contents of two sets of preparations are appended; in I. the reagents were allowed to stand for half an hour, in II. over-night.

	I.	II.
Gutta { Sulphur	20.6	23.4
{ Chlorine	15.9	21.0
Balata { Sulphur	20.5	24.9
{ Chlorine	15.5	20.2

Sulphur was found to vulcanise gutta and balata very effectively. In default of machinery, the materials were incorporated by softening the hydrocarbons in benzene, mixing with 5–10 per cent. of powdered sulphur, driving off the solvent, and heating the mass in the steam-oven with frequent kneadings until tolerably uniform. It was then bound with canvas and subjected for three hours to 130° in an autoclave. The resulting substances were of firm, springy consistency; they were cut into strips and deprived of free sulphur by extraction with carbon bisulphide and acetone. Preparations containing 1.72–2.33 per cent. of sulphur became somewhat sticky on heating to 100°, and were, therefore, under-vulcanised. With 2.78 (gutta) and 2.69 (balata) per cent., however, they no longer resembled the parent hydrocarbons in any way. They were decidedly elastic, though less so than vulcanised caoutchouc; they swelled in solvents without dissolving; heated to 100° they showed no trace of plasticity or stickiness, but rather gained in elasticity. Traces of H_2S were evolved in vulcanisation. No vulcanising effect was observed when the hydrocarbons were boiled with sulphur in xylene or heated with sulphur in teluene to 150°.

To determine the maximum absorption of sulphur, vulcanisations were carried out as above with equal weights of hydrocarbon and sulphur for five hours at 130° (I.), and for ten hours at 160° (II.). The resulting ebonites were rasped to powder and extracted for 24 hours with acetone:—

- I. Gutta:—0.1800 gr. gave 0.4084 $BaSO_4$.
S = 31.18 per cent.
Balata:—0.1292 gr. gave 0.3100 $BaSO_4$.
S = 32.90 per cent.
- II. Gutta:—0.1023 gr. gave 0.2698 $BaSO_4$.
S = 36.21 per cent.
Balata:—0.1756 gr. gave 0.4526 $BaSO_4$.
S = 36.38 per cent.

These sulphur contents are of the order of those found by Weber (Gummi-Ztg., 1902, 16, 563) for the upper limit of caoutchouc vulcanisation, with respect to which the formula $C_{10}H_{16}S_2$ (S = 32.00 per cent.) is claimed. The higher figures of I., which are paralleled in Weber's experiments, point to substitutive action.

ACTION OF NITROGEN OXIDES.

The action of nitrogen oxides upon caoutchouc and gutta percha has been studied by Weber (Ber., 35, 1947) and by Harries (Ber., 35, 3256; see this J., 1902, 1404). In dealing with gutta and balata, nitrogen peroxide, prepared by acting on arsenic with nitric acid and mixing the gases with oxygen, was passed into benzene and the solution added to benzene solutions of the hydrocarbons. The first products of reaction were greenish gelatinous precipitates which dried to horny masses: they were not directly soluble in acetone, but passed into solution on standing; they were of variable composition, the nitrogen-contents fluctuating between 9 and 11 per cent. On adding more nitrogen peroxide, yellow clots separated, which soon became granular; they were filtered off and purified by dissolving in acetone and precipitating with ether. These substances are buff-coloured impalpable powders, soluble in acetone and ethyl acetate with tawny colour, also in caustic alkalis, but not in ammonia. They shrink about 90°, darken, and become pasty at 120°, and finally gases are slowly given off with charring. Concentrated H_2SO_4 dissolves them quietly.

- Gutta:—0.1815 gr. gave 0.3488 CO_2 and 0.1133 H_2O .
0.3218 gr. gave 33.5 c.c. N at 15° and 762 mm.
C = 52.44, H = 6.94, N = 12.42 per cent.

Balata:—0.1120 gr. gave 0.2144 CO_2 and 0.0706 H_2O .

0.3258 gr. gave 32.9 c.c. N at 15° and 768 mm.

C = 52.31, H = 7.00, N = 11.20 per cent.

required for $C_{10}H_{16}N_2O_4$:—C = 52.62, H = 7.02, N = 12.28 per cent.

On subjecting these bodies to the further protracted action of nitrogen peroxide, heat was evolved and bubbles of gas given off. The products, after reprecipitation by ether from acetone solution, were saffron-yellow powders soluble in acetone, ethyl acetate, alkalis, and ammonia with a deep orange colour. The yield upon gutta and balata was 218 and 216 per cent. respectively. These bodies intumescence at 160° and delagate, yielding a puffy residue of carbon. They are decomposed violently by concentrated H_2SO_4 .

Gutta:—0.1491 gr. gave 0.2169 CO_2 and 0.0675 H_2O .

0.2447 gr. gave 29.0 c.c. N at 9° and 770 mm.

C = 41.50, H = 5.03, N = 14.63 per cent.

Balata:—0.1452 gr. gave 0.2231 CO_2 and 0.2680 H_2O .

0.2988 gr. gave 36.8 c.c. N at 15° and 766 mm.

C = 41.89, H = 5.20, N = 14.76 per cent.

required for $C_{10}H_{16}N_2O_7$:—C = 41.52, H = 5.19, N = 14.53 per cent.

Thus they are evidently identical with Harries' "nitrosite c" of the above formula. The gas evolved in their formation was analysed and found to consist of nitrogen with 4 per cent. of carbon dioxide. It is certain that the formation of these bodies is a step in the degradation of the polyprene molecule, and their further decomposition may be expected to throw light in this direction. By the action of reducing agents more or less nitrogenous, amorphous substances are produced, and in many cases ammonia is formed. Nitric acid eventually yields oxalic acid, but an intermediate yellow amorphous body soluble in alcohol was isolated for which Harries' formula $C_{15}H_{21}N_4O_{11}$ was confirmed:—

0.2448 gr. gave 0.3518 CO_2 and 0.0993 H_2O .

0.2668 gr. gave 28.0 c.c. N at 19° and 758 mm.

C = 42.65, H = 4.90, N = 12.31 per cent.

required for $C_{15}H_{21}N_4O_4$:—C = 41.55, H = 4.85, N = 12.94 per cent.

The "nitrosite c" does not dissolve without decomposition in alkalis. The precipitated product, which, in other ways, resembled the original, contained only 12.42 per cent. of nitrogen. On boiling the alkaline solution, a brown powder insoluble in aqueous liquids separates out, which contains alkali; in the mother liquors formic acid, nitric acid, and a yellow nitrogenous body soluble in ether and striking deep yellow with alkalis, were found.

Unexpected results were obtained by acting on benzene solutions of polyrenes with pure, dry nitric oxide. Alcohol precipitated yellow elastic gums soluble in acetone and chloroform. They go into solution on boiling with caustic and are reprecipitated in sticky clots.

Caoutchouc:—0.1140 gr. gave 0.2750 CO_2 and 0.0844 H_2O .

0.2714 gr. gave 16.6 c.c. N at 21° and 761 mm.

C = 65.80, H = 8.23, N = 7.13 per cent.

Gutta:—0.1578 gr. gave 0.3736 CO_2 and 0.1174 H_2O .

0.3015 gr. gave 16.4 c.c. N at 22° and 761 mm.

C = 70.31, H = 8.74, N = 6.32 per cent.

required for $C_{10}H_{16}NO_2$:—C = 65.92, H = 8.79, N = 7.69 per cent.

Thus nitrogen and oxygen are not in the proportion in which they were supplied; probably the substances underwent oxidation in the course of purification.

It is noteworthy that all the nitrogenous derivatives here mentioned reduce Fehling's solution.

In conclusion, it is evident that the hydrocarbons of gutta percha and of balata are identical. As regards the comparison between gutta and caoutchouc, it has long been known that they behave similarly on destructive distillation and on nitration, and the above experiments indicate that there is no essential difference in the chemistry of these two forms of polyprene. It seems as if there were a common molecule, differences in the, perhaps polymeric, aggregation of which caused differences in mechanical structure. Any degradation of the molecule would lead to identical products, but in addition-products the dif-

ferentia of the parent hydrocarbons might be transferred. Thus vulcanised gutta is far from identical with vulcanised rubber mechanically, and even the marked divergence in the solubilities of the hydrochlorides might be due to this.

DISCUSSION.

Mr. WALTER F. REID said they were indebted to Dr. Caspari for the addition he had made to their knowledge of the reactions of those important raw materials. Some of the observations made were already known, especially with solvents, but many were new, and those which indicated the composition of these bodies were of great importance to chemical industry. If they could succeed in synthesising either gutta percha or india-rubber, it would have an important bearing on several industries. There were some points on which those connected with the trade would like to have more information, which, perhaps, they might hope the author would give them at a future time. Taking a piece of balata and a piece of gutta percha, to the ordinary untrained eye they simply appeared to be varieties of the same substance, but nevertheless there were very important differences. Gutta percha was the only substance known which could be used for submarine cables. If gutta percha was dissolved and precipitated, a product apparently purer than the natural product was obtained, but its insulating properties were so inferior that it could not be used for the same purpose. That was a point he would recommend to Dr. Caspari's attention in the hope that he might find out to what that difference was due. The necessity of having a material which was a good insulator was very great, and was increasing every year. The price of gutta percha was rising, and the supplies were diminishing, so that there was a very wide field for anyone who could find out the reason for this change in its properties. Again there were differences in connection with the action of the atmosphere on these bodies. Balata withstood the action of the air, but the best gutta percha when exposed to the air, even for a few months, especially if in the light, became very brittle, but he had seen balata machine belts which had run for 10 or 12 years and been almost as supple then as at the beginning. There was a remarkable similarity in composition between gutta percha and india-rubber which might to some extent be due to the conditions under which these gums originated. Looking at a map of the world, it would be seen they were both produced in bulk in regions which had a high average temperature, and a considerable amount of moisture. Some plants contained gutta percha which had never been utilised; for instance, he had found two in the forests of Brazil which contained a considerable percentage. If they could find that gutta percha of good insulating quality could be extracted or produced from a cheap material, such as balata, or some of these gums which were obtainable in considerable quantities in tropical and semi-tropical regions, they would render a signal service to the electrical and other industries. He was treating the matter more from the practical than from the scientific point of view, because he understood the author had not developed any constitutional formula, but he hoped in future he might be able to do so, and thus, perhaps, help them to a synthesis. There was only one case of a synthesis of india-rubber, and that was practically from one of its own decomposition products, when Tilden obtained india-rubber by the polymerisation of isoprene. He hoped in future they would also carry out some electrical experiments on these various decomposition products, as these would be of much value. The electric uses were most obvious at present, but others might be found in future.

Mr. J. SPILLER said in 1861 Dr. A. W. Hofmann published a paper on the oxidation of gutta percha, and the result at which he arrived was that the product contained 62.79 per cent. of carbon, 9.29 per cent. of hydrogen, and 27.92 per cent. of oxygen. The material obtained was from telegraph wires which had been coated and exposed in India. Four years later he (Mr. Spiller) carried out a similar investigation with india-rubber. He discovered a waterproof material in the market of

which he bought several yards for photographic purposes, and which was also used for packing cutlery. It was cotton wool matted together with india-rubber in benzene solution. This exposed to the air for about six years had been entirely converted into resin, an india-rubber resin, of which he made an analysis (Chem. Soc. Trans. 1865). The proportions of carbon, hydrogen and oxygen, whether derived from gutta percha or from india-rubber, were practically identical. Dr. Hofmann and himself were of opinion that they could not safely draw even an empirical formula for the resinous product from such a slender foundation, but that it was probably an additive compound derived from the native hydrocarbon by absorption of oxygen from the air, and then becoming soluble in alcohol, whereas the original was, of course, perfectly insoluble.

Prof. W. R. HODGKINSON said a good while ago he was at work on the action of bromine and chlorine on gutta percha dissolved in chloroform and carbon tetrachloride. The bromine solution in particular gave off an enormous amount of hydrobromic acid during the reaction. If he remembered rightly he obtained a substance which was not crystalline, but its composition corresponded very closely to the formula on the board. He thought it was $C_{15}H_5Br_5$, but they were very unsatisfactory compounds to work with.

Dr. J. LEWKOWITSCH asked what evidence there was that those compounds whose formula had been given were anything approaching to individuals. It was natural to connect these substances with the terpenes. Taking the ordinary oil of turpentine, addition products corresponding to a definite molecular formula could be obtained, but those cited by the author, the chlorine compounds, for example, looked very strange. The action of the chlorine was so energetic that an addition product could not be expected; it would be a product of decomposition. On employing bromine something more approaching a molecular compound was obtained. If a still milder reagent was used, as in the case of hydrochloric acid, an addition product was apparently obtained, although he would have expected 6HCl instead of 5HCl. Since the iodine compound had been mentioned he would like to know what formula was assigned to it, as it was more likely that with so mild a reagent, like the one used in the preparation of nitrosite, a definite addition compound might result. As regards the sulphur chloride compounds the action of the sulphur chloride was very energetic, and, of course, hydrochloric acid was evolved. No wonder, therefore, that the formulae of the compound looked hopeless. If the analyses given referred to one and the same product, or to two preparations, then it was evidently hopeless to base any conclusions on these results. The author had referred several times to Weber. Weber's papers were excellent to read, but, unfortunately, the whole experimental evidence had been doubted by everyone who had been over the ground. Since Dr. Caspari had brought them forward, as of more or less supplementary evidence, he should like to know how far that evidence went.

Mr. W. C. HANCOCK said that with regard to these chlorine and bromine compounds there was a paper, which probably the author was well acquainted with, by Gladstone and Hibbert, published in the *Journal of the Chemical Society* for 1888, in which they dealt with the chemical and also with the optical properties of these substances, chiefly in solutions of benzene. The formula obtained for the bromine compound by those authors was approximately $C_{10}H_{16}Br_4$. In the case of chlorine he had great difficulty in obtaining anything like a definite compound as there was a copious evolution of hydrochloric acid. He mentioned that with the solvent chloroform he had found practically no action with iodine on caoutchouc. It was interesting to notice that this paper confirmed the work of Greville Williams and others that caoutchouc and gutta percha were practically identical chemically, but very different in physical properties, also the results which Sir William Ramsay laid before them two years ago as to the great difficulty there was in dealing with these substances. Some interesting information with regard to gutta percha, which the author was doubtless

aware of, could be found in the Cantor lectures delivered before the Society of Arts in 1897 by Dr. Obach.

Dr. W. A. CASPARI, in reply, said with regard to the difference between gutta percha and balata, he could only say that, as far as the hydrocarbons were concerned, he found no chemical difference between them and scarcely any mechanical difference. But it must be remembered that gutta percha and balata as used for industrial purposes contained the full amount of resin with which they were associated in nature, and in that respect differed from good india-rubber, in which the resin amounted to a few per cent. at most. In both gutta percha and balata the percentage was extremely high. The good insulation of gutta percha was due really more to the resin than to anything else; the resins by themselves were magnificent insulators, but it was not possible to use extracted gutta percha resin to cover the wires for its lacked mechanical strength. It seemed to be the aim of the telegraph wire-maker to get just the right proportions of the hydrocarbons and resin in his covering material to give the best possible results. There were no doubt several kinds of trees which had not yet come into use which might give bodies resembling india-rubber if not in paying quantities, but he would point out that the conditions under which raw gutta percha and balata were imported into England varied notably. Balata was very little adulterated. It contained the resin with which it was associated in the tree (whether that was an oxidised product of the hydrocarbon or not it would be interesting to know, but he was not at present prepared to say). On the other hand, gutta percha, which came from Eastern Asia, mostly passed through the hands of Chinamen, and was grossly adulterated. Every one of the specimens he had worked with was adulterated. Not only were various qualities of gutta percha mixed up beyond recognition, but a lot of entirely foreign resins had been added and mixed up with the bulk. If there had been any obvious commercial application of those derivatives which he had obtained he should have mentioned it. It seemed to him that all the halogen and nitrogenated compounds were little likely to be of use on the lines on which gutta percha itself was used. The vulcanising seemed to offer greater possibilities. The ebonites obtained did not seem to differ from india-rubber ebonite. If it were possible to get bubble-free ebonite (which he could not do, as he had no machinery for the purpose), he did not see why vulcanised balata should not do as well as india-rubber and be possibly cheaper. But the vulcanised products, with a few per cent. of sulphur only, were of very little use, he thought. Dr. Hodgkinson's experiences of the difficulties of working with these polyene derivatives confirmed his own, and that led up to the point whether most of these bodies were chemical individuals. He did not believe they were, and if Dr. Lewkowitsch had had to do with them he would have come to the same conclusion. The most he could do was to get the maximum amount of halogen added to the hydrocarbon and see what came out. The data hitherto obtainable were not in good agreement. Some of Weber's results, as had been mentioned, differed widely from these, and he had a certain diffidence about speaking of Weber at all. Weber's iodide contained an enormous quantity—70 per cent.—of iodine, whereas other observers had not been able to add iodine to caoutchouc.

Prof. HODGKINSON said he had the same experience.

Dr. CASPARI said there was no doubt it went in, and a substance was obtained *toto coco* different from the original hydrocarbon. He should like to point out that in external characteristics the iodides he obtained were very much what Weber described his to be, but he could only get from 12 to 13 per cent. of iodine into them. The situation, therefore, was this: they must have some considerable body of evidence as to the practical effects of chemical action on these hydrocarbons before they could begin to talk about either chemical individuals or molecular structure, and it would be well to get one or two authorities to agree one with the other before going further. As regards the nitrogenated bodies there was more hope. No doubt the first body mentioned was an

individual, and other workers before him had made it clear that the second was an individual; unfortunately, they were not crystalline—nothing connected with gutta percha was. In the formation of the second body, the polyene molecule had been broken into; if they could further break that down and obtain a definite known substance, there might be some hopes of getting a glimpse of the constitution of these hydrocarbons.

THE DETERMINATION OF ZINC IN LIGHT ZINC-ALUMINIUM ALLOYS.

BY RICHARD SELIGMAN, PH.D., AND F. J. WILLOTT.

A rapid method of estimating zinc in zinc-aluminium alloys is rendered particularly desirable by the increasing number of uses to which such compounds are now put. For this purpose, we have not found any of the customary modes of procedure well suited.

The alloys most generally met with contain up to 20 per cent. of zinc and 80 per cent. of aluminium with varying proportions of copper. Minute traces of silicon iron and lead are usually present as impurities of the aluminium and zinc; more rarely small quantities of nickel and tin are found.

In such cases, it is impossible to carry out a volumetric determination of the zinc by precipitating the aluminium from acid solutions with ammonia owing to the bulk of the precipitate thus formed and the stubbornness with which the latter retains zinc.⁽¹⁾

On the other hand, separation by means of sulphuretted hydrogen with a view to gravimetric determination of the zinc is rendered tedious and lengthy, by the difficulty of washing the zinc sulphide precipitate free from aluminium salts. The subsequent conversion of zinc sulphide to a weighable form also consumes much time.

By combining these methods, and by taking advantage of the solubility of the alloys in question in caustic soda,⁽²⁾ we find it possible to complete a zinc determination in little more than an hour, whilst a comparison of the two columns annexed shows that the accuracy of this method is all that is desired for technical purposes.

These results are taken at random from many such determinations, and none have been arbitrarily suppressed.

Volumetric. Zinc per cent.	Gravimetric. Zinc per cent.
42.80	43.08
19.00	18.88
18.10	17.93
13.87	13.90
12.50	12.41
11.68	11.88
8.70	8.72
1.99	1.89

Our mode of procedure, of which details are given below, consists in dissolving the sample in caustic soda, precipitating the zinc from this solution as sulphide, redissolving the precipitate in hydrochloric acid, and titrating the zinc with potassium-ferrocyanide solution. For the titration we have chosen this latter method,⁽³⁾ as we are convinced that it is in every way preferable to that of using sodium sulphide solution.

In a 400 c.c. beaker, covered with a clock glass, half a gram of the drillings to be analysed is dissolved in 25 c.c. of a 25 per cent. caustic soda solution. The contents of the beaker are warmed until rapid evolution of gas takes place, and are then allowed to stand until solution is complete. This occurs in from five to ten minutes according to the coarseness of the drillings or turnings used.

The solution is then diluted to 300 c.c. with boiling water, and any undissolved iron, copper, lead, tin or nickel allowed to settle. The clear liquid, which contains almost all the zinc and aluminium, is removed by decantation, and the residue washed twice by the same means. It is found that a small quantity of zinc is usually contained in this residue, although we have not determined

in what form it is present. This is removed by dissolving the residue in a few drops of concentrated hydrochloric acid, and diluting to 20 c.c.; having neutralised with caustic soda, 2 c.c. of the latter are added in excess. After warming, the precipitated hydrates are removed by filtration and washed, filtrate and washings being added to the main bulk of the zinc and aluminium solution.

From the solution of sodium aluminate and sodium zincate the zinc is now precipitated by sulphuretted hydrogen, the stream of gas being checked when it is seen that alumina is being precipitated with the zinc sulphide. This moment may be easily recognised by the formation of a skin at the point where the bubbles of gas burst. Contrary to the case of a gravimetric determination, the presence of a small amount of alumina in the zinc precipitate is quite innocuous, up to 10 per cent. of the former not interfering with the accuracy of the ferrocyanide determination.⁽⁴⁾ The zinc sulphide precipitate, which is usually flesh coloured owing to the presence of a negligible trace of iron, is now allowed to settle for about five minutes, the clear liquid decanted, and the precipitate finally thrown upon a filter. For the same reason as above, it is entirely unnecessary to wash the precipitate free from aluminium salts, and thus the greatest difficulty in handling zinc sulphide is avoided. The precipitate is now dissolved from the filter with 8 c.c. of hydrochloric acid, and the paper carefully washed, the washings being collected in the beaker used for precipitation. After dilution to 250 c.c. with boiling water 5 grms. of ammonium chloride are added, and the amount of zinc is at once ⁽⁵⁾ determined by titration with a standard solution containing 22 grms. of potassium ferrocyanide to the litre. Uranium nitrate, uranium acetate, or ammonium molybdate⁽⁶⁾ is used as indicator.

This method of titration is now so well known, and its advantages so well recognised⁽⁷⁾ that we do not propose to discuss it here. We will only mention the following points, which have appeared to us advantageous:—

Instead of a porcelain plate, we use a slab of paraffin wax for carrying out the spot tests. Though we have not heard of the use of this device in Europe, it is frequently adopted in the United States. Owing to the form the drops take on such a surface, the ease with which it can be cleaned and the large number of tests which may be made in a small space, we consider a paraffin wax plate, or better still a porcelain plate covered with a thin coat of wax, most useful.

The presence of minute traces of iron in the zinc solution to be titrated is beneficial. The solution assumes a faint blue colour, which disappears shortly before the main reaction is complete.

DISCUSSION.

Mr. GRANT HOOPER said, with reference to Dr. Seligman's remarks as to the character of the zinc sulphide precipitate in alkaline solution, he would suggest precipitation in acetic acid. He could quite understand, however, that the author had no real difficulty in this case, inasmuch as the presence of a small proportion of alumina made no difference in his determination, and he thought, with the results before them, the method which he had brought forward was very suitable for the purpose in view. If he needed to go further, and it was a question of a gravimetric determination of the zinc, he would suggest its precipitation and weighing as phosphate, which was a most convenient and ready method.

Mr. THOMAS TYRER said he could confirm what Mr. Grant Hooper had said with regard to phosphate.

Dr. SELIGMAN, in reply, said that, in some respects, the precipitation from an acetic acid solution was

better, but this would mean an extra operation, and for works purposes that was a disadvantage; owing to not having to wash the precipitate the present operation took practically no time. The chief difficulty with zinc sulphide was always in washing. The same remark applied to the phosphate. They knew that was an excellent form in which to precipitate zinc, but it was not desirable for their purposes.

THE ESTIMATION OF NAPHTHALENE IN COAL GAS.

BY C. J. DICKENSON GAIR.

At first sight the estimation of naphthalene, either in pure or impure coal gas, does not appear to be beset with any great difficulty. The well-known fact that the vapour of naphthalene precipitates naphthalene picrate, when passed into a strong solution of picric acid, is apparently all that is necessary on which to base a method of estimation, but it is found to be impossible to estimate naphthalene in coal gas by merely passing a measured quantity of the gas through a picric acid solution and then weighing the ppt. so formed as naphthalene picrate; because, in the first place all the hydrocarbon will not combine with the picric acid, but some of it condenses out in the free state. Secondly, a quantity of naphthalene invariably condenses in the delivery pipe and connections of the apparatus, and thirdly, with coal gas containing quantities of ammonia the picric acid is neutralised to some extent, ammonium picrate being formed, which destroys any degree of accuracy.

The first method of estimation to be noticed was devised by Colman and Smith (this J., 1900, 128). It is unnecessary to go into elaborate details of such a well-known test, the following being a short sketch of a slight modification of the original, which has been found very simple and rapid of execution. The gas to be tested is passed through three Woulff's bottles containing exactly 500 c.c. of N/20 picric acid solution and then through an experimental meter. After a known number of cubic feet of gas have been passed, the test is shut off and the contents of the Woulff's bottles mixed together in a 20 oz. flask, and carefully heated on a water-bath to a temperature of about 60° C. until the precipitate of naphthalene and naphthalene picrate has entirely dissolved. Naphthalene picrate is easily decomposed by excessive heat, and to guard against loss from this cause, the flask is always fitted with a cork through which a glass tube dips into a beaker containing a small quantity of picric acid, from the Woulff's bottles. After the experiment, the picric acid in the beaker is poured back into the flask, the contents of which are then cooled. Crystalline masses of naphthalene picrate separate out, and when quite cold the precipitate is filtered off, dried *in vacuo* or in a warm room, and weighed. From the weight of naphthalene picrate thus found, the amount of naphthalene per 100 cu. ft. of gas can easily be calculated. A volumetric method of estimation is also in vogue and this may be carried out as follows:—An aliquot portion of the clear residual picric acid solution is taken. Laemoid indicator added, and the whole titrated with N/10 sodium hydroxide solution. The difference between the result thus found and the quantity of picric acid in the original solution, represents the amount of picric acid which has combined with the naphthalene; and as 22.9 parts of the former combine with 128 parts of the latter, the amount of naphthalene in the gas is easily calculated. To guard against loss of naphthalene by condensation in the pipe leading to the apparatus, it is well to have a connection as near the main as possible, and to surround it by a steam jacket. The author has found this to be an immense advantage in all methods of estimation. Colman and Smith's test is really devised for pure or nearly pure coal gas, but it can be made to give gravimetric results with

cool impure coal gas, if the ammonia be removed. This is effected by means of oxalic acid solution, maintained at a temperature of about 80° C. All that is necessary is to introduce a Woulff's bottle containing the hot liquid in front of the bottles containing picric acid solution.

The next method to be noticed is one devised by Somerville. Three glass tubes about 7 in. long and 1 in. wide are fitted up in a similar manner to Woulff's bottles, and about 35 c.c. of 70 per cent. alcohol are poured into each, the three are closely connected a measured quantity of gas passed through and the test disconnected. The contents of the tubes are then intimately mixed in a flask. If the gas used is impure, it will be necessary to add concentrated oxalic acid solution, until the ammonia is entirely neutralised, as shown by litmus paper. The contents of the flask are now filtered and the filter paper thoroughly washed with dilute alcohol. Concentrated picric acid is added in large excess, about 500 c.c. are generally necessary, the liquid agitated and allowed to stand for about half an hour. By that time all the naphthalene picrate will have separated out, and may be filtered, dried slowly, and weighed. The advantage of this method and the following one is that the naphthalene picrate is readily obtained without the risk of loss of weight. The liquid filters somewhat slowly in Somerville's method, and, owing to the finely divided state of part of the precipitate, it is often necessary to pour back the first part of the filtrate several times, until it becomes quite clear.

There is one other method for the gravimetric estimation of naphthalene in coal gas which may be cited here. This test, devised by the author, is founded on the action of a suitable solvent. The solvents for naphthalene which are applicable for its estimation are few and far between, and in this case use is made of acetic acid of a sp. gr. of about 1.044. About 350 c.c. are taken in two Woulff's bottles or towers. A small Woulff's bottle containing 150 c.c. of picric acid solution is also added after the acetic acid to act as a catch, and a measured volume of gas, not more than 3 to 6 cb. ft. usually, passed through at the rate of about 1 cb. ft. per hour. If the gas is impure, use is made of the hot oxalic acid solution as mentioned previously. In the event of there not being sufficient pressure to force the gas through the wash bottles, or if the gas be under vacuum itself, use is made of a piece of apparatus which pulls the gas through the bottles by means of a water pump, and then automatically separates it from the water, the gas passing through the experimental meter at ordinary atmospheric pressure. After the experiment is finished, the acetic acid and picric acid from the bottles are mixed in a flask, and about 500 c.c. of concentrated picric acid solution added. Pure naphthalene picrate separates out at once, in large flocculent masses, which have the advantage of being extremely easy to filter. After filtering, the naphthalene picrate is dried *in vacuo* or a warm room, and weighed. The method was proved to be correct in the following manner. A small corked bottle or U-tube was taken, having inlet and outlet tubes, a quantity of pure dry naphthalene crystals inserted in the bottle and the whole weighed. The bottle was then connected up to a supply of coal gas from which every trace of naphthalene had been removed. The Woulff's bottles containing acetic acid were connected, the experiment started and allowed to proceed for some time. The gas was then shut off, the bottle stoppered and placed in a desiccator for a few minutes and again weighed, the difference in the two weighings being the quantity of naphthalene passed into the bottles. The same process of precipitation, &c., was gone through as previously described, care being taken that any naphthalene crystals that might have been condensed in the colder parts of the apparatus, were first dissolved in a small quantity of alcohol and then added to the acetic acid. The quantity of naphthalene found by calculation was then compared with the quantity found by actual weighing. The results of experiments were as follows:—

Weight of naphthalene passed in grains.	Weight of naphthalene found by experiment in grains.
0.500	0.470
0.800	0.778

And using air as naphthalene conveying agent:

Weight of naphthalene passed in grains.	Weight of naphthalene found by experiment in grains.
0.500	0.491
0.550	0.537
0.400	0.394
0.400	0.394

showing that the method is sufficiently accurate for all technical purposes, the average error being about 1.8 per cent. As regards coal gas, numerous comparative experiments were made with Colman and Smith's method, and a few of the results are here appended:—

Acetic acid method. Grains of naphthalene per 100 cb. ft. of gas.	Colman & Smith's method. Grains of naphthalene per 100 cb. ft. of gas.
Pure { 39.4	38.4
Gas { 30.1	29.5
31.3	32.0
38.4	38.2
Impure { 33.1	36.7
Gas { 35.8	35.8
55.6	48.4

It is almost unnecessary to state, that in no experiment was any length of rubber tubing left exposed to the gas, because of its power to absorb large quantities of naphthalene.

It should be mentioned, in conclusion, that the reason for adding such large excesses of picric acid in the alcohol and acetic acid tests is because naphthalene picrate itself is quite soluble in both alcohol and acetic acid.

DISCUSSION.

Dr. H. G. COIMAN said the author had shown how, by the use of acetic acid, he could obviate the chief difficulty which he and Mr. Smith experienced in the test they devised. They found that when gas was passed through an aqueous solution of picric acid, the whole of the naphthalene was removed from the gas and it came down partly in combination with picric acid as picrate, and partly as free naphthalene. What they were afraid of, at first, was that the other vapours in the gas, like xylene, would also come down, but as a matter of fact they did not do so in an aqueous solution. The picrates of these hydrocarbons were then dissociated entirely, whereas, in the case of naphthalene, dissociation was only partial. To get over this difficulty and to obtain the naphthalene in a form in which it could be weighed, Küster's method was adopted, namely, heating the liquid containing the naphthalene and picric acid on a water-bath until they were dissolved. Then, on cooling, the naphthalene separated out as picrate. The author had shown that in the presence of dilute acetic acid the naphthalene came down at once as picrate, and in that way he obviated the necessity of heating, which was perhaps more objectionable from the length of time it required than for any other reason, although it introduced another possible source of error. By his method, Mr. Dickinson Gair obtained the naphthalene picrate direct in a form which could be weighed. It seemed to him rather a disadvantage to have a gravimetric method as the only option. He preferred a volumetric method if one sufficiently accurate could be obtained, particularly when tests had to be made in different parts of the country and in small works where perhaps a balance did not exist. It was easy to take a sufficient amount of standard solution to work the test. There appeared to him a possibility that by combining the new method with the one devised by Mr. Smith himself, a volumetric process could be devised in which the heating process was avoided. As naphthalene picrate was formed without dissociation in dilute acetic acid solution it seemed possible that by adding some acetic acid to the standard picric acid solution the naphthalene would come down directly as picrate, instead of as a mixture of free naphthalene and naphthalene picrate. He had made a few experiments, and although it was too soon to say that the method would work, the results, as far as they went, indicated that there was a reasonable

possibility of success. With regard to the use of alcohol, he had tried some experiments, at the suggestion of Mr. Somerville, and found that, unfortunately, in this case a certain amount of xylene and other hydrocarbons did form picrates, and were precipitated along with the naphthalene so that the results of the test came out too high. The picrates produced looked just the same as the naphthalene picrates, but whereas naphthalene picrate melted at about 149°, when using alcohol he got a mixture with a m. pt. about 90°. On heating with caustic soda, instead of solid naphthalene, a mixture of naphthalene and other hydrocarbons was produced.

Mr. J. HEWETT said he had tried a similar method recently. The acid he generally used was of a strength of about 70 per cent. He had also tried the alcohol method mentioned by Dr. Colman, and found that the cloudy precipitate (being, he took it, the xylenes) was not present in such quantity as in the acetic acid method. If any came down it cleared in a much shorter time, and the solution could be filtered quicker. He had made experiments using dilute acetic acid for the estimation of naphthalene in coal gas, and he had also tried it for extracting naphthalene from turpentine, petroleum, paraffin, oils, and so forth. If naphthalene was dissolved in turpentine or other oils, and acetic acid added, a homogeneous solution resulted, from which crystals of naphthalene picrate separated on addition of picric acid. In most cases the oil did not separate except on the surface. The results, he believed, were fairly accurate.

Mr. BUTTERFIELD said he had had considerable experience with various modifications of Küster's method, as elaborated by Colman and Smith. Working on gas at ordinary temperatures, that method left little to be desired; but with crude coal gas at a temperature of, say, 80° F., the maintenance of the temperature of the connections with a steam coil and of the solution for the absorption of ammonia for several hours, as referred to by the author, were matters of some difficulty on gas works, and in that respect he thought the picric acid methods as a whole failed. He could not speak as to the method of Mr. Somerville with alcohol, but it seemed more promising. When estimating naphthalene in coal gas at a temperature over 100° F., he thought some method of absorption by an oil which was not a coal tar product, and subsequent recovery of the naphthalene by fractional distillation of the oil, would be likely to give more satisfactory results than the picric acid method.

Dr. COLMAN said the picric acid method was only applicable to gases at ordinary temperatures; at high temperatures it did not work at all.

Mr. DICKENSON GAIR, in reply, said the question raised by Dr. Colman in reference to the gravimetric and volumetric methods of analysis was only a matter of taste; when there was any difficulty in obtaining a balance it was a very simple matter to collect the samples, bring them home, and test them in the ordinary manner. He could confirm the statement that alcohol took out toluene and xylene. Xylene picrate was undoubtedly precipitated to some extent. In his experience it made the results higher by about 5 grs. per 100 ft. The acetic acid method was applicable to hot coal gas, because the warmer the acetic acid became the greater power it had of dissolving naphthalene, and if a sufficient number of absorption bottles were used, a gradual cooling down of the gas took place, and the last bottle would contain no naphthalene. As for the fractionating method Mr. Butterfield had suggested he did not think it had any advantage, inasmuch as it was just as likely to become blocked up during the four or five hours working as was the acetic acid test. He believed a method was introduced by a German chemist some years ago for estimating naphthalene in coal gas by passing it through benzene and then fractionating the benzene.

SALTS OF THE ALKALOID CINCHONAMINE.

BY BERNARD F. HOWARD, A.L.C., AND F. PERRY.

Introductory.—The most recent research work published on the alkaloid cinchonamine is a paper by Arnaud, in the *Annales de Chimie et de Physique*, in 1896. In this paper Arnaud sums up all the work done previously by Hesse, and compares his own results with those obtained by the latter. The object of the present research was to prepare and investigate the customary salts and derivatives of the alkaloid with a view to throwing some light upon its constitution. This first paper is devoted mainly to investigations on the salts of cinchonamine.

The crude cinchonamine was in the form of a very impure nitrate, and had been precipitated as such from the alkaloids obtained from the bark of *Remijia Purdieana*. The chief impurity in this crude precipitated nitrate was the amorphous alkaloid paricine, and this was eliminated by dissolving, filtering and crystallising twice as nitrate from water (the cinchonamine being obtained as the crystallised nitrate and the paricine remaining in the mother liquor), precipitating the alkaloid, redissolving in hydrochloric acid and recrystallising three or four times as hydrochloride. The purified hydrochloride was then precipitated, giving a perfectly white alkaloid, and this was crystallised from acetone, when a clean colourless, crystalline product was obtained.

Cinchonamine Hydrochloride, $C_{19}H_{24}N_2O \cdot HCl$, was obtained by dissolving the pure alkaloid in a considerable excess of dilute hydrochloric acid, and crystallising from the acid solution. The salt crystallised in soft laminae, almost white, and of a glistening appearance. The chlorine was estimated in the usual manner by precipitation with silver nitrate. Owing to the slight solubility of cinchonamine nitrate, it was necessary to make the solution very dilute and hot before acidifying with nitric acid, otherwise the nitrate was partially precipitated.

Percentage of chlorine obtained (1) 10.55, (2) 10.48, mean, 10.51 per cent.; Arnaud, 10.44 per cent.; Hesse, 10.21 per cent.; calculated for $C_{19}H_{24}N_2O \cdot HCl$, 10.67 per cent.

Arnaud describes a hydrated hydrochloride containing 1 mol. of water prepared by recrystallising the ordinary hydrochloride from a neutral solution. The percentage of water in the sample he prepared was 5.30 per cent. as against 5.10 per cent. calculated for the above formula.

Repeated experiments were made with neutral solutions and the salt obtained after carefully drying contained from 0.39 per cent. to 4.75 per cent. of water. The appearance of the crystals also varied considerably, those containing the least water being similar to the ordinary hydrochloride in appearance, whilst the most hydrated crystals were solid, transparent, and cube-shaped. This corroborated Arnaud's statement that the hydrated hydrochloride was "essentially different from the crystals of the original hydrochloride."

The extraordinary variations obtained above from solutions exactly similar in neutrality, led the authors to investigate whether Arnaud's statement was correct, that the hydration of the product was merely a question of the neutrality of the solution from which it was crystallised.

For this purpose the salt obtained above which most nearly attained to the theoretical 5.10 per cent. of water was utilised to obtain a curve of solubility. This was plotted with the ordinary hydrochloride curve, and it was observed that the curves crossed at 27° C.

This gave rise to the possibility of the hydration of the product being solely due to the temperature of crystallisation. Accordingly, a hot saturated neutral solution of the hydrochloride was cooled down to 27° C. and rapidly filter-pumped. The filtrate was placed in a refrigerator for several hours, and allowed to deposit a further crop of crystals. This was filtered and dried as far as possible with the vacuum pump, then with drying paper, and the percentage of water determined. The same process was repeated with another hot, saturated solution to obtain confirmatory results. The percentage lost on drying at 100° C. in two experiments was 5.26 per cent. and 4.94 per cent., giving a mean of 5.10 per cent., which is the theoretical percentage of water for the mono-

hydrated salt. This result is very strong evidence in favour of the hydration of the hydrochloride being merely a question of temperature of saturation, and to confirm this, in each of the two experiments described above, the hydrated crystals were of the solid, cubical type previously mentioned, and quite different from the ordinary anhydrous crystals.

In order to ascertain whether a dihydrochloride could be formed, a strong aqueous solution of the ordinary hydrochloride was treated with sufficient hydrochloric acid to form a compound of the formula $C_{19}H_{24}N_2O \cdot 2HCl$, and allowed to crystallise. The crystals (which exactly resembled the ordinary hydrochloride in crystalline structure), were dried at $100^\circ C.$, and the chlorine estimated. The percentage found was 10.53 per cent., which was fairly close to the calculated percentage of chlorine in the ordinary hydrochloride, *viz.*, 10.67 per cent. This product was, therefore, considered to be the ordinary hydrochloride, and it was consequently concluded that in this case the alkaloid will not form a dihydrochloride, and only acts as a monovalent base.

The *Hydrombromide* was prepared in a manner exactly similar to the hydrochloride. The alkaloid was dissolved in a considerable excess of 10 per cent. hydrombromic acid, and crystallised. The product was dried between drying paper at the ordinary temperature, and the amount of water lost at $100^\circ C.$, was 0.13 per cent. From this it was concluded that the hydrombromide was an anhydrous salt.

The bromine was estimated after drying at $100^\circ C.$ Percentage of bromine found (1), 20.89, (2) 21.09; mean, 20.99 per cent.; Arnaud, mean, 20.97 per cent.; Hesse, mean, 20.89 per cent.; calculated for $C_{19}H_{24}N_2O \cdot HBr$, 21.22 per cent.

It was next ascertained whether a hydrated hydrombromide could be obtained by recrystallising from an absolutely neutral solution below $27^\circ C.$, as was done in the case of the hydrochloride. Owing to the very slight solubility of the hydrombromide in cold water, a large quantity of solution had to be used to obtain sufficient crystals below $27^\circ C.$ The crystals obtained were dried between filter papers and tested for hydration. There was no change in weight on heating at $100^\circ C.$, whence it was concluded that the alkaloid does not form a hydrated hydrombromide corresponding to the hydrated hydrochloride.

An unsuccessful attempt was made to form a dihydrombromide by treating a solution of the hydrombromide with sufficient hydrombromic acid. The percentage of bromine in the product was 21.05 per cent., which corresponded fairly closely to the calculated percentage for the ordinary hydrombromide, *viz.*, 21.22, and showed that, as in the case of the hydrochloride, the alkaloid will only act as a monovalent radicle.

Cinchonamine Hydriodide.—Arnaud describes the preparation of this salt by the double decomposition of a salt of cinchonamine with potassium iodide. It can also be prepared by boiling the alkaloid with a dilute solution of hydriodic acid (about 5 per cent) for some hours with a reflux condenser. Prepared by either method, it crystallises in shining, plate-shaped laminae, slightly yellow, very like the hydrochloride in crystalline structure.

Analysis of the Hydriodide.—Percentage of iodine obtained:—(1) 27.7, (2) 27.2; mean, 27.45 per cent.; Arnaud, mean, 29.63 per cent.; Hesse, mean, 29.55 per cent.; calculated for $C_{19}H_{24}N_2O \cdot HI$, 29.95 per cent.

In preparing the hydriodide from the alkaloid and hydriodic acid, care must be taken to use sufficiently dilute acid. If 50 per cent. acid is used decomposition takes place and the product is a brown, amorphous salt, which gives a lower percentage of iodine on analysis than that prepared from dilute acid, *viz.*, 26.08 per cent., as against 28.87 per cent. This latter product was only slightly yellow, and in other respects closely resembled the hydriodide prepared from potassium iodide.

The salt used for these estimations had been dried at $100^\circ C.$, at which temperature evidently some hydriodic acid had been lost owing to slight decomposition. In order to verify this a current of dry air was passed over a weighed quantity of the salt, and then through a solution of silver nitrate. After a few minutes

the silver nitrate became turbid, showing that hydriodic acid was being given off from the salt. The current of air was continued for eight hours, and then the silver iodide formed was weighed. The weight of cinchonamine hydriodide over which the dry air was passed was 0.1406 gm.: 0.0167 gm. of silver iodide was collected, equivalent to 0.00945 gm. of hydriodic acid; hence the percentage of hydriodic acid collected was 6.5 per cent.

If on exposure to dry air the cinchonamine iodide lost 6.5 per cent. of hydriodic acid, it was only natural that after drying at $100^\circ C.$ low results were obtained in the iodine estimations. It is evidently very difficult to obtain the salt quite dry without partial decomposition taking place.

Solubility of Cinchonamine Iodide.—Arnaud states that this salt is almost insoluble in cold water. He does not state, however, that it is very fairly soluble at higher temperatures. At $100^\circ C.$ 1 part of cinchonamine iodide dissolves in 90 parts of water, and it will be observed that the difference in solubility of the three halogen salts at high temperatures is not so very large. At ordinary temperatures, however, there is a great difference in the solubility, the iodide being very much less soluble than the other salts.

Cinchonamine Platinochloride.—This was prepared by adding a slight excess of platinic chloride to a solution of cinchonamine hydrochloride. It formed a very insoluble, semi-crystalline, yellow precipitate. This was dried and the platinum estimated: 0.4722 gm. gave on ignition 0.0928 gm. of platinum. Percentage of platinum obtained, 19.65 per cent.; Arnaud, mean result, 19.55 per cent.; Hesse, mean, 19.52 per cent.; calculated for $(C_{19}H_{24}N_2O)_2H_2PtCl_6$, 19.46 per cent.

Cinchonamine Salicylate.—This was formed by neutralising a warm solution of salicylic acid with cinchonamine alkaloid. A resinous mass was obtained on cooling, which, on dissolving in warm water and cooling, crystallised in short, thick, colourless prisms. These crystals were very readily soluble in acetone, from which they crystallised freely. In order to obtain the salt by crystallisation from water, it is necessary to have the solution very dilute, and the temperature must not be carried above about $70^\circ C.$, as, in that event, a resinous mass is again deposited. The white crystals obtained above melted in warm water but were only slightly soluble. The salt was not very easily dissolved by dilute mineral acids, decomposition only taking place on prolonged warming.

A weighed portion of the salicylate was dissolved in dilute sulphuric acid, and placed in a separator with ether. The alkaloid was then precipitated with an excess of sodium hydroxide and extracted with the ether. The ether was evaporated off and the alkaloid weighed. 0.1491 gm. of alkaloid was obtained from 0.2224 gm. of the salicylate, *i.e.*, 67.04 per cent; calculated for $C_{19}H_{24}N_2O \cdot C_6H_4(OH)COOH$, 68.29 per cent.

Cinchonamine Sulphate.—This salt is most easily prepared by neutralising a solution of cinchonamine alkaloid in absolute alcohol with dilute sulphuric acid. This operation should be carried out at a temperature just below the boiling point of alcohol; the neutral solution is just acidified and removed quickly from the water-bath, and the cinchonamine sulphate crystallises out on cooling, in small needles. The formation of the salt takes place most readily if the alcoholic solution of the alkaloid is about half saturated. The product is filtered, washed with alcohol, and may be safely dried at $100^\circ C.$ without any decomposition.

A weighed portion of the sulphate was dissolved in water, and hydrochloric acid and barium chloride solution was added. 0.4305 gm. of barium sulphate was obtained from 1.3649 grms. of the sulphate. Percentage of SO_3 obtained, 10.81 per cent.; Arnaud, 11.15 per cent.; calculated for $(C_{19}H_{24}N_2O)_2H_2SO_4$, 11.59 per cent. As this low result was again obtained on repeating the estimation, it was thought possible that the low percentage of SO_3 might be due to the presence of water of crystallisation, or alcohol of crystallisation in the sulphate obtained above. For instance, if the formula $(C_{19}H_{24}N_2O)_2H_2SO_4 \cdot 3H_2O$ represented the product obtained, the percentage of SO_3 would be 10.83.

Accordingly, to ascertain if this were the case, a weighed quantity was dried for a long period at 100° C. 1.3930 grms. under these circumstances lost 0.0023 grm., being a loss of only 0.164 per cent. This was considered sufficient evidence to show that the salt contained no water of crystallisation. The low result was, therefore, as in the case of the halogen salts, attributed to a slight tendency of the salt to decomposition while drying.

The sulphate is extremely soluble in water, and when dissolved cannot be recrystallised. The solution on evaporation only yields a gummy residue. It can, however, be crystallised out of a mixture of alcohol and water. If some of the sulphate is dissolved in hot water and then about four times its own volume of hot alcohol added, the salt will crystallise again on cooling in perfectly transparent prismatic crystals.

It is practically insoluble in absolute alcohol. It is very soluble in pyridine from which it crystallises in masses of crystals containing 1 mol. of pyridine. The sulphate in this pyridine cinchonamine sulphate was estimated in the usual way.

Weight of salt used = 0.5130 grm.; weight of BaSO₄ obtained = 0.1520 grm.; SO₃ obtained, 10.46 per cent.; calculated for (C₁₉H₂₄N₂O)₂H₂SO₄C₅H₇N, 10.39 per cent. This would point to the molecule containing 1 mol. of pyridine on crystallisation. The crystals obtained above had been washed quite free from free pyridine with alcohol, and the presence of pyridine in combination was further demonstrated by obtaining dibromopyridine as follows:—

A solution of the salt was treated with hydrochloric acid and barium chloride, with formation of cinchonamine hydrochloride, pyridine hydrochloride and barium sulphate. The barium sulphate was filtered out and the filtrate contained was treated with ammonia and the bases freed. The cinchonamine being insoluble was filtered out and the solution containing pyridine treated with 2 mols. of bromine. The dibromopyridine thus formed crystallised out freely, proving presence of pyridine in combination.

The fact that cinchonamine sulphate is quite insoluble in benzene prevents the possibility of there being a benzene sulphate similar to the pyridine sulphate.

The Bisulphate is best prepared by dissolving the sulphate completely in a small quantity of water (not exceeding 1 c.c. for each grm. of sulphate) at the temperature of the boiling water-bath, and stirring in a molecular quantity of dilute sulphuric acid, sufficient to convert (C₁₉H₂₄N₂O)₂H₂SO₄ into (C₁₉H₂₄N₂O)₂2H₂SO₄, approximately 923 parts by volume of dilute acid, to 1000 parts by weight of cinchonamine sulphate. The solution was cooled and masses of somewhat shapeless crystals were obtained on standing. On removing these and placing the mother liquor in a vacuum, large crystals slowly formed which were well defined octahedra, of a somewhat peculiar shape. At first sight they appeared to be cubical, but on closer examination it was found that two adjacent corners were missing in most cases, but in some crystals two diagonally opposite corners were cut off.

1.3617 grm. gave 0.7927 grm. BaSO₄; percentage of SO₃ obtained, 20.26 per cent.; Hesse, 20.65 per cent. calculated for C₁₉H₂₄N₂O₂H₂SO₄, 20.30 per cent; this author describes the bisulphate, which he obtained, in a similar manner, as hard and anhydrous prisms, and as he does not mention any octahedral formation, his product was probably identical with the first crystallisation obtained above.

Cinchonamine Picrate.—On adding a cold aqueous solution of picric acid to a cold aqueous solution of cinchonamine hydrochloride a yellow decolent precipitate separates out. The completion of the precipitation is very definite (as in the case of silver chloride). When filtered a yellow amorphous powder (cinchonamine picrate) is obtained. The temperature must not be allowed to rise above 50° C., or the picrate will melt. The salt thus obtained was dried between filter papers and in a desiccator fitted with a vacuum pump until no further loss of weight occurred. On heating this dried product gently, water was evolved, showing that the salt contained water in the molecule. This water was estimated by heating a weighed quantity to 100° C., until no further loss of weight occurred. 0.2617 grm. of cinchonamine picrate lost 0.0046 grm., or 1.80 per cent. H₂O.

This amount of loss corresponds to half a molecule of water in the composition of the salt—

C₁₉H₂₄N₂O₂C₆H₂(NO₂)₃OH_{1/2}(H₂O) 1.82 per cent H₂O. Cinchonamine picrate melts at 54° C., and after giving off the water it contains, forms a thick, mobile liquid which solidifies on cooling into a semi-crystalline gummy mass.

The authors have failed to obtain a crystalline phosphate or quinate, and Arnaud mentions that he has been unable to obtain a crystalline formate, acetate, or oxalate. In all these cases the product has been obtained only in a gummy mass.

This alkaloid differs very much from the rest of the cinchona group in the extreme insolubility and easy crystallisation of its nitrate, and the great solubility of, and difficulty in obtaining, the sulphate.

With regard to its valency, it has always been found to act as a monad radicle in combination with acids, forming, as described above, only one salt with the halogen acids, and two with sulphuric acid, the normal and acid salts.

Very little light can be thrown on the constitution of the alkaloid from the salts which have been investigated. The authors are now engaged in further work on the cinchonamine derivatives.

Solubility Curves of Cinchonamine. Halogen Salts.

1. Cinchonamine Hydriodide
2. Cinchonamine Hydrobromide
3. Cinchonamine Hydrochloride
4. Cinchonamine Hydrated Hydrochloride

DISCUSSION.

Dr. J. C. CAIN said he did not quite follow the advantage of using this base to form the insoluble nitrate as a test for nitric acid. What advantage did it possess over the usual ferrous sulphate test?

Mr. B. F. HOWARD said, in reply, that in certain cases a nitrate which could be readily precipitated might be of use.

NATURAL GAS IN WESTERN AUSTRALIA.*

BY E. A. MANN

(Government Analyst and Chief Inspector of Explosives for Western Australia).

Until recently the existence of firedamp was unknown in Western Australia, and strangely enough it made its appearance not in coal mines but in metalliferous

* Taken as read.

mines. In the Associated Northern Gold Mine, Kalgoorlie, on May 14th last, while sinking a diamond drill bore hole from the 1048 ft. level, when the drill reached a depth of 687 ft. a rush of gas occurred which inflamed on contact with a workman's candle, and was with difficulty extinguished. The flow of gas continued in diminishing quantity for about a month and then ceased, work being carried on meanwhile with safety lamps. Samples of the gas collected by the Inspector of Mines were submitted to me and two of the samples gave the following results on analysis:—

Sample odourless burning with blue flame.

	1.	2.
Carbon dioxide	0.28	0.33
Oxygen	5.36	7.70
Methane	56.50	42.50
Nitrogen (by difference)	37.86	49.47
	100.00	100.00

There was no action by fuming sulphuric acid, cuprous chloride, or palladium black. The absorption by potash after combustion was equivalent to half the contraction. The combustion was effected by an electrically heated platinum spiral.

It is supposed that the occurrence of this gas was in some way connected with the presence of a band of graphite schist in the Kalgoorlie formations. The samples analysed are of historic interest as being the first authentic specimens of the gas encountered in Western Australia.

THE SPIRIT STRENGTH OF ESSENCES.*

BY E. A. MANN.

Very little information is found in the ordinary textbooks on analysis of food and drugs in connection with the estimation of the true spirit strength of essences and other preparations in which the spirit holds in solution essential oils and other bodies which distil over with the spirit. Owing to the large number of these preparations examined annually in this laboratory, some experiments were made to determine the best and quickest methods of removing the obscuring substances.

Three methods were experimented with:—

1. That of Thorpe and Holmes (this J., 1903, 232). 25 c.c. of sample was taken, 100 c.c. of water added, the whole saturated with common salt, and shaken for five minutes with 70 c.c. of petroleum ether boiling under 60. The aqueous layer was separated and the petroleum ether shaken twice with 25 c.c. of saturated salt solution. The washings were added to the original aqueous solution, and the whole distilled slowly till 100 c.c. had distilled over. Multiply strength of distillate by 4.

2. Allen's method. (Commercial Organic Analysis, 3rd edition, vol. 1., 162.) Sample diluted eight times, calcium chloride and disodium phosphate added, 100 c.c. filtered off and distilled. Spirit strength of distillate multiplied by 8.

3. Method of the Association of Official Agricultural Chemists of America (Bulletin 46, U.S. Department of Agriculture, and "Food Analysis and Inspection" (Leach). Sample diluted four times, 5 grms. magnesium carbonate added, shaken, 100 c.c. filtered off and distilled. Multiply strength of distillate by four.

As Allen's method gives in some instances very dilute distillates, a modification was successfully tried, viz., concentrating the spirit by distillation into half the original bulk.

As a result of the experiments it was found that all the methods gave very concordant results, when the spirit

* Taken as read.

strength of the distillate was taken with a pycnometer but both the specific gravity balance and Sikes' hydrometer seriously sacrificed accuracy to speed. The American method appears to be preferable in many cases on the score of expedition, but does not in every instance give a clear distillate, and the same objection applies to Allen's method. The latter has been used very successfully for a long time in my laboratory, and the slight opacity sometimes obtained in the distillate does not, in my experience, seriously affect the result. For check purposes, and as a method applicable in all cases, Thorpe's method is undoubtedly the best, but the time necessary is a drawback in a busy laboratory. The use of the American method for ordinary work, and Thorpe's method for check purposes will probably be found an advantage.

DR. G. H. BAILEY IN THE CHAIR.

A NEW INDICATOR.

BY JAMES ROYLE WOODS, B.SC.

If 1 mol. of diazotised *p*-nitraniline is combined with 1 mol. of 2,5,7-aminonaphtholdisulphonic acid, it is known that a substance is formed having the following constitution:—

If now 23 grms. of this compound is boiled with 5.5 grms. of benzaldehyde, 100 grms. of hydrochloric acid (18° B.) and 900 grms. of water, for 15 minutes, the solution becomes colourless, and on cooling a compound crystallises out which has the following constitution:—

I have found that this substance is a very delicate indicator for acid and alkali titrations. It is more sensitive than either phenolphthalein or Methyl Orange, and gives sharper contrast in the colour reaction. In presence of acid the substance is colourless, and in presence of alkali intensely orange.

Another interesting feature is that, by its indication acetic acid can be accurately estimated volumetrically. It is also sensitive to carbonic acid.

Meeting held at Nottingham on Wednesday, November 29th, 1905.

MR. J. M. C. PATON IN THE CHAIR.

TAINT IN MILK DUE TO CONTAMINATION BY COPPER.

BY JOHN GOLDING, F.I.C., AND ERNEST FEILMANN, B.S.C., PH.D.

On February 2nd, 1905, a sample of milk was brought to the Midland Agricultural and Dairy Institute. The sample was taken from one of many churns which had been from time to time returned from London to Leicestershire with the complaint that a flavour had developed in the milk which was driving away the custom of the retailer. The milk was quite good when sent away, possessed very great keeping qualities, and was not sour when returned. The flavour developed was described as an alkaline mealy flavour, but was not very pronounced, and could not always be detected by persons tasting the milk. Samples of the water and food-stuffs used were sent for analysis and were followed by several more samples of the milk. On February 8th, one of us went to the farm and took samples into sterile tubes from all the cows, from the milk as it left the cooler, and from the churns in which it was sent to London. The customary advice was given and carried out as to cleaning and disinfecting the cowsheds, &c. The case presented many difficulties, and though the flavour seemed to be due to bacteriological infection after the milk had reached the churns, it could not be produced in other milk, nor could it be developed in sterile milk by any of the many organisms isolated from the samples sent. The milk from the churns developed the flavour, in varying degrees, in about eighteen hours. The trouble was at last traced to the cooler, which was an old one and had much of the tin worn off, exposing the brazing and copper. This cooler even after having been cleaned and boiled for three hours still caused the development of the flavour complained of in samples of milk from different farms which had been run over it. After the installation of a new well-tinned cooler at the farm, there were no further complaints. It was therefore practically proved that the worn cooler was the direct cause of the trouble, but further investigations were needed to clear the matter up.

The first point to investigate was the action of milk on copper. It was also necessary to ascertain if the flavour was due to the copper only, or to the combined action of the copper and other factors. It was found that milk when passed over the cooler took up small quantities of copper (in one case 2.5 parts per million) and though no flavour could ever be detected immediately, the characteristic flavour invariably developed after the milk had stood for about 18 hours at room temperature. Fresh milk (600 c.c.) left standing over a piece of clean copper foil (15 by 11 cms.) for one hour contained 3.5 to 4 parts of copper per million, while copper foil left in milk for 36 hours in an open vessel resulted in a solution of 45 parts of copper per million of milk. It was also found that air greatly aids in the solution of the copper in milk. Clean copper gauze fixed on the surface of some milk in a beaker, and left for one week, resulted in the solution of 121 parts of copper per million, while, in a similar experiment, in which the copper gauze was kept at the bottom of the beaker, only 48 parts of copper per million were found in the milk.

Blowing air through 300 c.c. of milk in contact with 10 grms. of clean copper turnings and leaving the milk in contact with the copper for one week resulted in the solution of 45 parts of copper per million; while in a duplicate experiment, but without air being passed through, 30 parts per million only were dissolved.

In all these cases a similar flavour to the one under investi-

gation developed in 12 to 18 hours, and became more pronounced in the course of a few days. Great keeping properties were also imparted to the milk. In the above-mentioned experiments fresh milk straight from the cow was taken, and clean glass vessels, not dairy utensils, were used. When, however, the milk was run into a vessel containing many lactic ferments no flavour was developed, and the milk went sour. Separated milk containing 0.25 per cent. of lactic acid dissolved 78 parts copper per million with air, and 49 without, in 44 hours. Copper oxide also dissolves in milk in the cold, and the characteristic flavour can develop in such milk. Copper sulphate also when dissolved in small quantities in milk permits of the development of the flavour. The blue colour produced in milk when much copper is in solution from any of the above sources gradually disappears on standing in the open, or on warming, the characteristic flavour becoming very marked. The milk afterwards develops a large number of micro-organisms.

The chemistry of the flavour is still only a matter of speculation, but similar flavours can be produced by other oxidising agents, such as potassium permanganate, ferric chloride and hydrogen peroxide.

Bacteriological Investigation.—A large number of organisms were isolated from the different samples of milk which had developed the characteristic flavour; but none of them developed the flavour in milk which had been sterilised by heat. When, however, the influence of the copper had been discovered, the experiments were repeated, and the flavour seemed to be developed by certain organisms, but was rather masked by the well-known taste of the sterilised milk.

In order to test the effect produced in fresh milk taken straight from the cow, two sterile Pasteur flasks were prepared, containing 0.2 grms. and 13 grms. of copper oxide respectively. These flasks were fitted with a milk tube attached to the side tube, so that milk could be taken straight from the cow without coming in contact with the outside air (see figure). The milk having been taken with all precautions, the flasks were removed to the laboratory, and the milk tube replaced by a sterile glass rod. Lengthy experience has shown that milk taken in this way will keep for many months without any heating or chemical treatment. The milk was tasted and

plate cultures were made after two days, six days, and eighteen days, but no mealy flavour had developed, although the copper could be tasted in the flask containing 13 grms. of copper oxide, 118 parts of which had gone into solution per million. In the other flask only about 30 parts per million had gone into solution in 18 days, and the copper flavour could scarcely be detected. Both samples were practically germ free, as shown by plate cultures.

In another experiment of the same kind, no flavour developed in three days, but the flavour had developed strongly in 18 days. Plate cultures, however, revealed the fact that the milk then contained over 100,000 organisms per c.c. Most of them proved to be a yellow, non-liquefying bacillus. A liquefying organism also producing a yellow colour was isolated from the first samples of milk sent for analysis, and this produced the flavour when inoculated into sterile milk containing copper.

The bacteriological investigation of a rather indefinite flavour, which is largely masked in heated milk, cannot be very satisfactory, but it seems certain that micro-organisms are not without influence in some direct or indirect way. It is also clear that if any particular organisms are essential to the production of the flavour they must be very widely distributed, for in all cases where fresh milk exposed to the air was contaminated with copper in our experiments, the flavour developed. It is also certain that the presence of copper is very injurious to the lactic ferments, for, although even when as much as 121 parts of copper were present per million, the milk developed acidity, this only took place after two weeks exposure to the air, in which time all the bluish tinge had vanished. If, however, the milk containing copper was run into a vessel containing many lactic ferments, or even into an ordinary cleaned dairy pail, the flavour did not develop and the milk went sour. This seems to explain the reason why this flavour has not been investigated before and does not seem to be of common occurrence. We have found traces of copper in a sample of milk sold in a town, and we cannot see how such milk can fail to contain small traces of copper when old or untinned coolers are used.

In conclusion, the above experiments clearly show that copper is acted upon by milk, especially in the presence of air, and that small quantities go into solution in the milk (from 1 part to over 100 parts per million). Fresh milk when thus contaminated is very liable to the development of a peculiar mealy flavour in 16 to 18 hours. This flavour seems to be due in part to the development of micro-organisms in the presence of copper, which both checks the development of the lactic organisms and also plays a more direct part in the actual development of the flavour.

The presence of copper from a worn cooler in the case under investigation was the practical cause of the development of the flavour, and the loss and trouble which resulted. There are many points still to be cleared up, but we hope that this paper will serve to arouse interest in the subject.

Our thanks are due to Mr. E. H. Earp, of Staunton Harold, for kindly sending samples of milk &c., for the investigation.

DISCUSSION.

Mr. H. DROOP RICHMOND said the taste of milk which led up to this paper had turned up over and over again in recent years. The question was a most important one bristling with difficulties which no one as yet had been able to overcome. He had for some years thought that the taste complained of was not due to copper because it was some time before it came out, but that it was due rather to micro-organisms, but the paper showed that both were active agents. He had succeeded in finding a liquefying micro-organism which he had no doubt was similar to that which the authors had just shown. The taste was chiefly found in milk which had been pasteurised in winter. In the summer it was not so marked. Neither was it so marked in the presence of a large number of lactic organisms. He had succeeded in getting rid of the taste by finding out where the organisms existed. He kept all

the vessels used thoroughly clean, and all the copper utensils were re-tinned when necessary; these precautions had got rid of the taste. By exposing various metals and alloys to the action of milk, all those which contained copper lost weight to extent that agreed with the quantity that the authors had found. The greatest action took place in the case of copper, but he had found the taste present when silver had been used. The paper had cleared up many points of great importance to the milk industry, and he highly appreciated it.

Mr. J. T. WOOD said it seemed to him that the development of the taste might to some extent be explained by the fact that a small amount of copper stimulated the development of certain organisms which did not develop in milk in which no copper was present. A similar case occurred with phenol, very minute quantities of which in solution excited the growth of certain organisms towards which in slightly larger quantities it acted as a powerful antiseptic.

Mr. S. R. TROTMAN called attention to a metallic haze that sometimes occurred in beer, and in which the metal had been found to be a combination with albuminoid. He inquired if the authors had tried the experiments with casein free milk.

Mr. A. L. HIND asked if any experiments had been made as to the action of milk on tin, for he had been informed that it was that metal which gave rise to trouble when using tinned copper vessels with other liquids (beer).

Professor F. S. KIPPING said he wondered why tin was put on the copper at all, unless because it was known that copper was attacked by milk. It seemed to him that the fact that milk acted upon copper was not one which should cause surprise, considering that the milk and copper were brought together in presence of atmospheric oxygen, and it was well known that under such conditions copper was readily acted upon by dilute solutions of salts, acids and alkalis.

Mr. J. GOLDING pointed out that in the winter months the action of the lactic ferments was not so great as in the warm weather, and that, therefore, the flavour-producing organisms would have a better chance of growing. One reason why the tin had gone from the copper was because of continual scrubbing with a hard brush and soda. The milk had been complained of in London as being chalky, and sticking to the glass, as well as having the unusual flavour. They had tried running albumin only over the cooler, but the solution of the copper seemed to be due entirely to the other constituents of the milk, constituents which were not present in beer. The extent to which copper was dissolved in water only was not determined in these experiments, but it was proved that the water and also some of the milk constituents in solution would not dissolve enough copper to be detected by the methods used. He thought that the milk had comparatively little action on tin. When the cooler was all tin there was no flavour produced. It was believed to be the lactic bacteria which caused the non-development of the particular organisms which caused the development of the flavour of the milk. It must have been noticed before that copper had some action on milk, otherwise the coolers would not have been tinned. He did not go so far as to say that the small quantity of copper discoverable had a very injurious effect on people consuming the milk, but at the same time it was a thing to be on the watch against and to prevent if possible. The flavour also was not a very disagreeable one, still it was not a desirable taste to have in milk, and had been the cause of much loss and trouble in the case which had been investigated.

PROP. SMITHELLS IN THE CHAIR.

THE OXIDATION OF OILS.

PART I.

BY H. R. PROCTER AND W. E. HOLMES.

(Contribution from the Leather Industries Laboratory of the University of Leeds).

The experiments which are described in the following paper were undertaken partly with a view to elucidate the chemical changes which take place when oils are oxidised by blowing air through them in a heated condition, and partly in the hope that distinctive curves of change would be obtained of a character useful in recognising different oils, alone, or in mixture with each other. A full discussion of the theoretical bearing of the observations made is hardly possible without further experimental work, and somewhat tedious calculation of results; but may possibly be dealt with in a second paper. Although the expectation of distinctive curves has only been partially fulfilled, certain characteristic differences have been observed, and the behaviour of the various oils is sufficiently interesting to be worth recording without delaying until a more complete discussion is possible.

The method of experiment which was finally adopted was to place 100 c.c. of each of the oils in a large test-tube placed in a water-bath, air being continuously blown through the heated oil by means of a water-pump, and samples being taken at regular intervals for examination. Four samples were generally blown at the same time.

The only detail of the apparatus which is worthy of special description, is the method adopted in order to prevent frothing, which, in the later stages of blowing, is sometimes very troublesome. Near the surface of the oil, and some little distance below the top of the test-tube, a perforated cork was fitted, through which the air-tube was passed, and in addition two small tubes open at both ends, of one of which the lower end was immersed in the oil, and served as a means of conveying oil from the broken froth back into the lower part of the tube, while the second tube did not project below the cork, but was drawn out to an almost capillary point above, through which the froth, if it formed, was obliged to force its way. In coming out through the orifice of this tube the bubbles are burst by the slight difference of pressure and by being drawn out, and the oil collecting upon the cork settles back through the tube first mentioned. The apparatus proved quite effective, though slight trouble was experienced with some very viscoid oils with which it became necessary occasionally to interrupt the blowing and break the bubbles with a glass rod.

Of course, it would be desirable that the air-supply should be exactly regulated, and of measured volume, and that the bubbles should be of the same size and number in each case; but to secure these conditions would be extremely difficult, and would have too far complicated experiments which were only intended to be preliminary. In the beginning of the research some samples were blown at a temperature of 60° C. instead of 100°, and the constants of gravity and refractive index were measured at the same temperature. It was, however, found easier, and on the whole more satisfactory, to blow at boiling temperature (at the elevation of the University slightly below 100° C.) and to determine the constants at 15° C., which was about the laboratory temperature.

Without exception, on blowing any oil, the gravity and the refractive index increase as oxygen is absorbed, and at the same time the iodine value, which is a measure of unsaturated linkages, diminishes as these become saturated with oxygen. In no case, however, was it found that in 24 hours' blowing the oil at all approached complete

saturation, and even in commercial-blown and oxidised oils the iodine value shows that saturation is far from total.

The gravity of the oils before and during blowing was taken in a small Sprengel tube, in order to limit, as far as possible, the amount of oil which was withdrawn, and after completing the weighing, the oil used was returned to the bulk in the blowing apparatus as soon as possible.

The refractive index was measured with a Zeiss refractometer (large model) in which the refractive index is read direct on a graduated sector, as figured in Lewkowitsch's "Oils, Fats and Waxes," 2nd edition, page 191. In the ordinary butter-refractometer the prisms are permanently adjusted so as to be achromatic for butter-fat and some other fats such as neat-foot oil, which are of similar dispersion, but many other oils show coloured fringes by white light, sometimes red, sometimes blue, so that sharp readings can only be obtained by the use of a monochromatic soda-flame. In the "large model" instrument a movable compensating prism is provided, by which it can be achromatised for any oil, so that white light can always be used, and from the compensation required the dispersion of the oil (*i.e.*, the difference between the refractive indices for the red C and the blue F line) can be calculated. As, however, the calculation is somewhat tedious, and no important object seemed to be served for the present in giving the absolute dispersions, the observed scale-numbers have been used throughout the series of experiments, but can, of course, at any time be calculated to absolute figures, using the table which Messrs. Zeiss supply with the instrument. It was hoped that marked differences would be observed in different oils, capable of being used in their recognition, but in most cases, the dispersions were almost identical, varying from about 30 to 40 scale-divisions, and either remaining constant during blowing, or rising one or two scale divisions as oxidation proceeded.

The iodine value was determined in all cases by the Hanus method, in which a solution of iodine bromide in glacial acetic acid is employed as the oxidising agent, and this was allowed to act on the oil for one hour, so as to make quite certain of the iodisation, most oils being completely iodised by this method in about ten minutes. The method was found rapid and convenient in use, and very constant in its results, which are somewhat higher than those of Hübl's original method, and slightly lower as a rule than those of Wijs.

Apart from the more theoretical conclusions, which it may be possible to draw later, there are certain practical aspects of the work to which attention may be drawn, though in generalising from so limited a number of experiments, the great difficulty of securing absolutely pure and typical oils, and the possibilities of experimental error must be steadily kept in mind. As regards the former of these points, however, we have good reason to believe in the authenticity of our samples, and our special thanks are due to Mr. W. S. Corder, who supplied us with samples of various fish and fish-liver oils, extracted under his personal supervision, and to Mr. G. W. Slatter, who provided us with samples of several other oils.

Inspection of the tables representing experimental results, leads at once, as was to be expected, to the conclusion that the process of oxidation is a somewhat complicated one. An interesting peculiarity which is striking in several oils (especially Moeller's cod-liver, and pale seal) is that the iodine value remains practically unaffected during the first three or four hours of blowing, though the rise of gravity and refractive index shows that oxygen is being absorbed. This, of course, indicates that the unsaturated linkages which are measured by the iodine absorption are still unopened, and that the oxygen is temporarily retained merely in solution, or in some other way than direct linking on the carbon chain. Usually, when the drop in the iodine value does set in, it proceeds rapidly for a time, as if the oxygen previously absorbed now took its place in the broken linkage. In other cases, as in castor oil, little or no change takes place in any of the constants during the first three hours of blowing, while in the second three it is relatively rapid, reminding of the oxidation of oxalic acid with permanganate, which at first is sluggish, and afterwards very rapid. These peculiarities

seem, as far as can be judged from the limited number of examples before us, to be rather characteristic of the particular sample than of the class of oil, and it may be obviously suggested that it depends on the degree of previous oxidation which the oils have undergone during manufacture or storage.

It is also obvious that, though in general terms it may be stated that the rise of gravity and refractive index, and the fall of iodine value proceed *pari passu*, they do not actually depend on the same chemical or physical change in the fat, since any one of them may increase for a time while another remains nearly or entirely stationary. It is very probable that the calculation of molecular refractions, or even of the "refractive constant,"* will throw some light on the nature of the changes which actually occur.

If we could assume that the reaction of oxidation was a simple one, taking place in a liquid of uniform constitution, which only changed by the conversion of the original fat into some constant oxidation-product, the curves obtained should obviously, according to the law of mass-action, be of a hyperbolic character, increasing or diminishing rapidly, so long as the oxidation-product formed only a small part of the mixture, and gradually approaching, but never reaching, a horizontal direction and a constant value. Kinks and irregularities such as actually occur can be explained in two ways. Firstly, if an oil (such as olive) consists mainly of olein, with a small percentage of some less saturated fat, say, the triglyceride of linoleic acid, we should expect that, once reaction had set in, the change would be rapid at first, till the whole or the greater part of the more oxidisable fat had been consumed, and should then proceed more nearly as the oxidation of the olein continues. Curves which suggest this frequently occur, as they must do, in oils containing a mixture of fats of different oxidisability. The second, and also probable explanation may be that in unsaturated fats the oxidation proceeds in successive stages, one linkage being attacked after another with different degrees of resistance, or linkages at first hydroxylated becoming oxidised with elimination of water. Polymerisation also undoubtedly takes place, varying the refraction and gravity, but probably not affecting the iodine value, or perhaps the refractive constant, in which the natural relation between refractive power and density is taken into account. At least it may be assumed that an abrupt change in the direction of any curve indicates a corresponding change in the course of the reaction, though it may be hard to ascertain its exact character.

It is already possible from the values and forms of the curves to distinguish very definitely between the more and the less oxidisable oils; and it is probable that, with systematic experiment, a curve might be drawn for any oil, serious deviations from which would indicate adulteration, and perhaps point to its character. It is also probable that such experiments would give useful information in processes which depend on oil-oxidation, such as oil-boiling, linoleum making, and chamoising and the manufacture of dégras; and might throw light on the liability of certain oils to "spic" or resinise when used for currying. It would probably be desirable to carry on the oxidising process for more than 24 hours in many cases, or to increase its intensity by using oxygen instead of air, or by the employment of higher temperatures. Thus in the case of the olive oil examined, changes in the direction of the curve between 21 and 24 hours indicate a change in the character of the oxidation which might have become more marked if the experiment had been carried further; and some of the other curves suggest the same idea.

As regards the changes in dispersion, and its amount, nothing with regard to its bearing on structure can at present be stated, but small as its variations are, they may, in some cases, prove useful in the identification of an oil. So far as can be judged from the oils examined, linseed, and a few of the liver-oils, alone have dispersions less than 40 scale-divisions, and the dispersion always tends to rise

as the iodine value falls on oxidation, so that it may be suggested that it is in some way dependent on unsaturated linkages.

The only oil in which the dispersion is notably high is the whale oil, of which the constants are given in Table IX., of which the original dispersion was 44.5, rising on blowing to 47.5, the other constants being quite normal. The refractive indices and dispersions of three other whale oils given in Table XX. are very constant, beginning at 39.9—40.0, and ending in all cases at 40.8, so that it is evident that high dispersion is not a usual characteristic.

All the oils were blown at 100° C., and the determinations taken at 15° C.

DISCUSSION.

Mr. F. W. RICHARDSON said he was specially interested in Prof. Procter's paper as he had done somewhat similar work on the same subject, although not going so far as to attempt to obtain curves. He would like to have heard some mention made about the effect of blowing on the viscosities of the ods. Personally, he found the refractive index agreed with the change in viscosity, and in later experiments he had only thought it necessary to determine the former constant. By using a piston worked by an electric motor with blower, and exposing the oils in a fine layer on a tray, he had been able to improve his method, so that the same result could now be obtained in 10 minutes which formerly required 10 hours. In this case, it was only necessary to use about 5 c.c. of the oil. Other data in the paper seemed to indicate polymerisation, and consequent increase in the refractive indices, specific gravities, &c. Had Prof. Procter tried the dispersion refractometer?

Mr. T. FAIRLEY said that in some recent work he had used oils which were, he believed, extracted by a process in which solvents were used in place of the older methods

of crushing and pressing. He thought, for instance, that rape oil was often now extracted with light petroleum. He would like to ask what effect rise of temperature had on the range of the refractive index. In explanation of the obscure chemical changes which were brought about by the blowing, he suggested that possibly acrolein or other aldehydes were produced in the oil. The tendency of such bodies to polymerise might account for the increased specific gravity.

Mr. F. W. BRANSON said that, from his experience of the manufacture of cod liver oil, it was possible to produce an oil of superior quality without an atmosphere of carbon dioxide, if the extraction were carried on rapidly and at a suitable temperature. Could Prof. Procter give any suggestions for differentiating between genuine cod liver oil and the same when mixed with a moderate proportion of other fish liver oils?

Prof. A. G. GREEN asked if the blowing brought about any saponification. If water took part in the reaction then this seemed probable. He had noticed cases in which hydrogen peroxide produced saponification, and perhaps something of this nature took place in the oils under consideration. It seemed possible that aldehydes might be formed by direct oxidation of double bonds. There was a tendency for unsaturated compounds to be split up, and to give two simpler aldehydes, which might possibly be ultimately further condensed. Was any glycerin eliminated in the process?

Mr. J. E. BEDFORD in his practical experience had found that the oxidation of oils for use in the manufacture of linoleum, and the conversion of linseed oil to the solid state, were accompanied by fall of iodine value and rise of specific gravity. He had also noticed the slow progress of the reaction at first, and the rapid development after a certain point was passed. Brin's patent oxygen plant had been used initially to supply the pure gas, but better results were afterwards obtained by the employment of more dilute oxygen or of air, probably because the nitrogen would sweep out acrolein, glycerin, and other objectionable by-products. To oxidise oils he recommended the "atomising" process instead of blowing, as the oxygen was thus brought into more intimate contact with the particles of oil. He thought polymerisation took place more readily in absence of oxygen and by simple application of heat.

Mr. H. WATSON asked if there was any difference between the volumes of the oils before and after oxidation, or if the increased specific gravity was due solely to chemical changes.

Prof. A. SMITHELLS wished to know if any special precautions had been taken to exclude moisture.

Prof. H. R. PROCTER, in reply, said that it would have been interesting to note the viscosities of the oils operated upon. This would, however, have interfered with the progress of the experiments, since large volumes of oil were required for these determinations. He believed it to be correct that the refractive index varied approximately in the same ratio as the viscosity. On blowing, all oils become more viscous and less soluble in liquids like petroleum ether, but more soluble in absolute alcohol. He was obliged for the suggestion of a piston for the blowing, and the "atomising" method might be good. Speed was not required in his case, however, as it took a considerable amount of time to carry out the other experiments on the oils at the various stages of the process. With regard to new methods of extraction, he thought less viscous oils were more readily expressed than viscous ones, and oxidised oils had different solubilities. Consequently, an oil extracted by crushing and pressing or steam would be very different from one obtained by the use of solvents. Increase in specific gravity was most likely due to absorption of oxygen, but how far polymerisation affected it, was difficult to say. Mr. Branson said that it was unnecessary to have an atmosphere of carbonic acid gas in the case of cod liver oil, if extraction were carried out rapidly at suitable temperatures. He would point out, however, that most careful exclusion of oxygen was necessary, since bodies might be formed which would

cause unpleasant taste or rancidity in the oil. He believed it would not be so difficult as was usually thought to differentiate between cod and other fish liver oils, if the method of obtaining curves was used. In answer to Prof. Green, he said that even if glycerine was produced in these oxidations, they had not attempted to determine it. A large amount would spoil the refractometer readings, by obscuring the sharpness of the division between the dark and light parts of the field, and this effect had been observed in some cases. It had been shown that bodies of an aldehydic nature, such as acrylic aldehyde, were formed by oxidation of oils on skin, as in the preparation of chamois leather, and Mr. A. G. Perkin had observed the formation of higher aldehydes, such as were suggested by Prof. Green, in the oxidation of linseed oil. The very high iodine value of Möller's cod liver oil, as compared with medicinal oils extracted in the ordinary way, seemed to indicate that in the latter case, considerable oxidation

had occurred. He was aware of the fact that polymerisation took place in absence of air, but his present object was not to study polymerisation. It was impossible to measure the volumes of the oils, so no information could be given as to the effect of blowing in this direction. No special precautions were taken to dry the samples, which were known to contain only a small proportion of water.

Mr. FAIRLEY showed a number of lantern slides illustrating the early history of distillation in this and other countries. The process of distillation was not invented by the Arabians, but was conveyed by them from the East, where it has been practised from the earliest times. It may have been discovered independently in various countries, but the earliest evidence relating to it comes from China, Hindustan and adjacent countries.

In the British Islands, the knowledge probably came direct into Ireland from the East.

PATENT SPECIFICATIONS may be obtained by post by remitting as follows:—

English.—8d. each, to the Comptroller of the Patent Office, C. N. Dalton, Esq., Southampton Buildings, Chancery Lane, London, W.C.

United States.—1s. each, to the Secretary of the Society.

French.—1 fr. 25 c. each, to Belin et Cie, 56, Rue des Francs-Bourgeois, Paris (3*).

I.—PLANT, APPARATUS, AND MACHINERY.

(Continued from page 1218.)

ENGLISH PATENTS.

Vacua; Production of High —, and Cooling by Evaporation. C. A. Parsons, Newcastle on Tyne. Eng. Pat. 14,042, June 21, 1904.

SEE Fr. Pat. 355,181 of 1905; this J., 1905, 1162.—T.F.B.

Presses for Expressing Liquids; Impts. in —. J. Macgregor and G. C. Pearson, Old Charlton, Kent. Eng. Pat. 28,456, Dec. 27, 1904.

Two or more vertical cylinders are rotated eccentrically one within the other, so that the space between the cylinders is wider on one side than on the other. The material to be pressed is fed in at the widest side and is carried round and compressed, being removed by a scraper from the point at which the cylinders approach nearest to one another. If desired, the material under treatment may be submitted to the action of the electric current, by connecting the poles of a source of electric current to the inner and outer cylinder respectively.—W. H. C.

Scale in Boilers; Means and Method for Removing and Preventing the Formation of —. I. Klecan and F. Laska, Vienna. Eng. Pat. 645, Jan. 12, 1905.

A PERFORATED vessel charged with pieces of red oak bark is suspended in the boiler. The matters extracted from

the bark by the boiling water loosen any scaly deposit already formed on the sides of the boiler and prevent further incrustation. The vessel is removed from the boiler after a time and re-charged as occasion may require. (Reference is directed, under The Patents Act, 1902, to Eng. Pat. 10,423 of 1885; this J., 1886, 454.)

—W. P. S.

Drying Gelatin, Glue, Paste Goods, Brewer's Grains, Bricks, Woods, Metal Articles and the like; Apparatus for —. O. Koepfl, Goepfingen, Germany. Eng. Pat. 5748, March 18, 1905.

THE invention relates to drying apparatus in which the material to be dried is placed on trays or "hurdles," which are moved alternately backwards and forwards in tiers in a drying chamber. As the trays reach the end of each tier, they are lifted vertically to the tier above, by endless chains, having projections which engage with the trays, or by cranks attached to vertical shafts. By an arrangement of cams and guide rollers, the lateral movement is arrested, and the ropes carrying the trays are displaced, so as not to interfere with the lifting.

—W. H. C.

Separators; Impts. in Centrifugal Liquid —. C. W. Dawkins, London. From Massey-Harris Co., Ltd., Toronto, Canada. Eng. Pat. 7495, April 8, 1905.

"A LINER for centrifugal liquid separators" is formed by a series of superimposed discs shaped like frustums of hollow cones. The upper edges of the discs are scalloped and their upper surfaces are provided with a number of

helical ridges forming helical channels between the discs. The liquid is fed from above through holes in the top of the upper disc and it is distributed by vertical channels passing down within the central hollow space.—W. H. C.

UNITED STATES PATENTS.

Furnace; Heating — C. P. Turner, McKeesport, Pa. U.S. Pat. 805,041, Nov. 21, 1905.

THE furnace consists of a stationary floor 1, provided with openings 2, 2, through which the plungers 3, 3 pass. An upward and downward motion is imparted to the plungers 3, 3, which are attached to the girder 4, by means of the "bell-cranks" 5, 5. The material to be treated is carried on the horizontally moving support 6. —W. H. C.

Kiln; Rotary — J. H. Logan and W. H. Simmons, Fenton, Mich. U.S. Pat. 805,213, Nov. 21, 1905.

THE kiln is formed of two cylinders 1 and 2 arranged in line. The material is fed into the first, which is provided with the agitators 16, 17, 18, and is delivered into the second, from the further end of which it is discharged, when the treatment has been completed. The end of the cylinder 1 is tapered and extended into the second as shown, and the two cylinders can be rotated at different rates of speed.—W. H. C.

FRENCH PATENTS.

Vacuum; Process for Producing and Maintaining — Soc. l'Air Liquide (Soc. Anon. pour l'Etude et l'Exploitation des Procédés G. Claude) and A. J. Levy. Fr. Pat. 350,205, Oct. 4, 1904.

THE process consists in successively connecting the vessel in which a vacuum is desired, to a number of vessels containing an absorbent for the gas, such as charcoal. The absorbing vessels are cooled by being plunged into liquid air or some other suitable refrigerant. When the first absorbing vessel has abstracted as much gas as possible, it is shut off and the next connected, and so on, until the required degree of exhaustion has been attained. The absorbing vessels and their contents may be used several times without being heated, to drive off the absorbed gas, if they are kept in the cooling liquid and used in a systematic order. Claim is also made for maintaining the vacuum in double-walled vessels, by the use of an absorbent, contained in a pocket in communication with the space between the walls, which absorbent is cooled by the liquefied gas contained in the inner space.—W. H. C.

Separator; Continuous Centrifugal — E. Pautet. Fr. Pat. 350,225, Oct. 14, 1904.

THE liquid is fed on to horizontal discs having undulating edges which are enclosed in a flattened drum, the whole being rotated by a shaft. The denser portions are thrown

to the inside of the cylindrical walls of the drum, where they are pulverised by an iron ball which is kept to the side of the drum by electro-magnets fixed on the rim. —W. H. C.

Separation of Bodies in Suspension in Liquids; Process for — C. Hannig. Fr. Pat. 356,522, July 29, 1905.

THE liquid to be clarified is fed by the gutters 10 into the spaces 4, 6, 8, and after passing below the partitions 3, rises through the spaces 5, 7, 9 and overflows by the gutters 11. By the use of the gutters for the introduction and withdrawal of the liquid, disturbance is avoided, and the solid impurities settle quickly to the bottom, from which they are discharged through the opening 2. By partially closing the bottom opening of the spaces 4, 6, and 8, the deposited solids may be made to act as a filtering layer to assist in the clarification.—W. H. C.

Vapours of Volatile Liquids; Apparatus for Separating and Condensing — H. Heymann, H. Hey, J. Smith, H. L. Mitchell, and W. H. Askham. Fr. Pat. 356,678, Aug. 5, 1905. Under Int. Conv., Aug. 10, 1904.

Acetylene; Application of — in Autogenous Soldering. S. Traubel. X., page 1308.

ENGLISH PATENTS.

Coke; Manufacture of — H. Hennebutte, Haine St. Paul, Belgium. Eng. Pat. 22,002, Oct. 12, 1904.

FOR the manufacture of metallurgical coke from lignites, steam coal or close-burning coals, these are pulverised and hydrocarbons rich in carbon are added for the purpose of producing "cementation carbon" in the nascent condition, by the dissociation at a high temperature of the substance added. The latter may consist of molasses or of tar rendered soluble in water by treatment with alkalis. An addition of dry pulverised pitch or resin may be made to coals which give up their hydrocarbons at a very low temperature, in order to raise the point of decomposition. —R. L.

Coke; Processes for Producing Compressed Non-Porous Blocks or Briquettes of — A. D. Shrewsbury, Washington, D.C., U.S.A. Eng. Pat. 14,061, July 7, 1905. Under Int. Conv., Aug. 15, 1904.

WHILST in a plastic or "agglutinate" condition, the coke is discharged from the retort into a hopper under-

neath, where it is passed between rollers that are recessed to form moulds, in which the coke is compressed to briquettes. The latter are returned to the retort, through a hopper at the top, in order to expel the residual gases they contain, and are afterwards re-compressed as before, the process being repeated if necessary.—C. S.

Briquettes of Coaldust or Powdered Peat; Manufacture of —. W. van der Heyden, Paris. Eng. Pat. 19,539, Sept. 27, 1905. Under Int. Conv., Oct. 7, 1904.

SEE Fr. Pat. 346,861 of 1901; this J., 1905, 236.—T. F. B.

Furnaces; Impts. in —. G. Wilton, London, and T. Wilton, Beckton. Eng. Pat. 24,785, Nov. 15, 1904.

THE claim is for an improvement in the form of the

blast-pipe of furnaces, described in Eng. Pat. 9309 of 1895 (this J., 1895, 710), and consists in constructing the outermost pipes as shown in section at a^3 in the figure, the upper surface a^1 being flat, whilst the lower surface a^2 conforms to the contour of the flue c . The blast and fuel area is thus enlarged and the burning away of the outer pipes, which were circular in section, by the fuel which lodged between them and the flue wall, is prevented.—W. H. C.

Furnaces [for Liquid Fuel]; Impts. in —. E. Scherling, Paris. Eng. Pat. 29,361, Dec. 31, 1904.

A MIXING chamber A is placed in front of the fire-box G and communicates with it by the tuyères E and F. Liquid

fuel is delivered through the injector I, actuated by steam or compressed air, into the distributing pipe J, and passes thence through the small bore pipes j , held by the stirrup K, into the pipe C. From C the jet of fuel passes through C^1 to the tuyère E, being mixed with a further supply of compressed air or steam delivered by the pipe B. As the jet of fuel and steam or air passes through C^1 , it draws with it, through the apertures e , a mixture of air and hot gas from the mixing chamber A. The air enters this chamber through the end A^1 , and the hot gas through the tuyères F. Further claim is made for placing air pipes or blowers, actuated by steam, beneath the fire-bars.—W. H. C.

Furnaces for Burning Producer Gas. W. L. Harder, Woodlawn, U.S.A. Eng. Pat. 13,263, June 27, 1905.

SEE U.S. Pat. 793,070 of 1905; this J., 1905, 837.—T. F. B.

Gas-Producing Plants; Impts. in —. H. J. Grice, Birmingham. Eng. Pat. 1843, Jan. 31, 1905.

THIS patent relates to an arrangement by which gas producers generate their own steam, and is preferably for use in conjunction with the producer plant described in Eng. Pat. 16,067 of 1904 (this J., 1904, 929). On the top of the generator is fixed a hollow metal vessel, which forms the boiler. Into pockets, projecting from this vessel, are inserted "stop-ended" tubes which pass vertically, for any desired distance, into the fuel of the generator below.—W. C. H.

Carburising Air; Apparatus for —. F. W. Howorth, London. From H. Reeser, Courbevoie, France; J. G. Schmidinger, St. Gall, Switzerland, and C. Philippe, Brussels. Eng. Pat. 2770, Feb. 10, 1905.

Vaporising Liquids [for Combustible Gas for Explosion Motors]; Devices for —. A. Hayes, New York. Eng. Pat. 10,404, May 17, 1905.

AN intermittent current of air is passed through a double set of downward and upward spiral passages surrounding a central heating pipe. On reaching the bottom of the device the partly heated air traverses valves communicating with sources of oil and water supply, and arranged in such a manner that, by means of vanes, each valve turns round slightly every time it is lifted and thereby exposes a film of oil or water respectively to the current of air. The resulting mixtures of air with oil and water respectively then ascend through separate spiral passages, which unite at a higher level, and the mixtures are thus heated by the central pipe, so as to complete the vaporisation of the oil and water. Finally the mixture is passed through a similar valve at the top of the apparatus, where it takes up a further quantity of oil in the same manner as before.—C. S.

Gas Purifying Materials; Treatment of — for the Recovery of Useful Products, and Apparatus therefor. J. J. M. Béguenot, Nantes, France. Eng. Pat. 8530, April 20, 1905. Under Int. Conv., July 23, 1904.

SEE Fr. Pat. 345,071 of 1904; this J., 1904, 1216.—T. F. B.

UNITED STATES PATENTS.

Peat; Drying Retort for —. C. A. Sahlström, Ottawa, Canada. U.S. Pat. 805,030, Nov. 21, 1905.

A NUMBER of horizontal cylinders, communicating with each other by passages between, are mounted, above a source of heat, in an outer structure. Heating flues extend from the source of heat around the entire length of each cylinder, and open into the top cylinder which is also provided with an outlet for the heating gases. The peat is fed into the top cylinder, and is caused to pass through each cylinder in succession, by means of rotating conveyors consisting of shafts provided with longitudinal paddles or blades, and also with spirally-disposed blades secured to and extending between the longitudinal blades. The top cylinder is furnished with a jacket, into which the steam from the lower cylinder is led, means being provided for drawing off the steam and condensed water from the jacket.—A. S.

Producer Gas Furnace. P. Schmidt and A. Desgraz, Hanover, Germany. U.S. Pat. 805,235, Nov. 21, 1905.

Combustible [Briquette]; Agglomerated —. [Utilisation of Waste from Cloth Finishing.] G. Merceron. Fr. Pat. 356,244, July 19, 1905.

CLAIM is made for the use of the residues from the process

of finishing cotton or other cloth, as an agglutinant for making fuel briquettes. The proportions advised are to every 1000 parts of fine coal, from 70 to 100 parts of water and from 50 to 70 parts of agglutinant.—W. H. C.

Oxygen and Steam; Apparatus for the Production of a Mixture of —, for Supporting Combustion. G. V. L. Chauveau. Fr. Pat. 350,218, Oct. 12, 1904.

THE apparatus is designed for the production of a mixture of oxygen and steam, to be used instead of air as the supporter of combustion in furnaces, generators, gas engines, &c. Water is fed into a vertical tubular boiler, which is provided with a steam-dome and is heated by the circulation of hot gases (say, the waste gases from a gas engine) round the boiler tubes. Oxygen gas, from a cylinder or other suitable source, is admitted through a pipe into the steam-dome, and is caused to bubble through the water therein, the mixture of steam and oxygen being then led off to the place of consumption. Instead of separate supplies of oxygen and water, oxygenated water may be employed, in which case the liquid is admitted at the foot of the heating tubes; the latter are made in zig-zag form and of very small diameter, to ensure the simultaneous vaporisation of the water and oxygen.

—H. B.

Combustion in Generator Furnaces for Retort or other Ovens; Process for the Regulation of the Temperature of —. H. L. Doherty. Fr. Pat. 356,236, July 19, 1905. Under Int. Conv., Oct. 25, 1904.

By the introduction of a mixture of the waste gases of combustion, in suitable proportions, along with air in suitable proportions, beneath a thick bed of incandescent fuel in the generator, the temperature is kept below that at which troublesome clinkering takes place.—W. H. C.

Combustible Fluid for Explosion Motors. L. A. A. Hennequin and G. J. B. Cayeux. Fr. Pat. 350,210, Oct. 6, 1904.

Gas of High Calorific and, if desired, High Illuminating Value; Process and Apparatus for the Manufacture of —. P. Sabatier. Fr. Pat. 356,471, June 17, 1905.

STEAM is passed over reduced iron at a temperature of 1000° C., whereby pure hydrogen and oxide of iron are obtained, the hydrogen being collected in a holder. Simultaneously, purified water-gas is passed, at 1000° C., over oxide of iron resulting from a previous operation as above, the gas being thus converted into a mixture of carbon monoxide and dioxide, whilst the reduced iron formed is used to act upon steam in the succeeding operation. The mixture of carbon monoxide and dioxide is passed through a cold alkali carbonate solution, whereby the dioxide is fixed as bicarbonate, the monoxide being utilised in any convenient way. The solution of bicarbonate is heated and the carbon dioxide is expelled and collected in a holder, the carbonate produced being used *de novo* for separating further quantities of the gases. The purified hydrogen and carbon dioxide are now mixed in suitable proportions and passed, at a temperature of 250°–500° C., over metallic iron, nickel or cobalt (reduced from the oxides), whereby methane is produced, according to the equation: $\text{CO}_2 + 4\text{H}_2 = \text{CH}_4 + 2\text{H}_2\text{O}$. After condensing the water, the methane can be mixed with hydrogen in any desired proportions, to obtain a gas of high calorific value. If a high lighting power is also desired, the methane and hydrogen are mixed with a small proportion of acetylene and passed over iron, nickel or cobalt at 50°–180° C., at which temperature the methane is unaffected, whilst the acetylene is converted into ethylenic hydrocarbons of high illuminating value. The apparatus is constructed with several heat-interchanging devices whereby the heating and cooling of the gases and liquids are effected without the aid of external sources of heat.—H. B.

Gaseous Mixtures; Method of Examining —. Soc. C. Zeiss. Fr. Pat. 356,388, 1905. XXIII., page 1326.

GERMAN PATENTS.

Fuels rich in Volatile Substances; Process for Improving — by Treatment with Hot Gases. O. Hörenz. Ger. Pat. 161,952, Oct. 22, 1903.

It is stated that fuels rich in volatile matter may be transformed into smokeless fuels by expelling the volatile constituents by treatment with hot gases under strong pressure. According to one claim the pressure is produced by the volatile constituents expelled from the fuel, a certain quantity of hot gases being introduced into the vessel containing the fuel, which vessel is then hermetically closed.—A. S.

Acetylene; Process for the Purification of — by means of Bleaching Powder. H. Ditz. Ger. Pat. 162,324, March 11, 1903. Under Int. Conv., Dec. 22, 1900.

THE claim is for the use of bleaching powder of the composition represented by the formula: $\text{CaO} \cdot \text{CaOCl}_2 \cdot \text{H}_2\text{O} + \text{H}_2\text{O}$, or, in the anhydrous condition, $\text{CaO} \cdot \text{CaOCl}_2 \cdot \text{H}_2\text{O}$ (see this J., 1901, 247). Bleaching powder of this composition does not evolve chlorine on heating, so that when used for the purification of acetylene, neither nitrogen chloride nor an explosive mixture of chlorine and acetylene can be produced.—A. S.

III.—DESTRUCTIVE DISTILLATION, TAR PRODUCTS, PETROLEUM, AND MINERAL WAXES.

(Continued from page 1221.)

ENGLISH PATENTS.

Saturator for Sulphate of Ammonia and other Salts; Improved "Self-discharging" —. G. Pettigrew, Middlesbrough-on-Tees. Eng. Pat. 2840, Feb. 11, 1905.

IS a saturator of a circular type, having a hopper-shaped bottom with valved outlet for discharge of the ammonium salt produced, an annular recess is formed inside the hopper, to receive a circular perforated pipe connected to the vertical pipe by which the ammonia gas enters. The circular pipe, thus bedded, presents no obstruction to the descent of the salt for discharge. Alternatively, the channel may be formed externally upon the hopper, in which case the ammonia is led into the channel, and enters the saturator through holes provided in the sides of the same.—E. S.

Pyridine and Similar Organic Bases; Manufacture and Recovery of —. R. Lessing and T. Wilton, London. Eng. Pat. 4766, March 7, 1905.

PYRIDINE and similar organic bases, traces of which are usually contained in crude ammoniacal gas liquor, may be recovered by washing the waste gases escaping from ammonium sulphate saturators or the aqueous condensate obtained on cooling these gases, with a tar or other suitable oil, and extracting the bases from the absorbing oil; or the gases or the aqueous condensate may be treated with sulphuric acid to form sulphates of the bases. This can be done directly or by redistilling the condensate in an ammonia-still and receiving the vapours in acid. In certain cases the bases may be extracted by directly washing the crude gas liquor with a suitable oil.—R. L.

Mineral or Petroleum Oils; Refining —. T. Macalpine, Chiswick. Eng. Pat. 28,243, Dec. 23, 1904. (See Eng. Pat. 18,728 of 1902; this J., 1903, 944.)

A CLOSED vessel is charged with a supersaturated solution of saline substances, preferably sodium chloride and sodium carbonate in equivalent proportions, and the oil is introduced through a perforated pipe or pipes at the bottom of the vessel, so as to ascend in a finely divided state through the solution and crystals. The oil runs away through an overflow at the top, and after standing, to remove any mechanically conveyed portions of the saline solution, is distilled with the aid of low-temperature-

wet steam and an oxidising agent. (See this J., 1900, 349.) The saline solution may be replaced by broken coke.—C. S.

FRENCH PATENT.

Petroleum and other Liquids; Fractionating ——. V. Huglo. Fr. Pat. 356,152, July 13, 1905.

THE decomposition of the oil by local overheating is prevented by the aid of suitable stirrers, which keep the contents of the still in motion. The distilled vapours are led into a condenser consisting of a bundle of tubes cooled by air from a fan, aided by a water spray. This condenses the heavier fractions, which may be collected or returned to the still, whilst the lighter fractions are condensed in a separate bundle of tubes surrounded by cold water.—C. S.

GERMAN PATENTS.

Paraffin from Tars, especially Lignite Tars, containing the same; Process for Obtaining ——. A. Schultze. Ger. Pat. 162,341, Sept. 3, 1904.

THE oils of lower boiling point are removed from the tar by distillation, the residue is allowed to cool, and the solid portion removed by pressing, or by means of a centrifugal machine. &c. 250 kilos. of lignite tar are heated to 130° C., and steam is blown through it until 30 kilos. of oil have passed over. The residual tar is allowed to stand for 36 hours to crystallise, when it is treated in a centrifugal machine. The higher boiling-point oils are thus removed, leaving the solid paraffin as a cake, which is pressed to remove adherent oil, and refined in the usual manner. This process is stated to give a high yield of solid paraffin, and to reduce the amount of soft paraffin to a minimum.—T. F. B.

Petroleum; Process for Removing the Sulphurous and Non-Sulphurous Impurities from ——. C. Deichler and R. Lesser. Ger. Pat. 160,717, Jan. 22, 1904.

THE sulphurous and other impurities, including aromatic hydrocarbons, phenols, &c., are removed from petroleum or its distillates by treatment with metallic sodium. In addition to forming sulphides, the sodium is stated to act catalytically; a large proportion of the metal can be recovered after the process, since it only becomes covered with a carbonaceous deposit. 500 kilos. of crude petroleum may be heated for an hour with 5 kilos. of sodium, in a vessel fitted with reflux condenser, and then distilled, with constant agitation.—T. F. B.

IV.—COLOURING MATTERS AND DYESTUFFS.

(Continued from page 1224.)

*Amino-*p*-dichlorobenzene; Contribution to the Knowledge of* ——. E. Noelting and E. Kopp. Ber., 1905, 38, 3506—3515.

2,5-DICHLOROANILINE is a weak base, the salts of which are, to a large extent, decomposed by water. The following method is recommended for diazotising dichloroaniline:—

Sixteen grms. of dichloroaniline ($\frac{1}{17}$ mol.) are dissolved in a hot mixture of 40 c.c. of sulphuric acid (66° B) with 100 c.c. of water, which is then rapidly cooled with good stirring, so that the base may separate out again in a very finely divided state. After cooling to 5° C. a solution of 7.2 grms. of sodium nitrite in 15 c.c. of water is gradually added. The dichloroaniline gradually disappears and a yellow solution of the diazonium sulphate is obtained. In order to prevent the formation of the diazoamino body at least 7–8 mols. of acid must be used in diazotising. The formation of the diazoamino compound is completely obviated if *p*-chloroaniline (16 grms.) be dissolved hot in 50 c.c. of concentrated sulphuric acid, and the quickly-cooled solution diazotised with a solution of 7.2 grms. of sodium nitrite in 50 c.c. of concentrated sulphuric acid at a temperature not exceeding 20° C. The diazonium sulphate and chloride are very stable in aqueous solution. A dilute solution acidified with hydrochloric

acid was found to have lost practically none of its strength after standing for two weeks. There was no smell of phenol. By boiling the diazonium compound in strongly acid solution for two hours, the authors obtained a 90 per cent. yield of 2,5-dichlorophenol. The more strongly acid the solution, the better is said to be the yield. 2,5-Dichlorophenol is sparingly soluble in water, readily soluble in some organic solvents, and has a strong smell of phenol. The solution in dilute alcohol reddens litmus paper and decomposes alkali carbonates on boiling. It is obtained by distillation in colourless crystals, m.pt. 57° C., b. pt. 211° C. at 744 mm.

The authors combined diazotised dichloroaniline with R-salt, G-salt and B-acid. They found that the dyestuff-produced shades equally strong and equally level but of much yellower tone than those produced by the corresponding aniline combinations, Ponceau 2G, Orange G, and Fast Acid Magenta. The shade of the B-salt combination was practically undistinguishable from that of Orange III. (diazotised *m*-nitraniline+R-salt) and the combination with salicylic acid gave shades almost identical with those of Alizarin Yellow 2G (diazotised *m*-nitraniline+salicylic acid). The two chlorine atoms in 2,5-dichloroaniline thus exercise the same tinctorial influence as the one nitro group in the meta-position.

Tetrachlorodiazaminobenzene was prepared by diazotising dichloroaniline in acetic acid solution. The corresponding aminoazo body was obtained by heating 3.5 grms. of tetrachlorodiazaminobenzene to 105°–110° C. for forty-five minutes with 2 grms. of dichloroaniline hydrochloride and 14 grms. of dichloroaniline. The yield was 2.5 grms. Tetrachloroaminoazobenzene thus prepared, may be easily diazotised by treating its solution in concentrated sulphuric acid with nitrosyl sulphate, and then warming on the water-bath. A garnet-red dyestuff is produced by diluting this diazo solution with ice and combining with alkaline β -naphthol.

1,2,5-Aminodichlorobenzene-4-sulphonic acid was prepared by heating dichloroaniline for about two hours to 170°–180° C. with three times its weight of fuming sulphuric acid containing 18 per cent. of anhydride. On adding nitrite to this sulphonic acid suspended in a finely divided state in dilute hydrochloric acid, the diazonium anhydride is obtained in very stable white needles. This is converted into dichlorophenylhydrazinesulphonic acid on reduction with stannous chloride. From the latter substance a Tartrazine was prepared, which, it is said, dyes a very fine canary-yellow shade.

On nitrating dichloroaniline with fuming nitric acid, a mixture of about 1 part of the *o*- and 5 parts of the *p*-derivative is obtained. (See Beilstein and Kurbatow, Annalen, 196, 222.) The authors find that by nitrating with a mixture of nitric and sulphuric acids at 40° C., the *p*-derivative melting at 145°–146° C. is exclusively obtained. These dichloro-*o*- and -*p*-nitranilines on reduction yield the corresponding dichlorophenylenediamines, of which the dichloro-*o*-phenylenediamino of m.pt 100° C. is new. It is best purified by sublimation, crystallises in white needles which do not change on keeping, and can be condensed with phenanthraquinone.

—H. L.

Triphenylmethane Dyestuffs; Action of Sulphurous Acid on ——. K. Dürschnabel and H. Weil. Ber., 1905, 38, 3492—3494.

THE authors treated pararosaniline with sulphur dioxide and obtained the following three distinct substances:—

(1) The acid sulphite $C_{15}H_{19}N_3O + H_2SO_3$ is prepared by passing gaseous sulphur dioxide into a suspension of 1 gm. of pararosaniline in 40 c.c. of water, until it is completely dissolved to an orange-yellow solution. The excess of sulphur dioxide is then boiled off. The solution, which has turned red, is allowed to cool, and the faintly red crystals of the acid sulphite which separate, are filtered off, and dried at the ordinary temperature. The substance is sparingly soluble in water and alcohol. When heated to 90° C. it loses a molecule of water and passes over into the quinonoid salt.

(2) The neutral sulphite $(C_{15}H_{17}N_3)_2H_2SO_3$ is obtained by boiling the acid sulphite with 40–50 parts of water. The solution becomes deeply coloured and the acid

sulphite is converted into lustrous metallic green crystals, which are filtered from the hot liquor. The neutral sulphite is very stable; it is not decomposed by prolonged boiling with a solution of sodium carbonate, but it is converted into pararosaniline base by hot caustic soda.

(3) *Triaminotriphenylcarbinol-sulphonate acid* $C_{19}H_{19}N_3SO_3 + 3H_2O$ is prepared by treating pararosaniline suspended in very little water with sulphur dioxide until it is completely dissolved. On standing, fine yellow crystals are obtained of the above formula. One molecule of water of crystallisation is lost on keeping.

The substance dissolves for an instant in very dilute sodium carbonate, but is then almost immediately decomposed with separation of the neutral sulphite.

From Melaehite Green or Crystal Violet and sulphur dioxide, the authors only obtained in each case one colourless substance, whether "leuco-sulphonic acid" or salt, could not be determined.—H. L.

Rhodamines: Contribution to the Knowledge of —. E. Noetting and K. Dziewonki. *Ber.*, 1905, **38**, 3516—3527.

RHODAMINES are to be regarded as diamino derivatives of fluorane

THE colourless bases like fluorane itself and dichloro-fluorane (fluorescein chloride) doubtless possess the lactone formula. The constitution of the salts is uncertain. The authors show that the amino groups in the rhodamine dyestuffs occupy the position para to the fundamental carbon by condensing *o*-amino-*o*-cresol with phthalic anhydride. The dyestuff so obtained, produces shades exceedingly similar to those of typical rhodamines, and a condensation in the *o*-position is in this case impossible.

Tetramethyl-rhodamine base $C_{24}H_{32}N_2O_2 + 2H_2O$ is obtained by treating a solution of the hydrochloride with dilute caustic soda, and is almost insoluble in water or excess of alkali. It is readily soluble in 30–40 per cent. alcohol, from which it crystallises in green metallic leaflets, which contain three mols. of water. These green crystals dissolve in boiling ether, benzene, toluene or xylene to a colourless solution, and crystallise from xylene in colourless needles which contain a molecule of xylene. The xylene is expelled by heating the substance to 130°–150° C. The base free from xylene is colourless, melts at 232° C., and dissolves in concentrated sulphuric acid with orange-yellow colour.

Tetraethylrhodamine base $C_{28}H_{40}N_2O_3 + 4H_2O$ is obtained by heating the hydrochloride with very dilute caustic soda and filtering hot. Green needles are obtained from the filtrate on cooling, which dissolve in alcohol and water with a red colour, possessing a green fluorescence. The solution in benzene, ether, &c., is colourless. The anhydrous base is colourless and melts at 165° C.

Diethylhomorhodamine hydrochloride

(Friedländer IV, 263) is converted into the free base $C_{25}H_{31}N_2O_3 + (C_2H_5OH + H_2O)$ containing, as shown, alcohol of crystallisation, by treatment with concentrated ammonia and subsequent recrystallisation of the product from dilute alcohol. It crystallises in green leaflets, which dissolve in boiling xylene to a colourless solution, but crystallise from this solvent on cooling, in red leaflets with a golden lustre, which contain xylene. On heating to 175° C., the xylene is expelled and the base is obtained as an amorphous red substance $C_{25}H_{24}N_2O_3$, m. pt. 210° C. It could not be obtained in a colourless modification, the green crystals decomposing before giving up all their water of crystallisation. *Mono-acetyl-diethyl-homorhodamine* crystallises in white needles m. pt. 257°–260° C. It is soluble in hydrochloric acid in the cold, and produces a light red salt which dyes cotton mordanted with tannin a fine yellowish-red shade of equal intensity, but less fast to light than that produced by the non-acetylated substance.

Symm.-diethylrhodamine base $C_{24}H_{32}N_2O_3 + H_2O$ is obtained by treating the hydrochloride with alkali and

recrystallising from dilute alcohol. It crystallises in bluish-red leaflets, which, on drying, become an amorphous olive-green mass. It dissolves in xylene with a faint red colour, and is obtained from this solvent as a dark red crystalline mass, containing no xylene, but still retaining 1 mol. of water. The *diacetyl* compound crystallises in colourless prisms, m. pt. 205° C. It is soluble in dilute alcoholic hydrochloric acid, and the solution but faintly dyes tannin-mordanted cotton.

The authors describe as *Apo-rhodamines* the mono-amino derivatives of fluorane, because of their analogy with the Aposafranines. The apo-rhodamine

was prepared by heating dimethyl-*m*-aminohydroxy-benzoylbenzoic acid and *p*-cresol with concentrated sulphuric acid. The free base $C_{23}H_{19}O_3N$ dissolves in ether, alcohol, benzene, &c., without coloration, and is obtained in large flat colourless needles, m.pt. 197° C. From xylene it is obtained in colourless crystals which contain $\frac{1}{2}$ mol. of xylene. No coloured aporhodamine bases could be prepared.

The shades produced by the above substances vary from a very bluish to a very yellowish red. The bluest shade is that of the tetra-ethyl compound, then that of the tetramethyl and diethylhomo-compounds. *Symm.-diethylrhodamine* follows next, then the acetyl-derivative of homo-rhodamine and finally apo-rhodamine, which gives an exceedingly yellow tone. All produce red shades with 1 per cent. on tannin-mordanted cotton; but apo-rhodamine has very little affinity for silk. The tetra-ethyl compound (Rhodamine B) is alone of technical value; the tetramethyl compound is less soluble and is scarcely used. Diethylhomo-rhodamine and *symm.-diethylrhodamine* are too high (y basic to be of use, but in the form of their esters (Irisamine and Rhodamine 6G) have attained great importance.—H. L.

Aminonaphthacridines; Syntheses of —. F. Ullmann and E. Bühler. *Z. Farben- u. Text.-Ind.*, 1905, **4**, 521–522.

THE aminonaphthacridine

may be produced by heating together *m*-toluylenediamine, β -naphthol and sulphur. (See J. R. Geigy, Ger. Pat. 130,360.) The authors find that the yield so obtained is small; and that the same aminonaphthacridine is formed on heating dihydroxydinaphthyl sulphide or dihydroxydinaphthylmethane with *m*-toluylenediamine and by condensing *m*-phenylenediamine and β -naphthol with formaldehyde.

The best yield 1.6 grms. (24.4 per cent.) of pure aminonaphthacridine was obtained by melting together 4 grms. of β -naphthol, 3 grms. of *m*-phenylenediamine and 2 grms. of trioxymethylene, and then quickly distilling the raw product.

A recipe for preparing dihydroxydinaphthyl sulphide with a yield equal to 88 per cent. of the theoretical is also given.—H. L.

Phenosafranines: Symmetrical and Unsymmetrical —. P. Barbier and P. Sisley. *Bull. Soc. Chem.*, 1905, **33**, 1190–1198.

By repeatedly crystallising commercial Phenosafranine from dilute hydrochloric acid (20 c.c. per litre), two isomeric hydrochlorides are obtained; the less soluble of these is the unsymmetrical Phenosafranine. Symmetrical phenosafranine is easily obtained by oxidising a mixture of equal molecules of *p-p*-diaminodiphenylamino and aniline. The constitution of this

follows from the method of preparation. The unsymmetrical isomeride (preponderating in the commercial dyestuff) which has the constitution

arises from an internal transposition (similar to that of diazoaminobenzene into aminoazobenzene) of the azine compound formed by the oxidation of the mixture of *p*-phenylenediamine with aniline. The symmetrical and unsymmetrical isomerides are designated *Indo*- and *Azophenosafranine* respectively, on account of their derivation. The following are the chief points of difference:—The hydrochloride of the symmetrical isomeride crystallises with 1.5 mol., and that of the unsymmetrical with 3 mols. of water. The hydrochloride of the symmetrical variety is much less soluble in water and sodium chloride solution than that of the unsymmetrical variety. Indophenosafranine is more soluble in water and less soluble in alcohol than Azophenosafranine. The tinctorial properties of the two isomerides are somewhat similar, the shade produced by the symmetrical isomeride being the more bluish of the two, at the same time the symmetrical Phenosafranine baths are more completely spent, and the dyeings are a little faster to washing than those of the unsymmetrical variety. The diazotisation of Indophenosafranine is more rapid and more complete than that of its isomeride. (See also this J., 1888, 31 and 116.)—T. F. B.

Azoxonium Compounds. F. Kohnmann, Ber., 1905, 38, 3604—3607.

2-HYDROXY-1,4-PHENYLENEDIAMINE was condensed with various *o*-quinones. With phenanthraquinone a violet dyestuff was obtained to which the author assigns the formula

With 4-amino-1,2-naphthoquinone a bluish violet dyestuff,

is obtained, and may be looked upon as the mother-substance from which Nile Blue, New Methylene Blue G.G., the Cyanamines and other blue oxazine dyestuffs are derived. This body forms fluorescent solutions, and dyes cotton mordanted with tannin in bluish-violet shades, distinctly redder than those produced by Methyl Violet, fast to soap and moderately fast to light. A black, insoluble by-product is also formed. By the action of 4-anilino- β -naphthoquinone a greenish-blue phenyl derivative of the dyestuff described above is obtained.

—E. F.

Fisetin; Synthesis of — S. v. Kostanecki and S. Nitkowski, Ber., 1905, 38, 3587—3589.

IN the former synthesis of fisetin the monoethyl ether of resacetophenone was used, as resacetophenone was more readily though partially alkylated by ethyl bromide than by methyl iodide. The monomethyl ether ("Paeonol") is, however, readily obtained from resacetophenone by means of dimethyl sulphate. By the action of Paeonol on veratric aldehyde, 2'-hydroxy-4,3,4'-trimethoxychalcone, $\text{CH}_3\text{O} \cdot \text{C}_6\text{H}_3(\text{OH}) \cdot \text{CO} \cdot \text{CH} : \text{CH} \cdot \text{C}_6\text{H}_3(\text{OCH}_3)_2$, is obtained. On boiling with alcohol and strong hydrochloric acid, this forms 3,3',4'-trimethoxyflavanone,

By treatment with amyl nitrite and hydrochloric acid this is converted into its α -isonitroso derivative which dyes in yellow shades on cobalt mordant. On boiling with glacial acetic acid and dilute sulphuric acid this forms 3,3',4'-trimethoxyflavanol which dyes in yellow shades

on alumina mordant. On boiling with hydrochloric acid this yields fisetin, 3,3',4'-trihydroxyflavanol.

E. F.

Cyanine Dyestuffs; Constitution of — G. Book, Ber., 1905, 38, 3804—3806.

THE author maintains that the formation of a blue dyestuff by the action of alkali on α - γ -dimethylquinolinium salts does not (as stated in Photogr. Corr., 1905, 135; Chem. Centr., 1905, 1, 1561) in any way affect the correctness of Book and Mische's formula for Cyanine dyestuffs (Ber., 1904, 37, 2008, 2821; see this J., 1904, 712, 862). He shows that the dyestuff in the above instance is not formed immediately, but only after atmospheric oxidation of the alkaline solution has taken place. True Cyanine dyestuffs are directly formed in the absence of air; and the substance obtained from α - γ -dimethylquinolinium salts probably belongs to an entirely different series.—H. L.

ENGLISH PATENTS.

Dyestuffs; Manufacture of New Nitroso Bodies and Blue — the *re* from. R. B. Rindford, Upper Norwood, From L. Gessella and Co., Frankfurt a. Main, Germany. Eng. Pat. 25,998, Nov. 29, 1904.

p-AMINODIPHENYLAMINE or its sulphonic acid is acetylated by boiling with glacial acetic acid. The acetyl compound is then converted into a *p*-nitroso body

or its sulphonic acid ($\text{NH} \cdot \text{CO} \cdot \text{CH}_3 : \text{SO}_3\text{H} : 1 : 3$) by treatment with sodium nitrite in the presence of alcoholic hydrochloric acid. These nitroso compounds may be condensed with the sulphonic acids of diaphyl-1,3-naphthylenediamine and the new dyestuffs are obtained by the hydrolysis of the reaction products either directly or after previous sulphonation. The preparation of two dyestuffs is described.

(1) 30 kilos. of *p*-nitroso-*p*-acetamidodiphenylamine are introduced at about 60° C. into a solution of 40 kilos. of diphenyl-1,3-naphthylenediamine-7-sulphonic acid, 12 kilos. of caustic soda, 40° B., and 100 litres of alcohol, 20 kilos. of 50 per cent. acetic acid are then added and the whole heated to the boil for three hours. On cooling, the condensation product separates out in crystals. This is dried and powdered; then sulphonated at 80° C. with 5 parts of sulphuric acid monohydrate. The product is diluted with water, and hydrolysed by boiling for seven to eight hours. The product thus prepared dyes wool indigo blue shades stated to be fast to milling and light.

(2) 55 kilos. *p*-nitroso-*p*-acetamidodiphenylamine-*o*-sulphonic acid are condensed in an analogous manner with 51.4 kilos. of diphenyl-1,3-naphthylenediamine-6,8-disulphonic acid. The product is then hydrolysed with hydrochloric acid, and a dyestuff is obtained which is soluble without further sulphonation. It is said to dye wool in bright greenish-blue shade, and to possess most excellent levelling properties, fastness to light and washing.

Similar dyestuffs are obtained from the corresponding ditolyl compounds.—H. L.

***o*-Nitro-derivatives and *o*-Amino-derivatives of certain Aromatic Bases; Manufacture of** — C. D. Abel, London. From Act.-Ges. f. Anilinfabr., Berlin. Eng. Pat. 27,497, Dec. 16, 1904.

ARYSULPHAMIDES of the aromatic series, which are substituted in the para position to the arylsulphamido-group, are treated with dilute nitric acid, with or without the addition of a suitable solvent. *o*-Nitro-derivatives of the arylsulphamides are thus obtained. If these substances are treated with concentrated sulphuric acid, the arylsulphonic residue is eliminated, with formation of the free *o*-nitro-amino bodies. If they are reduced before hydrolysis, the corresponding *o*-diamines are formed.

Example 1. A mixture of 282 parts of *p*-toluenesulpho-*p*-chloroanilide, $\text{CH}_3 \cdot \text{C}_6\text{H}_4 \cdot \text{SO}_2 \cdot \text{NH} \cdot \text{C}_6\text{H}_4 \cdot \text{Cl}$, with 1000 parts of water and 422 parts of dilute nitric acid (sp. gr. 1.18) are heated to about 90° C. for three hours with

good stirring. After cooling, the new product is filtered off, washed and dried. On recrystallisation from alcohol, small yellow needles, m. pt. 110° C., of the *o*-nitro-product $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_2\text{NH.C}_6\text{H}_3(\text{NO}_2)\text{Cl}$ [$\text{NH}.\text{NO}_2.\text{Cl}=1:2:4$] are obtained. The following analogous derivatives, in all of which the nitro group in the ortho and the other substituting group in the para position to the sulphamino group, are also characterised:—

$\text{C}_6\text{H}_5\text{SO}_2\text{NH.C}_6\text{H}_3(\text{NO}_2)\text{CH}_3$, m. pt. 89° C.; $\text{C}_6\text{H}_5\text{SO}_2\text{NH.C}_6\text{H}_3(\text{NO}_2)\text{OC}_2\text{H}_5$, m. pt. 72° C.; $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_2\text{NH.C}_6\text{H}_3(\text{NO}_2)\text{CH}_3$, m. pt. 98° C.; $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_2\text{N}(\text{C}_2\text{H}_5)_2\text{C}_6\text{H}_3\text{NO}_2\text{CH}_3$, m. pt. 127° C.; (1) $\text{NO}_2\text{C}_{10}\text{H}_6\text{NH.C}_6\text{H}_3\text{SO}_2\text{C}_6\text{H}_3(2)$, m. pt. 156° C.; (1) $\text{NO}_2\text{C}_{10}\text{H}_6\text{NH.SO}_2\text{C}_6\text{H}_3\text{CH}_3(2)$, m. pt. 159° C.

Example 2: *o*-nitro-*p*-toluidine ($\text{NH}_2:\text{NO}_2:\text{CH}_3=1:2:4$) is prepared by dissolving *o*-nitro-*p*-toluenesulpho-*p*-toluidide m.pt. 98° C. (see above) in three parts of concentrated sulphuric acid at the ordinary temperature, pouring the solution on to ice, and neutralising with sodium carbonate.

The new process is stated to be very suitable for the manufacture on a commercial scale because the yields obtained on nitration are nearly the theoretical, and because only one nitro group enters the benzene or naphthalene nucleus and always occupies the *o*-position to the amino group. The *o*-nitroarylsulphamino-, *o*-nitroamino- and *o*-diamino-derivatives produced are all stated to be suitable for the manufacture of dyestuffs. (Compare also Eng. Pat. 6741 of 1904; this J., 1905, 193.) —H. L.

5-Nitro-2-Aminophenol; Improved Manufacture of —. C. D. Abel, London. From Act.-Ges. f. Anilinfabr., Berlin. Eng. Pat. 7910, April 12, 1905.

THE ethenyl derivative of *o*-aminophenol

(see Ladenburg, Ber., 1876, 9, 1524) is nitrated in the cold with a mixture of nitric acid (40° B.) and sulphuric acid monohydrate in equal parts, and the nitroethenyl compound obtained is decomposed by treating with warm concentrated hydrochloric or any other suitable acid. The product is stated to be identical with the 5-nitro-2-aminophenol obtained on nitration of diacetyl-*o*-aminophenol.—H. L.

Dyestuffs Derived from 5-Nitro-2-Aminophenol; Manufacture of Azo —. C. D. Abel, London. From Act.-Ges. f. Anilinfabr., Berlin. Eng. Pat. 7910a., April 13, 1905.

THE dyestuffs claimed are prepared by combining 5-nitro-2-aminophenol, diazotised in the usual way, with a naphthol- or an aminonaphtholsulphonic acid. Thus 2,3-aminonaphthol-6-sulphonic acid in alkaline solution yields a product which dyes chromed wool in blue-black shades, stated to be of remarkable fastness. It may also be dyed on wool from an acid bath and afterwards treated with chrome. The dyestuff prepared from 1,5-aminonaphthol-3,7-disulphonic acid dyes wool from an acid bath in dull Bordeaux shades, which on chroming turn to a greenish-black fast to milling. The combination with 1,5-naphtholsulphonic acid yields a dyestuff, of which the after-chromed dyeings are blue-black.—H. L.

Dyestuffs; Manufacture of New Anthracene —. H. E. Newton, London. From Farbenfabr. vorm. F. Bayer and Co., Elberfeld, Germany. Eng. Pat. 9138, May 1, 1905.

SEE Fr. Pat. 354,076 of 1905; this J., 1905, 1061.—T.F.B.

Colouring Matter of the Anthracene Series [Anthracene Dyestuff]; Manufacture of a —. J. Y. Johnson, London. From the Badische Anilin und Soda Fabrik, Ludwigshafen, Germany. Eng. Pat. 17,242, Aug. 25, 1905.

A CHLOROINDANTHRENE, crystallising in green needles, is prepared by treating indanthrene with antimony pentachloride in the presence of a suitable solvent such as nitrobenzene. The new product is similar to the halogen

indanthrenes described in Eng. Pats. 4035 of 1902 and 23,179 of 1903 (see this J., 1903, 22 and 1904, 898), but is said to produce shades still faster to chlorine.—H. L.

Anthraquinone Derivatives; Manufacture of New —. Badische Anilin und Soda Fabrik, Ludwigshafen-on-Rhine, Germany. Eng. Pat. 19,200, Sept. 22, 1905. Under Int. Conv., April 3, 1905.

New dianthraquinonylamines are produced by condensing an acylated 1-amino-4-halogenanthraquinone or a derivative thereof with 1-aminoanthraquinone or a derivative thereof, and then hydrolysing to eliminate the acetyl group. The reaction is best carried out in the presence of a diluent such as nitrobenzene or naphthalene. Cuprous or cupric chloride and sodium acetate or another copper salt are suitable condensing agents. The condensation of 1-acetamino-2-methyl-4-chloroanthraquinone with 1-amino-2-methylanthraquinone and also with 1-amino-2-methyl-4-*p*-toluidanthraquinone is described in detail. Derivatives such as acetyl-1,5-diamino-2,4,6,8-tetrachloroanthraquinone may be used instead of acetyl-1-amino-2-methylanthraquinone.—H. L.

Indigo White; Production of Halogenated —. J. Y. Johnson, London. From Badische Anilin und Soda Fabrik, Ludwigshafen-on-Rhine, Germany. Eng. Pat. 21,746, Oct. 25, 1905.

HALOGENATED indigo is reduced by treatment with a solution of indigo white, preferably in the presence of caustic soda. Indigo is precipitated, and, after filtration, a solution of halogenated indigo-white is obtained which may be directly used for dyeing. The reagents usually employed for reducing indigo remove the halogen from halogenated indigo to some extent, and produce, it is said, a mixture of halogenated and ordinary indigo white. The object of the present invention is to obviate this difficulty. —H. L.

GERMAN PATENTS.

Chloro- and Bromophthalimide; Process for Preparing —. Badische Anilin und Soda Fabrik. Ger. Pat. 161,340, April 16, 1902.

HYPOCHLOROUS or hypobromous acid acts on phthalimide in aqueous suspension, in the cold, producing the corresponding halogen derivative.—T. F. B.

Monoalkylaminohydroxybenzoylbenzoic Acid; Process of Preparing —. Badische Anilin und Soda Fabrik. Ger. Pat. 162,034, Nov. 15, 1903.

THE benzoylbenzoic acid derivative of monoalkyl-aminophenol is obtained by heating molecular proportions of the alkylaminophenol and phthalimide in presence of boric acid, and saponifying the resulting acid amide. The amide is stated to possess the characters of a basic dyestuff, dyeing brownish-yellow shades on cotton treated

with tannin. The acid is suitable for use in preparing Rhodamines, by condensation with *m*-aminophenol.

—T. F. B.

Nitroacetyldiaminophenol ($\text{OH} : \text{NO}_2 : \text{NHCOCH}_3 : \text{NH}_2 = 1 : 4 : 2 : 6$); *Process for Preparing* — L. Cassella and Co. Ger. Pat. 161,341, Oct. 14, 1903.

By reducing acetylpicramic acid with aqueous alkali sulphide, 2-acetamino-4-nitro-6-aminophenol is obtained. It is stated to be of value in the production of dyestuffs susceptible to chroming. Other reducing agents act also on the second nitro-group — T. F. B.

Indophenols; Method of Preparing — Act.-Ges. f. Anilinfabr. Ger. Pat. 160,710, Jan. 16, 1904.

The arylsulpho-*p*-phenylenediamines, obtained by reducing the nitro-arylsulphamides described in Eng. Pat. 6741 of 1904 (see this J., 1905, 193) are oxidised together with a phenol having the *p*-position free. The oxidation proceeds satisfactorily by using sodium hypochlorite in alkaline solution. The resulting indophenols are stated to be very stable, and to be suitable for the preparation of dyestuffs. — T. F. B.

1-Methyl-2-naphthol; Process of Preparing — Farbwerke vorm. Meister, Lucius und Brüning. Ger. Pat. 161,450, Aug. 21, 1904.

"DINAPHTHOLMETHANE," obtained by condensing formaldehyde with β -naphthol, can be reduced to a mixture of β -naphthol and 1-methyl-2-naphthol. If this mixture is allowed with formaldehyde, a further quantity of the dinaphtholmethane is formed; the solution is precipitated by hydrochloric acid, and the methyl-naphthol removed by washing the precipitate with water. It is a crystalline substance of m. pt. 112°C ., easily soluble in alcohol, ether and benzene. — T. F. B.

V.—PREPARING, BLEACHING, DYEING, PRINTING, AND FINISHING TEXTILES, YARNS, AND FIBRES.

(Continued from page 1227.)

Vegetable Flosses or "Silk-Cottons"; Indium — Bull. Imp. Inst., 1905, 3, 221—225.

Two samples of floss from *Cochlospermum Gossypium* and one from *Calotropis gigantea*, all of Indian origin, were examined. The *Cochlospermum* flosses were inferior as regards colour, freedom from seeds, softness and resiliency to the *Calotropis* floss, which was comparable in quality with "kapok," the floss of *Eriodendron anfractuosum*. The *Cochlospermum* flosses yielded only about 46 per cent. of cellulose, whereas the *Calotropis* floss yielded 64.3 per cent., equal to the yield of cellulose from "Kapok." The Javanese "kapok" is superior to the Indian "kapok" in softness and resiliency, owing probably to unsuitable methods employed for freeing the latter from seeds and to excessive pressure in packing. Javanese "kapok" finds a considerable sale in Europe, and is used chiefly for stuffing cushions, bedding, &c. It is characterised by an extreme resistance to wetting by water, and has therefore been employed in the form of mattresses on ships, its buoyancy being such as to enable the mattresses to serve as temporary rafts. The problem of spinning the floss for commercial textile purposes has not yet been satisfactorily solved. In view of the inferior quality of the Indian flosses, the market rates would be lower than that obtainable for the Javanese material. — J. F. B.

Musa Fibres from East Africa. Bull. Imp. Inst., 1905, 3, 226—228.

Two species of *Musa*, *M. Ensete* and *M. ulugurensis*—are cultivated in German East Africa for the sake of their fibres. These fibres, though inferior to real Manila hemp (*M. textilis*) are of very good quality. The plants can only be cultivated from seed, and the yield of fibre from *M. ulugurensis* is rather small, but these drawbacks are

largely compensated for by the more rapid growth and by other factors. Two samples of *M. Ensete* were examined; the first-quality fibre was nearly white and had a lustrous appearance, good strength, and a length of 5½ ft. 6 in. The second quality was darker in colour and slightly inferior in strength; its length was 4 ft. 11 in. The fibre of *M. ulugurensis* was similar in appearance, but less lustrous and harsher to the touch. The following analytical data are recorded:—

	<i>Musa Ensete</i>		<i>Musa ulugurensis</i>
	1st Quality.	2nd Quality.	
Moisture	Per cent. 9.7	Per cent. 9.4	Per cent. 10.2

ENGLISH PATENTS.

Silk; New Artificial — H. E. Newton, London. From Farbenfabriken vorm. F. Bayer und Co., Elberfeld, Germany. Eng. Pat. 28,733, Dec. 29, 1904.

A 15 per cent. solution of triacetylcellulose, prepared according to Eng. Pat. 21,628 of 1901 (this J., 1902, 1293) in chloroform, is forced through a capillary tube into a room or space, the atmosphere of which is heated to about the temperature at which the solvent boils. The triacetylcellulose solidifies on coming in contact with the hot air and forms a thread which can be directly drawn and wound, without passing through a coagulating bath. The new artificial silk thus obtained is stated to possess great brilliancy, tensile strength and suppleness; to resist water, alkalis and acids; and to be less inflammable than the collodion product. The claims embrace this substance as a new article of manufacture; the above process for its preparation or any other in use for the manufacture of artificial silk. — H. L.

Peat-Fibre; Method of Treating —. M. Forgeot. Fr. Pat. 355,928, July 5, 1905.

In order to convert peat-fibre into a textile product, the peat, after suitable preliminary treatment, is placed in bundles on a grating and immersed in a hot solution of soft soap. It is then rinsed by means of jets of water at high pressure to completely remove soap, and also to free the material from part of the gum and from incrustations loosened by the first washing. The material is then immersed in a degumming bath, consisting of cold acetic acid, in which it is moved to and fro. The fibrous peat is then dried, the liquid being run off in such a manner that the fibres all lie in a parallel position, as though they had been combed.—E. F.

Cellulose Threads; Manufacture of Brilliant —. Soc. Gen. de la Soie Artificielle Linkmeyer. Soc. Anon. Fr. Pat. 356,402, July 25, 1905. Under Int. Conv., Aug. 26, 1904.

SEE Eng. Pat. 4761 of 1905; this J., 1905, 671.—T. F. B.

Threads [Casein] for Use as Silk, Horschair and Fabrics; Process for Making Artificial —. F. Todtenhaupt. Fr. Pat. 356,404, July 25, 1905.

Wool and Half-Wool on Bobbins; Method of Treating — for the Purposes of Dyeing, Bleaching, Degreasing and Impregnating. H. Giesler. Fr. Pat. 355,753, June 29, 1905. Under Int. Conv., June 3, 1905.

It is not possible to dye wool and half-wool on the ordinary perforated sheet-iron bobbins employed in the case of cotton, since acid liquids must be used, and these would attack the iron; also wool and half-wool cannot be satisfactorily wound on to a metal bobbin and would deteriorate by storage in contact with the metal. According to the present invention, the wool or half-wool is wound on to the usual paper bobbins, which are then fixed into a wooden block and the bobbin and wool, or half-wool, dried. The paper bobbin can now be removed by means of a wooden implement without disturbing the fibre surrounding it. A perforated bobbin of metal, or of other material resistant to the chemicals to be used, is now inserted and the yarn is dyed, bleached or otherwise treated by forcing the necessary liquids through.

—E. F.

Shaded Effects on Dyed Fabrics; Method of Producing —. Rheinische Webstuhl- und Appreturmaschinenfabrik, G.m.b.H. Fr. Pat. 355,887, July 5, 1905. Under Int. Conv., Jan. 6, 1905.

THE fabric, 2, is suspended from one selvage above the vat, 14, being either folded lengthwise (see Fig. 2) or wound into a spiral (Fig. 1). It is then slowly and regularly immersed in the dye-vat, and finally quickly raised out of the liquid. By this means, the lower selvage of the fabric being immersed for the longest period, is most deeply dyed, and the shade diminishes uniformly in intensity towards the upper selvage. If the piece be required dyed

FIG. 1.

FIG. 2.

deeply in the centre, shading off towards both selvages, it is folded along its whole length, suspended from the two selvages, and the process continued as described above. Analogously other and similar effects may be obtained. An apparatus for carrying out the process is described. The fabric is suspended from a frame, 6, which may be mounted on a spindle, 7, connected with a hydraulic plunger. This plunger is allowed to slowly fall during dyeing, by allowing the water in the cylinder to slowly flow out, and the fabric is thus gradually immersed in the dye-vat, 14. Water is then quickly admitted into the cylinder, causing the plunger to rise rapidly, carrying the fabric with it. The fabric is kept stretched during these operations by the weight of a second frame attached below.—E. F.

Printing; Revolving Brushes for — [Utilisation of Waste from Photographic Films]. Soc. Anon. des Plaques et Papiers Photographiques, A. Lumière et ses fils. Fr. Pat. 350,187, Sept. 24, 1904.

REVOLVING brushes used in printing textile fabrics are usually covered with horse-hair or other similar material. According to the present patent this may be advantageously replaced by long narrow strips cut from photographic films made from nitrocellulose. The waste clippings from film manufacture may be usefully employed in this manner.—E. F.

Hydrosulphurous Acid and another Acid; Preparation and Utilisation of Double Salts of —. J. Harding. Fr. Pat. 350,189, Sept. 24, 1904. VII., page 1303.

Aldehydic Derivatives. Production of —, and their Application as Discharging Agents. Badische Anilin und Soda Fabrik. Second Addition, dated June 24, 1905, to Fr. Pat. 350,607, Jan. 7, 1905.

THE original patent (this J., 1905, 727) described methods of preparing salts of formaldehyde-sulphoxylic acid. According to the present addition, salts of aldehyde-sulphoxylic acids may be prepared by the action of zinc,

in the absence of free mineral acids, on aldehyde-sulphurous or aldehyde-hydrosulphurous acids, their zinc or ammonium salts. Instead of the prepared aldehyde-sulphurous or aldehyde-hydrosulphurous acids, equimolecular quantities of an aldehyde and sulphurous acid, or of an aldehyde and a zinc, ammonium, or alkali hydrosulphite, neutral sulphite or bisulphite may be used. The zinc may also be replaced by other reducing metals, of which iron has been found the most suitable. In all these cases heat is finally applied in order to complete the reaction. The zinc aldehyde-sulphoxylates are not very soluble and may be converted into more soluble alkali salts by double decomposition with an alkali sulphite, or other alkali salt which precipitates zinc, or an alkali hydroxide. In the case where formaldehyde, an alkali bisulphite and zinc are used, the reaction takes place according to the equation:—

More than 80 per cent. of bisulphite may thus be converted into sulphoxylate. If the sodium bisulphite be replaced by zinc bisulphite, the latter is completely converted into aldehyde-sulphoxylate. Example: 540 kilos. of zinc bisulphite of 25° B., 75 kilos. of 40 per cent. formaldehyde, 2000 litres of water and 120 kilos. of zinc dust are boiled together for two to three hours. The resultant liquid, containing zinc formaldehyde-sulphoxylate, is then treated with sodium carbonate or sulphide, filtered from zinc compounds and concentrated *in vacuo*. Solid sodium formaldehyde-sulphoxylate is so obtained which has lost part of its water of crystallisation and contains 91 per cent. of $(\text{NaHSO}_2 + \text{CH}_2\text{O})$.—E. F.

Chamber Process; Use of the Fan in the ——. G. Schliebs. Z. angew. Chem., 1905, 18, 1900—1902.

THE source of draught in the chamber process is immaterial, provided there is a sufficiency; to secure this with "natural" draught, requires careful attention to the dimensions of all the details of the system, which must be so arranged that the difference in pressure between the two ends of the system does not exceed a few millimetres of water column. If this cannot be achieved (which is particularly the case when complicated dust-chambers and filters, or highly resisting plate towers are introduced) recourse must be had to artificial draught. The three places where a fan may be introduced are: 1. Between the burners and the Glover tower; 2. Immediately before or between the Gay Lussac towers; 3. Between the Glover tower and the first chamber. Falding has reported favourable results from a fan in the first position, and the author has found it to answer well, provided the temperature was high enough to prevent condensation of arsenious oxide; if that happened, however, troublesome and

disturbing cleanings were necessary. A disadvantage of this position is that the volume of gas to be dealt with by the fan is greater than in the second position. The author considers the second position the least favourable. He quotes the case of two works. One, with excellent natural draught, was making 6·7 kilos. of chamber acid per cb. m. per day, and burning 54 kilos. of pyrites per sq. m. in the burners. A fan was introduced at the end of the system, but no increase of production or lessening of nitre-consumption ensued, so the fan was taken out again. The second system had a fan in position 3, and one in position 2, and worked excellently; when that in position 2 was used alone, the production sank by 20 per cent., and the nitre-consumption increased by 30—40 per cent., but when that in position 3 was used alone, and a damper built in the place of the other fan, the production rose to the normal, and the nitre-consumption even fell below that with two fans. The second fan was taken out, and did excellent work in another system in position 3. This position, the author considers, is the best; the draught in the burners, dust chambers, and Glover tower can be regulated at will, and either *plus* or *minus* pressure can be established in the chambers as the draught is regulated by the fan, or by the end damper. The author has never discovered any difference, however, in the working of chambers, due to *plus* or *minus* pressure existing in them. Hard lead is the best material for fans, and if the fan be properly worked, and not driven at too high a speed, there is but little corrosion.

The author had experience of a work in which the arrangement described by Lütty (this J., 1905, 921) was introduced. No increase in production resulted however, and the arrangement had the disadvantage of lessened concentration in the Glover. High production depends not only on the ventilation, but on the form of the chambers and the removal of the surplus heat of reaction. Falding's tangential system in Baltimore, working without fan, plate-towers, or spray, yielded 10 kilos. of chamber acid per cb. m. Lütty claims that a fan at the end of the system is rapidly destroyed, but that the introduction of a plate-tower immediately before it greatly prolongs its life; the author worked with one in this position, without a tower, for five years, and it was then removed to position 3 in another system, where it still continues to work. Lütty also says that water-spray works best in high chambers, but gives no figures to support the statement; the author has had experience of it in three systems, in which the heights are respectively 12·8, 7·0, and 5·0 m.; in all it has worked well, but has given the best results in the last.—J. T. D.

Nitrification; Intensive ——. A. Müntz and E. Lainé. Comptes rend., 1905, 141, 861—867.

THE authors have investigated the nitrification of ammonium salts. They find that granulated animal charcoal forms a better soil for the nitrifying organisms than coke breeze; the highest yield of nitrate being obtained from a solution of ammonium sulphate containing 7½ grms. per litre. At 30° C., 10 cb. decm. of charcoal were found capable of nitrifying, practically completely, 960 c.c. of this solution daily. The cost of evaporating the dilute solution of nitre so obtained, however, is very considerable, and the authors are investigating the possibility of passing the same liquid several times through the nitrifying beds, each time dissolving in it fresh ammonium sulphate.

They have also experimented with natural soils, kept in a constant condition of moisture, and at temperatures of 15°—22° C., and dug or stirred from time to time. Vegetable moulds and composts, watered with solutions of 1—2 grms. of ammonium sulphate per litre, thus gave 0·350—0·630 grm. of nitrates per kilo. per day, or on a field of 1 hectare, in a layer 50 cm. deep, 650 to 1200 tons per annum. This formation of nitre will go on in the same soil when watered with fresh portions of ammonium salt, to an extent the limit of which the authors have not yet reached, though they have produced soils containing 27—33 grms. of nitre per kilo. The water in these soils must have contained 55—157 grms. per litre. Methodical lixiviation of these soils would yield a solution from which the nitre could be recovered at comparatively small cost;

and in the event of war, nitrates could in this way be produced in quantities commensurate with military requirements.—J. T. D.

Ammonium Salts; Decomposition of—by Hot Sulphuric Acid in presence of Platinum. M. Delcigne. *Comptes rend.*, 1905, **141**, 886–889.

TROUBLED by losses of nitrogen when spongy platinum is added to prevent bumping in the Kjeldahl process, the author has investigated the question, and finds that when ammonium sulphate is heated with sulphuric acid and spongy platinum added, there is a steady evolution of nitrogen and of sulphur dioxide, the more rapid as the temperature is higher. With 30 c.c. of strong sulphuric acid, 20 grms. of potassium sulphate and 30 grms. of ammonium sulphate, to which 0.03 grm. of spongy platinum was added, the loss of nitrogen in an hour was 8 mgrms. The cause of this may be either the decomposition of the sulphuric acid, aided catalytically by the platinum, at the high temperature ($\text{H}_2\text{SO}_4 = \text{H}_2\text{O} + \text{SO}_2 + \text{O}$), and the reaction of the oxygen on the ammonium compound; or the attack of the platinum by the sulphuric acid, and reaction of the sulphate on the ammonium salt:—

The second is the true explanation: sulphuric acid does attack and dissolve platinum sponge when heated with it. Moreover, spongy gold or iridium, which are not attacked by sulphuric acid, do not cause a loss of nitrogen from ammonium salts in the same way as spongy platinum. —J. T. D.

Sodium Hydrosulphite; Contribution to the Knowledge of—, A. Binz and W. Sondag. *Ber.*, 1905, **38**, 3830–3834.

FOR the analysis of the sodium hydrosulphite used in the experiments, the following procedure was adopted and proved very satisfactory:—

Hydrosulphite.—0.3005 grm. was titrated, in an atmosphere of carbon dioxide, with a solution of potassium ferricyanide (80 grms. per litre; 1 c.c. = 0.2114 grm. of sodium hydrosulphite). (See Ekker, *Rec. trav. chim. Pays-Bas*, 1894, **13**, 36.)

Sulphate.—5.21 grms. were boiled with hydrochloric acid, with passage of a current of carbon dioxide, to expel sulphur dioxide, and in the filtered solution, the sulphuric acid was determined as barium sulphate.

Thiosulphate.—A solution of 20 grms. of the sample in 500 c.c. of a 1.7 per cent. solution of sodium hydroxide was shaken with air, till the liquid no longer had a reducing action on an acetic acid solution of Indigo Carmine. In 100 c.c. of the solution, neutralised with magnesium chloride, the thiosulphate was determined by Feld's method (this J., 1898, 1186).

Sulphite.—In another 10 c.c. of the oxidised solution, the thiosulphate was decomposed by means of mercuric chloride and the sulphite determined by Feld's method (*loc. cit.*). Since, however, in the atmospheric oxidation of hydrosulphites besides sulphite, a little sulphate is also formed (this J., 1903, 492), this latter must also be determined in a portion of the oxidised solution after expelling the sulphur dioxide. By adding together the results of these two determinations and subtracting the values for hydrosulphite and sulphate, the amount of sulphite was obtained. The specimen of hydrosulphite used in the experiments had been kept in an exsiccator over sulphuric acid since Dec., 1904, and its composition in the original condition, and, as used, is shown in the following table:—

Sulphur in the form of:	Dec., 1904.	Sept., 1905.
	Per cent.	Per cent.
Hydrosulphite	32.59	29.52
Sulphite	2.06	4.60
Thiosulphate	0.89	0.67
Sulphate	0.52	0.93

1.066 grms. of the hydrosulphite were heated to 57°–62° C. with 2.818 grms. of sodium thiosulphate, and 9 grms. of a 20 per cent. solution of sodium hydroxide for five hours with exclusion of air, and then after standing for twelve hours, the whole was made up to 100 c.c. with boiled water. In the solution the sulphate was determined by precipitation with barium chloride, and the sulphite, sulphide and thiosulphate by Feld's method (*loc. cit.*). The analytical results show that by the action of sodium thiosulphate on sodium hydrosulphite, the latter adds on one atom of sulphur in the sulphonyl portion of its molecule, and then decomposes into sulphide and sulphite, an unstable thiosulphite being formed as an intermediate product, just as in the reaction between sodium hydrosulphite and sodium polysulphide (this J., 1905, 800). The reactions may be expressed by the equations:—

Iron Pyrites; Preparing—for Desulphurisation. W. Wedge, Ardmore, Pa. U.S. Pat. 804,690, Nov. 14, 1905.

PYRITES "smalls" or "fines," composed in part of powder, are mixed with a binding agent, such as a metallic sulphate, ferrous sulphate being specified, and the mixture is granulated, and subjected to heat insufficient to expel sulphur from the pyrites; and is then heated with agitation upon the hearth of a desulphurising furnace. (See U.S. Pat. 757,531 of 1904; this J., 1904, 545.)—E. S.

Iron Pyrites Charge for Desulphurising Furnaces, and Method of Preparing same. W. Wedge, Ardmore, Pa. U.S. Pat. 804,691, Nov. 14, 1905.

PYRITES "fines" are mixed with a "binder" containing a sodium salt, such as sodium sulphate, and ferrous sulphate; or with iron oxide mixed with acid sodium sulphate; or with sodium sulphate and nitrate and ferrous sulphate. Or the "binder" may be produced by charging iron oxide into the nitre pot of sulphuric acid apparatus

containing a sodium salt and sulphuric acid. The pyrites mixture is then made into lumps, blocks, or briquettes.

—E. S.

Iron Pyrites; Treating ——. *for Desulphurisation*. W. Wedge, Ardmore, Pa. U.S. Pat. 804,785, Nov. 14, 1905.

PYRITES "fines" are prepared for desulphurisation by mixing them with a "binder" containing sodium nitrate, with or without ferrous sulphate.—E. S.

Hydrochloric Acid; Process of Making ——. W. E. Everette, Tacoma, Wash. U.S. Pat. 805,009, Nov. 21, 1905.

A Mixture of water, chlorine gas, and compressed air, with or without an alkali chloride, is brought to an intensely cold condition by liquid air, and whilst in this state, is caused to make impact against intensely heated silica, whereby, it is stated, "the nitrogen and oxygen are liberated, while the chlorine combines with a portion of the liberated hydrogen to form hydrochloric acid gas," which gas is dissolved in water for commercial use.—E. S.

Phosphorus; Process of Making Red ——. R. Schenek and P. Marquart, Assignors to The Firm of Chem. Fabr. Bettenhausen Marquart and Schulz, Bettenhausen-Cassel, Germany. U.S. Pat. 804,555, Nov. 14, 1905.

WHITE phosphorus is added to phosphorus tribromide, or to other good solvent of white phosphorus capable of acting catalytically, and free from all inert diluting solvent, and the mixture is heated to produce "bright red" phosphorus. (See also this J., 1903, 194, 1225.)—E. S.

FRENCH PATENTS.

Lime Kilns; Construction of ——. [*Application of the Carbon Dioxide in Sugar Manufacture*]. Soc. van Cauwelaert Frères et Cie. Fr. Pat. 356,172, July 17, 1905.

THE calcined lime falls into a receptacle at the lower part of the kiln, communicating by radial inclined channels, with side openings, furnished with doors, for the discharge of the lime. Other radial channels, intermediate with the former, are provided, each with a fireplace and door, from which air is admitted to the kiln above the level of the central receptacle. The dome to the kiln has a central hopper, for admission of the charge, and side openings into a channel for passage of carbon dioxide, which is either led to recipient, or is utilised directly for the carbonation of beetroot juice, this application of the invention in connection with sugar manufacture being specially named.

—E. S.

Sodium and Potassium Salts; Use of [the Ash of] Mangrove [Trees] for the Production of ——. V. Quaintenne. Fr. Pat. 339,255, Dec. 24, 1903.

THE ash from the burning of Mangrove trees growing in salt marshes is stated to be relatively rich in sodium salts; and that of those growing in marshes, where the water is soft, to be correspondingly rich in potassium salts, to recover and utilise which salts is, as stated in the claim, the object of the invention.—E. S.

Hydrosulphurous Acid and Another Acid; Preparation and Utilisation of Double Salts of ——. J. Harding. Fr. Pat. 350,189, Sept. 24, 1904.

THE compounds are obtained by acting with solutions of hydrosulphites on neutral salts in fine powder or concentrated solution either in theoretical proportion or in excess and allowing the products to crystallise. The formation of the double salts is favoured by physical means, such as cooling, or the addition of liquids miscible with water, or of any other substance which decreases the solubility of such compounds in the mother-liquor. Double salts of zinc hydrosulphite with ammonium and sodium chlorides, ammonium fluorides and sodium bromide may be obtained in this way. For example, to 1 litre of a solution of hydrosulphite obtained from zinc dust and sulphurous acid solution, 8 litres of which reduce 1 kilo. of indigotin, 50–100 grms. of ammonium chloride or fluoride are added. Crystals of the probable formula

$\text{ZnS}_2\text{O}_4 \cdot \text{NH}_4\text{Cl}$ or $\text{ZnS}_2\text{O}_4 \cdot \text{NH}_4\text{F}$, either anhydrous or hydrated, are formed, and may be obtained as a paste, as a dry solid or in fine powder. The products are remarkably stable in the air and at a high temperature. When dry, most of them are not decomposed by glacial acetic acid. Their applications are claimed in chemical operations for dyeing and printing, and also more particularly as reducing, decolorising and disintegrating agents in refining and purifying glycerin, sugars, tanning material, and food-stuffs.—E. F.

Chlorine; Employment of Gaseous Hydrochloric Acid for the Manufacture of ——. *by Electrolysis of its Solution Regenerated Continuously*. E. F. Côté and J. F. Febyre. Fr. Pat. 356,145, July 12, 1905. XIA., page 1312.

VIII.—GLASS, POTTERY, AND ENAMELS.

(Continued from page 1233.)

Clays; Emanations from ——. *during Firing*. A. Hopwood. Trans. Eng. Ceramic Soc., 1904–5, 31–41.

THE vegetation in the neighbourhood of clayware kilns has in many cases been seriously affected by the gaseous products of the kilns. In one case investigated, Ramann and Wislicenus (Tonind.-Zeit., 1902, 1251–1259) attributed this to the presence of fluorine in the clays burned, but many clays devoid of fluorine have, within the author's experience, caused destruction of vegetation. This paper deals with the results of the dry distillation, distillation in presence of the chief kiln gases, of 32 clays of known origin, and with the nature of sublimes and distillates obtained. During the firing of a clayware kiln, the following gaseous products have to be considered:—Nitrogen, oxygen, carbon dioxide, hydrogen, steam, carbon monoxide, ammonia, hydrocarbons, and sulphur compounds. The emanations depend upon the volatile constituents of the clay, the nature of the gas present, and the temperature employed. The clays experimented upon were:—

Ten Red Tile Clays.—Tunstall, 6; Ruabon, 2; Wetley Moor, 1; Longport, 1.

Four Red Brick Clays.—Burslem, 1; Hanley, 1; Tunstall, 1; Acreington, 1.

Ten Fireclays.—Ruabon, 3; Stourbridge, 2; Burslem, 1; Hanley, 1; Goldendale, 1; Tunstall, 1; Coatbridge, 1.

Two Stoneware Clays.—Burslem, 1; Ruabon, 1.

Three Ball Clays.—Newton Abbott, 1; Torrington, 1; Corfe Castle, 1.

Three China Clays.—St. Austell, 3.

The Wetley Moor, red brick, fire, stoneware and ball clays contained moderate or large amounts of organic matter. The dried clays yielded large amounts of water at 350° C. All were free from fluorides, nitrates, nitrites, and arsenates, but, with a few exceptions, contained varying amounts of phosphates, sulphates, sulphides, ammonia and chlorides.

All clays were found to give larger or smaller sublimes of ammonium salts on heating in a glass tube. The ball, stoneware, fire and red brick clays gave yellow, turbid, oily liquids, of pungent odour, and containing much organic matter, which were alkaline to litmus.

The products obtained on heating the clays, under different conditions, never contained sulphites, nitrates, nitrites, arsenates or fluorides, although sulphates, ammonia, chlorides, organic matter and sulphides, or free sulphur or free sulphuric acid, were always present. The emanations from clays heated in the presence of oxidising gases are generally acid, but under other conditions are alkaline, and free sulphuric acid is fortunately neutralised in many cases by the ammonia produced.

—W. C. H.

Clay; Note on an Efflux from Sugar ——. C. E. Ramsden. Trans. Eng. Ceramic Soc., 1904–5, 72–73.

THE efflux consisted of an opaque vesicular glass, reddish-brown to purple or black, the variation in colour probably being due to differences in the oven atmosphere. It

formed on the exterior of saggars made from a plastic ferruginous marl, often containing nodules of iron pyrites. In one instance, when fired in a muffle kiln at 1050° C., the efflux appeared as a clear yellow glass round a small cavity. The analysis of a sample was:—

Silica, 26.58; alumina, 34.89; total iron as ferric oxide, 24.41; lime, 2.30; magnesia, 1.52; alkalis, 10.30.

Another sample contained 7 per cent. of ferrous iron. The author concludes that the efflux is a mixture of ferrous silicate, alkali silicates with alumina and free ferric oxide, magnetic oxide and metallic iron.—W. C. H.

China; The Fluxing Effect of Bone in English ——. W. Jackson and A. D. Holdercroft. Trans. Eng. Ceramic Soc., 1904-5, 6-23.

The experiments described were made to determine the nature, and the amount, of the effect of bone in a china body.

The materials were weighed out dry, and ground together in a mortar. In some cases a "slip" was made, passed through a 120's sieve, and dried on a plaster bat until in a workable condition. In other cases the materials were passed through a 60's sieve dry, sufficient water added, and the mixture well kneaded. Small cones, similar to Seger cones, were made as test pieces, and these were set up on supports of the same composition as the cones, as pieces of saggars were in some cases affected by the mixtures. The cones were dried over a flame, and fired either in a Heinecke gas muffle furnace, working up to about 1350° C., or in a Fletcher's injector gas furnace (up to 1500° C.).

A mixture was made of equal parts of china clay and Cornish stone, and cones were made of some of this mixture with increasing percentages of bone. The softest contained about 17 per cent. of bone (and 41.5 of clay, and 41.5 of stone). The calculated molecular formula of this compound was: $\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 4\text{SiO}_2 \cdot \frac{1}{3}\text{P}_2\text{O}_5$.

A series of trials with whiting in place of bone, though they contained approximately the same percentages of lime, showed that the most fusible mixture was 60 per cent. of whiting, 20 per cent. of china clay, and 20 per cent. of Cornish stone, corresponding with the formula, $3\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 4\text{SiO}_2$. A similar test piece was made, but 17 per cent. of the whiting was replaced by bone, and the fusibility of this mixture showed that the composition of the mixture when saturated with lime up to 17 per cent., was such that it could still take up a further amount if presented in the free state, as it would be in whiting, but apparently could not displace the phosphoric acid.

From the above formula, it appears that the flux is unable to displace phosphoric acid from bone when the acidity of the mixture is below that represented by eight atoms of oxygen in the acid radical SiO_2 , to four atoms of oxygen in the bases, but can take up lime in the free state (e.g., from limestone) until the corresponding ratio is 8:6.

A series of trials was made with 50 per cent. of bone, and 50 per cent. of mixtures of china clay and Cornish stone; decrease of the proportion of the latter constituent was accompanied by increase of fusibility, and showed how the fusibility of a china body can be varied without altering the proportion of bone. By the addition of alumina to the least fusible mixture, it became fusible, and flint fluxed with the more fusible. A series of calcium aluminium silicates was compounded with an increase of one molecular part of silica in each member in ascending order from one to seven, and the most fusible was found to be $\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 4\text{SiO}_2$, which confirmed the results obtained by varying the amount of bone in a china body, the most fusible mixture obtained in that case corresponding with the formula given, neglecting the phosphoric acid.—W. C. H.

Pottery; Crystallisation in ——. J. W. Mellor. Trans. Eng. Ceramic Soc., 1904-5, 49-65.

This paper deals principally with the effect of temperature on crystallisation, and the distinction is drawn between the crystalline effect produced when crystals separate from a molten glaze, and when the glaze crystallises *en masse*. A *resumé* is given of the phenomena of solution,

such as eutectic mixtures, supersaturation, rate of cooling, &c.

Aventurine glaze is presumably due to iron oxide dissolved from the body by the glaze, and rejected again in the crystalline state on cooling. A thin glaze generally gives better results. The explanation of this may be: if crystallisation starts in the zone between the glaze and the body, it is possible that it may not have time to spread from below to the upper parts of the thick glaze; or the iron dissolved from the body may not have time to diffuse uniformly throughout the whole mass so that the upper parts are never saturated with iron oxide, or possibly not sufficient iron may be dissolved from the body to saturate the whole glaze.

The solvent action of the glaze on the body may be very vigorous at high temperatures, and enough may be dissolved to dilute the saturated crystallisable solution to an unsaturated, non-crystallisable solution. New combinations may be produced by the interaction of the substance in solution with the materials derived from the body. Again, essential constituents may be volatilised at higher temperatures and so impoverish the glaze.

It is important of course to know the composition of the crystals produced, in order to "feed up" the glaze with the necessary constituents. The analysis of one crystal for example, corresponded closely with the formula $2\text{ZnO} \cdot \text{SiO}_2$. Also characteristic stellate crystals were obtained from a glaze compounded from the formula:—

A glaze containing 0.5 per cent. of cobalt oxide, and 5 per cent. of titanium oxide, gave lanceolate "cobalt blue" crystals in a pale yellow glaze of titanium oxide. Sections through some lanceolate and stellate crystals showed that the "arms" consisted of a great number of "threads," which give a soft silk-like appearance to the crystals.

Crystalline compounds that separate from a glaze may at higher temperatures be resolved into non-crystallisable combinations, so that too high a temperature would be fatal to the development of the crystals required.

The separation of crystals usually ceases when the glaze has solidified, although the glaze itself slowly passes into a crystalline condition, or devitrifies. Matt glazes are those in which devitrification has been prevented. A diagram is given, illustrating the effect of temperature on the rate of crystallisation of hippuric acid, which increases to a maximum at about 100° C., and then again decreases.

In the discussion, A. Heath said he had made crystalline glazes of the formula:—

The titanium did not appear to dissolve when the mixture was fritted. It was fired first in a glost oven, then in an earthenware biscuit kiln, afterwards in a china biscuit kiln, and the best results were obtained in a Jasper oven, with a period of five weeks' cooling.—W. C. H.

Glazes; China and Earthenware ——. H. W. Edwards, W. Edwards, and S. T. Wilson. Trans. Eng. Ceramic Soc., 1904-5, 24-33.

This paper gives the record of experiments made to ascertain the influence of variation of composition on the properties of a glaze. Six trials were made of each glaze; two were fired in an ordinary earthenware glost oven, one in the hardest and the other in the easiest place; the other four were fired, one hard and one easy in two separate china glost ovens. The glazes were ground and passed through 140's lawn. A glaze was taken of the composition:—

Fritt.	Mill.	which corresponds to
100 Borax	420 Fritt	$\left. \begin{array}{l} 0.274\text{Al}_2\text{O}_3 \\ 3.2 \text{ SiO}_2 \\ 0.461\text{B}_2\text{O}_3 \end{array} \right\}$

36	420	208	60	45	0.387	0.549	0.063	0.26	2.107	0.429	1.49		

The variations in composition and the results are collected in the table.

From the results obtained the authors draw the following conclusions:—

(1) *Lime*.—From three earthenware trials it was evident that whiting must not be added raw to a glaze fired at a comparatively low temperature, but should be fritted. With the china trials, fired "two bars higher," the results were better.

(2) *Lead Oxide*.—This gives brilliancy, may be used within wide limits, and has a wide range of firing temperatures. In excess it gives a yellow colour, and softens the body.

(3) *Alumina*.—This plays an important part, and while it stiffens the glazes and raises the firing point, it prevents devitrification and gives brilliant glazes which are hard and durable.

(4) *Silica*.—By increasing the amount of silica the glaze is stiffened and made viscous. When in excess of a tri-silicate, it causes devitrification, unless neutralised by alumina, and when decreased below a di-silicate, the glaze "crazes."

(5) *Boric Acid* may replace silica to a certain extent, and thus lower the temperature required for firing. When the ratio of B_2O_3 to SiO_2 is above 1:6.5, the glazes are milky, and when below 1:5, quite opalescent. Boric acid makes the glaze hard and brilliant.

From the experiments, peeling seems to be more a fault of the body than of the glaze, and a high acidity causes devitrification rather than peeling.—W. C. H.

Glaze; Notes on the Crimson Chromium-Tin.—F. J. Rodgers and J. W. Mellor. Trans. Eng. Ceramic Soc., 1904-5, 66—71.

I. *Effects of Chromium obtained from different sources*.—The tint obtained is practically independent of the source of the chromium. This was shown by heating up to about

1260° C. a mixture of:—Stannic oxide, 50 parts; whiting, 25 parts; flint, 18 parts; borax, 4 parts; white lead, 4 parts, with 1.5 part of chromic acid or its equivalent in potassium chromate, potassium bichromate, potassium trichromate, potassium tetrachromate, tin chromate, calcium chromate. Chromic oxide is more convenient than the potassium chromate usually employed, and since it is practically insoluble in water, removes the difficulty of crystallisation in subsequent operations, though with a soluble chromate it is possible to get a more uniform mixture.

II. *Influence of Zinc Chromate*.—This added to the crimson stain with the ordinary lead glaze deepens the tint, diminishes the tendency to "milky" or "dull" surface, increases the range of temperature in firing, gives as a rule, a more brilliant surface, and in quantities below 1 per cent. does not interfere with the transparency.

III. *The effect of Lime*.—The colour will bear a higher temperature the greater the proportion of lime up to 25 per cent. of whiting, and can be obtained at a lower temperature if lime be present; in other words, the temperature range of stability is extended.

IV. *Can Alumina replace Stannic Oxide?*—The glaze which the authors obtained by replacing stannic oxide with alumina, and firing in a saggar along with the ordinary crimson glazes had a fine yellow colour in daylight, with a green tinge in gas-light, and they have not yet succeeded in producing a crimson or pink chromium glaze without stannic oxide.

V. *Can a Pink be obtained without Chromium?*—The pink colours obtained with pure calcium carbonate and pure stannic oxide, the authors attribute to coloration from volatilised chromic oxide from colours in other parts of the saggar, and qualitative analysis showed that chromium was always present in those test-pieces, where the pink colour was developed.

Two photomicrographs of transverse sections through two tiles covered with the crimson glaze accompany the

paper. The glaze No. 1 was compounded from the formula:—

and No. 2 from:—

Both contained the same amount of stain and were fired at the same temperature. By reflected light the glaze appears as a yellow glass in which a few red particles are suspended. In No. 1 the surface is smooth, the glaze clear and transparent, and the colour inclines to redness. The glaze contained a few air-bubbles and was inclined to craze, and had better solvent properties than No. 2, which was richer in lime and poorer in lead. In No. 2 the surface was not so smooth, and the glaze lacked the depth and transparency of No. 1, whilst the colour inclined to purple.—W. C. H.

ENGLISH PATENTS.

Glass; Production of Sheet —. G. C. Marks, London.
From I. W. Colburn, Franklin, Pa. U.S.A. Eng. Pat.
13,788, July 4, 1905.

By this invention the sheet is drawn from a mass of molten glass, and simultaneously a lateral movement is given to the molten glass at or near the points at which the edges of the sheet emerge. Means are provided for imparting sufficient heat to the surface in the working chamber to break up any surface waves. The drawn sheet is heated sufficiently to allow of bending and scoring operations being performed, while at the same time the glass is kept hard enough to avoid injury to its fire-finish. The scored sheet is passed into a cooling chamber, where, whilst protected from exterior blasts of cold air, its temperature is gradually lowered. Means are provided for carrying out mechanically the various stages of the process—fixing the "bait," drawing the sheet, and imparting the lateral movement to the surface, and for adjusting the revolving bodies, heating the surface to break up waves, and scoring and severing the sections whilst the drawing operation is being carried on.—W. C. H.

Enamelling Metal Work; Impts. in —. W. R. Comings,
Wimbledon Park, Surrey. Eng. Pat. 28,930, Dec. 30,
1904.

ACCORDING to this process the surface of the metal to be enamelled is thoroughly cleaned, and before it has time to oxidise, the piece is placed in a highly heated bath of enamel and allowed to remain therein till it has reached as nearly as possible the same temperature as the bath. It is then removed, and the enamel baked or dried while the metal is cooling and contracting. The enamel is said thus to become firmly united with the surface of the metal. As an alternative, the metal may be heated in an atmosphere of non-oxidising gas such as nitrogen or hydrogen. The best results are obtained when the heating bath is hotter than the drying bath, say, 300°–350° F. for the former, and 200°–300° F. for the latter.—W. C. H.

UNITED STATES PATENTS.

Glass; Manufacture of Sheet —. H. K. Hitchcock,
Akron, Ohio, Assignor to C. W. Brown, Pittsburg, Pa.
U.S. Pat. 805,064, Nov. 21, 1905.

THE molten glass is forced from a receptacle through an upwardly-discharging slot or orifice outside the receptacle. Means are arranged by which the glass is held in tension and pulled away from the slot at approximately the same rate as that at which it is fed through the slot. Rotatable blades are operated at certain intervals by the pulling mechanism for severing or cracking the glass beyond the point at which it is held in tension, and means are provided whereby the severed glass is delivered to a heated chamber.—A. G. L.

Glass Articles; Manufacture of —. H. K. Hitchcock,
Akron, Ohio, Assignor to C. W. Brown, Pittsburg, Pa.
U.S. Pat. 805,065, Nov. 21, 1905.

MOLTEN glass is forced to a point near the end of an orifice having a shape similar to that of the finished article, the surface of the glass being cooled at this point by contact with the enveloping orifice. Tension is applied to pull away the cooler glass from the orifice, whilst glass at a higher temperature is caused to flow up and into this envelope of cooler glass, which prevents the spreading out or narrowing of the molten glass. Means for severing the glass at intervals are also provided.—A. G. L.

Kiln for Annealing Glass. H. K. Hitchcock, Tarentum,
Pa. U.S. Pat., 805,069, Nov. 21, 1905.

THE glass to be annealed is moved through a series of ovens, each of which is heated to a temperature equal to, or slightly higher than, that of the preceding oven before the glass is moved from the latter. In each oven the hearth and crown are constructed to form free radiating surfaces of equal thickness, so that the dissipation of heat from all parts of the hearth and crown may be approximately equal. Vertical passages are arranged in the side walls of each oven which are heated by gas burners, the products of combustion escaping through a valved outlet. The sill of each oven is movable, and means are arranged for shifting it.—A. G. L.

Glass; Manufacture of —. H. K. Hitchcock, Walton,
Pa., Assignor to C. W. Brown, Pittsburg, Pa. U.S.
Pat. 805,139, Nov. 21, 1905.

THE lime and silica are heated to a temperature at which the less refractory materials can act on them in order to eliminate impurities, and the vapour of the fluxing alkali salt is then forced through the heated mass, the glass formed being subjected to a "reduced surface-pressure."

—A. G. L.

Quartz Glass free from Air Bubbles; Producing —.
R. Küch, Assignor to W. C. Heraeus, Hanau, Germany.
U.S. Pat. 805,302, Nov. 21, 1905.

SEE Eng. Pat. 3906 of 1905; this J., 1905, 498.—T. F. B.

Quartz Glass Articles; Producing Hollow —. R. Küch,
Assignor to W. C. Heraeus, Hanau, Germany. U.S.
Pat. 805,303, Nov. 21, 1905.

SEE Eng. Pat. 4663 of 1905; this J., 1905, 498.—T. F. B.

Quartz-Glass Vessels; Method of Protecting —. R. Küch,
Assignor to W. C. Heraeus, both of Hanau, Germany.
U.S. Pat. 805,304, Nov. 21, 1905.

To prevent the breaking of quartz-glass vessels filled with metals solid at the ordinary temperature, the inside of the vessel in contact with the metal is coated with carbon, by passing a current of gaseous hydrocarbon, e.g., ordinary illuminating gas, through the vessel and heating the walls of the vessel, from without, to their softening point.

—A. G. L.

FRENCH PATENTS.

Glasses; Manufacture of Tinted Optical —. J. J.
Davignon. Fr. Pat. 356,322, July 21, 1905.

THIS invention relates to the manufacture of optical glasses tinted bluish-green, the tints varying from light to dark, from substances specified, requiring eight to ten hours for "founding," for which during the first two hours, the temperature is about 1200°, and for the following five hours it is raised to a maximum of 1400°–1450° C. Such tinted glasses are claimed as new products. The substances specified are sand, rock crystal, dry sodium carbonate, and calcium carbonate, together with proportions according to the tint required, of copper sulphate, ferric oxide, calcined borax, saltpetre, calcined bone, cobalt oxide (or carbonate), zinc oxide and alumina, with prantium oxide for dark blue green.—W. C. H.

Ceramic or other Bodies; Process of Instantaneous Firing, Enamelling, and Decoration of —, and of Cooling and Tempering Glass-ware. F. Garros. Fr. Pat. 356,545, July 31, 1905. Under Int. Conv., Aug. 4, 1904.

THIS invention relates to a new method of firing, enamelling and decorating, so to speak, instantaneously, ceramic objects (porcelain, faience, gr. s., earthenware), the practically instantaneous cooling of glass, by which a new kind of tempering is possible, and of avoiding air-blasts in enamelling and the superficial "vitrification" of metals. The method consists in enclosing the objects in boxes, composed of material which is a good conductor of heat, and has a low specific heat. In many cases in practice, the boxes need not be covered.—W. C. H.

GERMAN PATENT.

Glass Metal; Process for the Decolorisation of —. J. Kersten. Ger. Pat. 162,507, Feb. 20, 1903.

THE use of titanium compounds either alone or in conjunction with other agents for the decolorisation of glass is claimed. It is stated that by the use of titanium compounds, white glass can be produced either in melting-pots or in tank-furnaces.—A. S.

IX.—BUILDING MATERIALS, CLAYS, MORTARS, AND CEMENTS.

(Continued from page 1233.)

Portland Cement; Detecting Injurious Quantities of Gypsum in —. Gresly. Tonind. Zeit., 1905, 29, 1679; Chem.-Zeit., 1905, 29, Rep., 360.

THE formation of calcium sulphaluminate occurs more rapidly in the test blocks of Portland cement mortar, and the resulting cracks become sooner apparent when the plates have been exposed for a short time to dry heat (over 100° C.) before being placed under water. The author found that unheated samples retained their good appearance after 14 days under water when the gypsum content was as high as 10 per cent., whilst heated cakes containing 6 per cent. of gypsum exhibited fine cracks on the under surface after five days' immersion, small concentric cracks forming by the seventh day and the edges crumbling by the tenth day. Further tests showed that the beneficial effects of the heating treatment in revealing the presence of gypsum are nullified by subsequent boiling, but are restored by reheating. The higher the heating temperature, the sooner is the presence of gypsum revealed. A useful manner of applying the test is to heat the hardened blocs of pure cement at 200—300° C. for six hours, and observe their behaviour while immersed in cold water. In the case of Roman cement moist heat is as effective as dry. Slag cements will bear an unusually large addition of gypsum, but the author does not believe that Portland cements rich in gypsum can be prevented from crumbling under water by the addition of blast-furnace slag.—C. S.

Cement-Concrete; Notes on the Destruction of Building Materials made of —. W. Thörner. Chem.-Zeit., 1905, 29, 1243—1248.

I. *Destruction of a Large Drain made of Cement-Concrete by the Action of Moor Water Containing Sulphuric Acid.*—The author describes a case in which a concrete drain showed signs of failure after having been in use for six months. The concrete was coloured dark green or brownish-red and was so soft in places that it could be cut with a knife. A great part of the cement had been converted into calcium sulphate. The signs of failure were especially marked in those portions of the drain between the extreme levels of the water in it. Investigation showed the materials used in building the drain to have been of excellent quality. The failure was due to the fact that the moor contained considerable quantities of pyrites. The building of the drain had promoted rapid oxidation of the pyrites, so that the moor water contained considerable quantities of ferrous sulphate (np to

1152.6 mgrms. per litre) as well as other sulphates, besides free sulphuric acid (up to 86.9 mgrms. per litre), which had interacted with the cement of the concrete. Direct experiments showed that synthetic solutions, similar in composition to the moor water, cause rapid destruction of cement. Various means of protection are discussed, such as surrounding the drain with a layer of pieces of limestone, or with clay; but from his experiments the author is of opinion that at the worst places, at least, the drain should be altogether replaced by one composed of acid-resisting bricks bedded in asphalt.

II. *Destruction of Concrete Slabs and Pipes owing to the Use of Rhine Gravel Containing Particles of Coal.* These concrete slabs and pipes showed brown discoloration, in places accompanied by cracks; occasionally a small piece had cracked off altogether. In each of these cracks small dark particles were found, which, on analysis, proved to be coal, which probably came from the Rhine sand used, the contamination of the sand being due to the practice on the Rhine steamers of simply throwing their ashes, containing some unburnt material, overboard into the river.—A. G. L.

Fermentation Squares; Large Cement —. W. Windisch. XVII., page 1417.

ENGLISH PATENTS.

Stone; Manufacture of Artificial —. F. N. Beavell, Leytonstone, Essex. Eng. Pat. 21,233, Oct. 4, 1904.

CRUSHED granite, slag, &c., is freed from dust by means of an air-blast before being mixed with the cement and water, both blowing and mixing being done whilst the gravel falls down a vertical tube. The mixture is moulded under pressure; the moulded mass is turned out of the mould before its surface has set hard and scratched or stippled with file-carding or similar substance, after which sodium silicate solution is sprayed over the surface.—A. G. L.

Drying Gelatin, Glue, Paste Goods, Brewers' Grains, Bricks, Woods, Metal Articles and the like; Apparatus for —. O. Koepff. Eng. Pat. 5748, March 18, 1905. I., page 1291.

UNITED STATES PATENT.

Quartz Brick or Block; Fireproof —. E. Stöfler, Zurich, Switzerland. U.S. Pat. 805,242, Nov. 21, 1905. SEE Eng. Pat. 11,258 of 1904; this J., 1905, 985.—T. F. B.

FRENCH PATENTS.

Macadam; Preservation and Improvement of — by Preventing the Formation of Dust Resulting from the Surface Disintegration. E. D. de Liebhaber. Fr. Pat. 356,330, July 22, 1905. Under Int. Conv., July 25, 1904.

THE inventor claims the use of calcium chloride or other similar deliquescent salts, especially magnesium chloride, in concentrated solution, to secure the homogeneity, improvement and preservation of roadways, streets and other surfaces, and also to prevent or diminish the disintegration of the surfaces, and the resulting formation of dust. (See also Eng. Pat. 16,993 of 1904; this J., 1905, 802.)—W. C. H.

Roads; Process for Preparing a Liquid to Prevent the Formation of Dust and Ice on —. G. J. C. M. de Liebhaber. Fr. Pat. 356,331, July 22, 1905. Under Int. Conv., Aug. 3, 1904.

SEE Eng. Pat. 16,993 of 1904; this J., 1905, 802.—T. F. B.

Slag; Process for the Transformation of Blast-Furnace — into Cement. H. Colloseus. Fr. Pat. 356,276, July 12, 1905.

BY this process, blast-furnace slag is converted into cement by treating the molten slag, in a finely divided condition, with aqueous solutions of salts of calcium, aluminium and magnesium soluble in water. (See also Eng. Pat. 13,886 of 1905; this J., 1905, 971.)—W. C. H.

Slag; Process for Dissolving Solid Fluxes in Molten —.

F. C. W. Tumm. Fr. Pat. 356,252, July 20, 1903.
Under Int. Conv., July 29, 1904.

THE process is intended for dissolving fluxes (lime, manganese dioxide, iron oxide, &c.) in molten blast-furnace slag, in the manufacture from the latter of cement, slag-wool, artificial stone, and the like. The solid flux mixed with coke is charged into a tall vessel or shaft, provided at the bottom with tuyères, through which is forced a blast of air to burn the coke and heat the mixture to incandescence. Or, the shaft may be charged with the flux alone, and the latter heated to incandescence by means of gaseous or liquid fuel injected with the air through the tuyères. The molten slag from the furnace enters the top of the shaft and flows down through the incandescent mass, dissolving the flux to a homogeneous solution, which is drawn off at the bottom.—A. S.

X.—METALLURGY.

(Continued from page 1234.)

Silicon Chloride; Action of —, on Iron. E. Vigonroux. Comptes rend., 1905, 141, 828—830.

WHEN the vapour of silicon chloride is passed over iron, reaction begins below a red heat, and is represented by the equation: $\text{SiCl}_4 + 4\text{Fe} = \text{Fe}_2\text{Si} + 2\text{FeCl}_2$. No lower chloride of silicon is formed, and no farther action of silicon chloride upon the silicide (which would produce a silicide containing more silicon) occurs.—J. T. D.

Cuprosilicon; Industrial —. P. Lebeau. Comptes rend., 1905, 141, 889—891.

MICROGRAPHIC examination of a sample of cuprosilicon, as well as extraction of the constituents by solvents, showed it to be a mixture of silicide and free silicon. The substance was not homogeneous, the silicon content varying from 56 to 60 per cent. The extracted silicide contained 10.5 per cent. of silicon, corresponding nearly with the formula SiCu_4 . It thus appears that, even in presence of an excess of silicon, the higher compound SiCu_2 is not formed in these alloys.—J. T. D.

Zinc; Properties of Sheet — and Influence of Impurities.

O. Meyer. Oesterr. Z. Berg.-Hütt., 1905, 53, 522—527; 538—541. Chem. Centr., 1905, 2, 1576.

ON etching rolled sheet zinc containing small amounts of other metals (cadmium, lead), with 5 per cent. nitric acid for 10 minutes, the thickness is considerably reduced, but unlike in the case of iron, the elasticity and crystalline structure of the metal shows no alteration; the results of bending tests are indeed slightly higher after the treatment than before. On heating rolled zinc to about 145° C., or, in many cases, somewhat higher, however, the mechanical properties are injured, the most marked effect being the increase of brittleness.

An addition of 0.2 per cent. of cadmium improves the quality of zinc, the transformation temperature being raised and the mechanical properties of the metal improved. The addition of lead or of 0.4 per cent. or more of cadmium proved of no influence in some cases, unfavourable in others, and did not, in any case, improve the qualities of the zinc. The presence of cadmium and lead together in the zinc is distinctly injurious. (See also Novak, this J., 1905, 1237.)—A. S.

Antimony; Modification of —. A. Stock and W. Siebert. Ber., 1905, 38, 3837—3844.

BESIDES ordinary antimony, a black and a yellow modification exist. The black modification is obtained by rapid cooling of the vapour of the ordinary form, by reacting with oxygen on liquid stibine at temperatures above —90° C., or by molecular transformation of the yellow form. The apparatus used to prepare yellow arsenic (this J., 1905, 28, but the authors now prefer a platinum wire resistance wrapped round a porcelain tube to the crystal there described) is filled with pure stibine, which is decomposed by heat so that its metal is deposited on the inner tube, the little beaker having been removed. The

apparatus is exhausted, immersed in liquid air, and the antimony volatilised at the lowest possible temperature (300° C.), when it forms a black deposit on the walls.

Should the temperature rise too high, ordinary grey antimony is deposited. Or, oxygen in as small bubbles as possible is passed through liquid stibine at —40° C., when black antimony is deposited. Only small amounts are obtainable in either way, and the third-mentioned process yields more minute quantities still. Black antimony is amorphous, has a sp. gr. of 5.3, is more volatile than grey antimony, into which it is slowly converted at 100° C., and instantaneously, with heat evolution at 400° C. It is chemically active, oxidising in air at the ordinary temperature, sometimes so energetically as to catch fire. It seems to be formed (along with grey antimony) in several reactions, as reduction of antimonious chloride by aluminium, decomposition of sodium antimonide by water or magnesium antimonide by hydrochloric acid, &c.

Yellow antimony is obtained by passing oxygen through liquid stibine at —90° C. The reaction is very slow, and though slightly quickened by presence of a trace of ozone in the oxygen, yielded only 3 or 4 mgrms. of product; after that, the substance blackens, and then farther reaction produces the black form. It can be obtained in slightly larger amounts by the reaction at —100° C. of solutions in liquid ethane of chlorine and of stibine. Direct analysis has not yet proved this yellow substance to be antimony, but it is highly probable that it is so—it contains no hydrogen, no water, and no chlorine. It is exceedingly unstable, blackening as soon as its temperature rises above —90° C., even in the dark. It seems not to be soluble in carbon bisulphide, but to form a colloidal suspension, looking like a yellow solution. Possibly black antimony may be identical with the α -antimony which Cohen assumes to be the modification causing "explosive antimony."—J. T. D.

Soldering; Application of Acetylene, in Autogenous —.

S. Traubel. J. f. Gasbeleucht., 1905, 48, 1069—1070.

ATTEMPTS to substitute acetylene for hydrogen in autogenous soldering have not been very successful, as the acetylene has been used under pressure. In the Fouché system, it is used at the ordinary pressure of a few mm. of water column above the atmosphere, and the construct on of the burner prevents any flashing back. In the case both of hydrogen and acetylene, it is found desirable in practice to use for soldering a deficiency of oxygen—0.25 instead of 0.5 volumes for one volume of hydrogen, and 1.7 instead of 2.5 volumes for one volume of acetylene. The amounts of heat evolved by 1 cb. m. of each of these mixtures are 2072 and 5375 calories respectively. More over, the oxyhydrogen flame is much larger than the oxy-acetylene, and the heat is in the latter concentrated much more in a particular part, so that the temperature is much higher than in the oxy-hydrogen flame. Add to this that the outer part of the flame consists of reducing gases, hydrogen and carbon monoxide, and the advantages of acetylene are manifest. The author calculates the cost of soldering plates of different thicknesses, with hydrogen, oxygen, and acetylene costing 1.25, 4 and 1 mark per 1000 litres respectively, as follows:—

Thickness of Plate.	Cost per Metre.	
	Hydrogen.	Acetylene.
mm.	Marks.	Marks.
1	0.115	0.05
2	0.28	0.132
3	0.562	0.275
5	too costly	0.468
7	"	0.882
9	"	1.63

With thick plates it is desirable, for economy, to heat up first with an ordinary blow-pipe.—J. T. D.

Explosives; Aluminium in —. C. E. Bichel. XXII., page 1324.

ENGLISH PATENTS.

Metals: Separation of — from their Ores. J. D. Wolf, London. Eng. Pat. 17,407, Aug. 10, 1904.

THE ore mixed with water to form a wet pulp is fed on to the upper end of an inclined belt of stout canvas, moving over two rollers from the lower to the upper one. The belt has a ridge on each side to prevent the wet pulp from running off sideways, and is supplied with oil or grease of high viscosity and cohesion, e.g., heavy hydrocarbon oils treated with sulphur chloride, or residual oils, which causes the ore particles to adhere and be carried upwards with the belt, whilst the gangue and water flow down, and off the belt past the lower roller. Near the upper roller is a water-spray which washes off any loosely adhering particles of gangue; the belt then meets a scraper, which removes oil and ore particles; after which it comes in contact with an oiling device, and again passes over the lower roller.—A. G. L.

Ore Washing Machinery; Impts. in —. C. W. Denison, Denver, Colo., U.S.A. Eng. Pat. 4388, March 3, 1905.

THE invention consists of a buddle in which a hollow vertical shaft is mounted, so that it may be rotated in a step bearing. This shaft or independent shafts carry two conical tables, consisting of duck or other similar material spread over wide-meshed wire netting. An annular trough is placed around the circumference of each table, and is fitted with suitable partitions and shoots to carry away material. Water is caused to flow through the hollow shaft, emerging by arms placed over the tables, which arms distribute the water evenly. The rotation of the shaft may be effected by the back-pressure of the water leaving these arms, or, where water is scarce, may be effected by machinery. The material to be treated is fed on to the upper and larger table; the lower and smaller table serves to wash the fine gold or the like, which is removed from the upper one at intervals, a second time.—A. G. L.

Smelting Ores and Separating Mattes and Recovering Mineral Values from Slag. R. Baggaley, Pittsburg, Pa., C. M. Allen, Lo Lo, Mont., and E. W. Lindquist, Chicago, Ill., U.S.A. Eng. Pat. 8386, Apr. 19, 1905.

SMALL ore charges are continuously or intermittently introduced into a closed converter, which is supplied with an initial charge of molten matte. After Bessemerising, the matte and slag are discharged into a covered forehearth, the temperature of which is maintained as high as possible. In their passage along this forehearth, which is about 20 ft. long, the matte and slag are perfectly protected against the chilling effect of the air, and consequently the matte separates out practically completely. (Compare U.S. Pat. 789,648 of 1905; this J., 1905, 624.)—A. G. L.

Iron Ores; [Magnetic] Treatment of —. The Hernadthalier Ung. Eisenindustrie Act.-Ges. and E. Primosigh both of Budapest, Hungary. Eng. Pat. 16,643, Aug. 16, 1905.

CYLINDRICAL bell magnets are mounted on, and rotate around, a horizontal shaft, the annular poles of these magnets being directed towards each other. The material to be treated is fed in between these annular poles, with the result that the non-magnetic particles are at once ejected by centrifugal force, the ferbly magnetic particles adhering for a time and falling between suitably placed partitions, whilst the strongly magnetic particles are carried nearly all the way round and are only removed by a stripping device.—A. G. L.

Iron and Steel with Other Metals; Method of Uniting or Coating —, and Fluxes employed for that purpose. E. L. Davies and W. G. Clark, both of Wessels Nek, Natal. Eng. Pat. 17,660, Aug. 13, 1904.

IRON or steel is covered with copper, gold, silver, or their alloys by heating the iron or steel to a temperature at which it oxidises readily, but which is below the boiling point of the other metal, covering the surface of the metal with a flux, cleaning the surface by means of scrapers passing across it, and then adding the other metal in the

molten condition, and agitating it so as to cover the whole of the surface, after which the flux is removed and the whole allowed to cool. The flux consists of silica, sodium carbonate, and sodium borate in about equal proportions, to which is added 1 per cent. of sodium phosphate or bone ash, but the proportions may be varied somewhat.—A. G. L.

Iron or Steel Surfaces; Removal of Copper and Nickel from —. W. R. Hodgkinson, London. Eng. Pat. 3225, Feb. 16, 1905.

SOLUTIONS containing ammonia in conjunction with an amide or an organic ammonium salt, with or without the addition of nickel or copper chloride, are used to remove nickel or copper from steel or iron surfaces without injuring the latter. Suitable solutions, which may be used repeatedly are: (1) A saturated solution of urea in cold glycerin to which are added 5 per cent. of strong ammonia solution and 0.1 per cent. of nickel or copper chloride. (2) Formic acid, 375 c.c.; ammonia, sp. gr. 0.880, 1875 c.c.; cuprous chloride, 60 grms.; water, 6000 c.c. A solution which is quicker in its action than either of the above, but can only be used once, consists of 1 lb. of ammonium persulphate dissolved in 1 gall. of ammonia (sp. gr. 0.880).—A. G. L.

Iron and Steel; Manufacture of Charcoal —. J. J. Hudson, Philadelphia. Eng. Pat. 5367, March 14, 1905.

SEE U.S. Pat. 785,002 of 1905; this J., 1905, 336.—T. F. B.

Steel for Railway and Tramway Rails; Manufacture of —. C. P. Sandberg, London. Eng. Pat. 7698, April 11, 1905.

THE crude steel is freed as far as possible from silicon, as in the manufacture of tool steel, and a material rich in silicon, e.g., silicious spiegel or ferro-silicon, is then added in such proportion that the final product contains 0.25 to 0.5 per cent. of silicon.—A. G. L.

Amalgamators; Impts. in —. D. Draper and G. A. Hay, both of Johannesburg, Transvaal. Eng. Pat. 4744, March 7, 1905.

THE amalgamator consists essentially of a rotating drum, with horizontal axis, the periphery of the drum being the amalgamated surface. The drum is enclosed in a casing, and ore-pulp is delivered on its surface from a pipe in a direction opposed to that of rotation. The gold and concentrates being caught by the amalgam, the tailings flow out through a pipe near the bottom of the casing. The concentrates are then washed off by a water-spray inside the casing, and fall into a recess in the latter, from which they are removed. A revolving brush for cleaning the amalgam is placed in the upper part of the casing so that its action can be watched through a glass plate fixed in the latter. The amalgam is scraped off from time to time by a scraper placed in the lower part of the casing, and which may be made to traverse the whole of the surface of the drum longitudinally. The action of the amalgamator is continuous or practically so.—A. G. L.

Furnaces; Crucible —. F. Forster, Grütze, Switzerland. Eng. Pat. 12,300, June 13, 1905.

SEE FR. Pat. 355,155 of 1905; this J., 1905, 1239.—T. F. B.

Furnaces; Hearths of Roasting and like —. J. E. Greenawalt, Denver, U.S.A. Eng. Pat. 12,320, June 13, 1905.

Furnaces; Tilting —. F. H. Treat, Pittsburg, U.S.A. Eng. Pat. 15,296, July 25, 1905.

SEE U.S. Pat. 802,151 of 1905; this J., 1905, 1177.—T. F. B.

Drying Gelatin, Glue, Paste Goods, Brewers' Grains Bricks, Woods, Metal Articles and the like; Apparatus for —. O. Koepff. Eng. Pat. 5748, March 18, 1905. L., page 1291.

UNITED STATES PATENTS.

Furnace; Combined Smelting and Refining —. C. C. Medbery, New York. U.S. Pat. 804,330, Nov. 14, 1905.

THE furnace consists of a cylindrical heating chamber lined with firebrick or other refractory material, and mounted so that it can be rotated and also tilted to any desired position. The chamber has a central opening at each end. At one end, in which two or more tapping holes are provided, the opening is closed by a muffle-door, whilst the opening at the other end of the chamber carries a hollow bearing which supports a "slip-joint" connected to a fuel-supply device and to a chimney. Cooling water is circulated in the hollow bearing. By means of this slip-joint, fuel can be supplied to, and the products of combustion discharged from the chamber, while the latter is being rotated. The fuel-supply device consists of a burner nozzle with suitable pipes for supplying the fuel (oil) and compressed air.—A. S.

Furnace; Roasting —. A. W. Chase, Avoca, Iowa. Assignor to The Chase Furnace Co., Philadelphia, Pa. U.S. Pat. 804,379, Nov. 14, 1905.

A SERIES of troughs, one above the other, composed of U-shaped fire-clay sections, is supported between the end walls of the furnace. Conveyors, mounted on hollow shafts, are rotated in the troughs and feed the material from each trough to the one below. The conveyors are driven at different speeds, increasing from the top one downwards, and the hollow shaft is supplied with a cooling fluid. Plates having circular openings and slots are fitted over openings in the end walls of the furnace, and to these plates are affixed other removable plates made in two sections, fitting round the conveyor shafts, and adapted to close the openings in the fixed plates.—A. S.

Furnace; Roasting —. A. R. Meyer, Assignor to The United Zinc and Chemical Company, Kansas City, Mo. U.S. Pat. 804,751, Nov. 14, 1905.

THE furnace comprises a hollow vertical shaft through which passes a central rod, whilst hollow stirring arms extend in pairs from hollow bosses disposed at intervals in opposite sides of the shaft. There are partitions extending across the shaft and centrally through the hollow bosses and stirring arms, and other partitions dividing the shaft into compartments, alternate ones of which carry the stirring arms. Water is fed in at the top of the shaft and flows down in contact with the inner face thereof, collecting in gutters between the partitions, and flowing from one gutter to the next below, through valved pipes passing through the partitions. A cooling fluid (air) is supplied to the bottom of the shaft and escapes at the top.—A. S.

Furnace; Roasting —. A. R. Meyer, Assignor to The United Zinc and Chemical Co., Kansas City, Mo. U.S. Pat. 804,752, Nov. 14, 1905.

A HOLLOW pipe or shaft carries, on opposite sides, a series of arms, which extend through bosses on the shaft, and have their inner ends interlocked within the shaft. Ports are provided in the bosses communicating with outlet ports in the arms, the latter in turn being connected with a discharge flue down which water is made to flow. The arms are also provided, nearer their inner ends, with inlet ports communicating with a supply flue to which air is admitted. Water is fed in at the top of the shaft and is held at different points within the shaft by gutters, which have perforations inclined to discharge the water towards the inner face of the shaft.—A. S.

Iron Oxide; Preparing —, for use in Blast Furnaces. U. Wedge, Ardmore, Pa. U.S. Pats. 804,692 and 804,693, Nov. 14, 1905.

IRON oxide in small particles is prepared for use in a blast-furnace, by mixing it with powdered argillaceous matter, or with the flue-dust of Portland cement-burning furnaces, or with the cement itself, and subjecting the mixture, with agitation, to sufficient heat to fuse the iron oxide particles.—E. S.

Metallurgical Process. W. E. Everette, Tacoma, Wash. U.S. Pat. 804,936, Nov. 21, 1905.

THE pulverised materials are treated with liquid oxygen, whereby they become "extremely frigid" and occlude a portion of the oxygen, and are then forced into and through a suitable melt, which has been previously prepared and heated to incandescence. The metal and slag produced are drawn off at different levels. It is stated that the metals contained in the charge, are largely freed from sulphur and phosphorus, and are rapidly fused.—A. S.

Metal-Leaching Process. T. B. Joseph, San Francisco, Cal. U.S. Pat. 805,017, Nov. 21, 1905.

THE process is for the extraction of metals, such as gold, silver, copper and nickel, from ores, by extracting the latter with a solution containing water, sodium cyanide and ammonium carbonate, with the addition, in certain cases, of one or more of the following substances:—Ammonium nitrate, calcium hydroxide, sodium bicarbonate. The amount of ammonium carbonate used is in excess of that of sodium cyanide and the extraction may be accelerated by the use of compressed air. The metals are precipitated from the solution by known methods.—A. S.

Zinc and Aluminium Plates for Printing Purposes; Process for Preparing —. E. O. Schmiel, Leipsic, Germany. U.S. Pat. 805,031, Nov. 21, 1905.

ZINC and aluminium plates are prepared for printing by rubbing them over with acetic acid before the drawing or the like is applied. After applying the drawing, the plates are etched with a saturated solution containing equal parts of acid oxalate of potassium and gum-arabic.—A. S.

Amalgamator. C. W. Patten, Lynn, Mass. U.S. Pat. 805,090, Nov. 21, 1905.

THE apparatus consists of a trough containing mercury, having a shallow portion of uniform depth, with a weir at the discharge end of this shallow portion, and a pit or well of greater depth at the opposite end of the trough. One or more "submerging-drums" are disposed in the well or deep end of the trough, and a rotating water-supply pipe extends transversely across the trough, having jet orifices, through which water is discharged on to the surface of the mercury between the weir and the drums.—A. S.

[Iron] Metal; Method of Making Oxide-coated Sheet —. A. Ridd, Newport, Ky. U.S. Pat. 805,095, Nov. 21, 1905.

SHEET iron is rendered rust-proof by heating it in an annealing or heating furnace, applying a heavy, uniform layer of dry, powdered iron oxide to its surface, then passing between heated rollers, and afterwards annealing.—A. S.

Iridium; Art of Producing Metallic —. H. C. Parker, New York, Assignor to Parker-Clark Electric Co., Jersey City, N.J. U.S. Pat. 805,316, Nov. 21, 1905.

IRIDIUM-AMMONIUM chloride in the form of powder is mixed with excess of a reducing agent, such as ammonium chloride, the mixture is placed on or "confined in" a refractory substance, and heated to drive off the volatile matter, whereby coherent, metallic iridium is produced.—A. S.

Ores; Process of Concentrating —. W. M. Sanders, Iola, Kans. U.S. Pat. 805,382, Nov. 21, 1905.

ZINC sulphide ores are treated with a non-acid solution containing a sulphate of an earth metal, and capable of reacting with the ore with evolution of gas, and the particles that are sustained by the evolved gas are separated.—A. S.

FRENCH PATENTS.

[Alloys] Metal in another Metal; Process permitting of the Incorporation of a — Without Fusion of the latter. H. L. Herrenschildt. Fr. Pat. 350,232, Oct. 18, 1904.

THE invention has mainly in view the incorporation of vanadium, titanium, manganese, aluminium, molyb-

denum, &c., with copper, without fusion of the latter. Any one of the metals named may be presented to the previously-heated copper, while in a fused and highly-heated state. The cementation may be effected by the aluminothermal process, or by aid of the electric furnace, or other wise. As an example, in effecting the cementation of vanadium with copper, vanadic acid is mixed with the proportion of aluminium necessary for the reduction, and the rod of copper is plunged into the mixture, which, being lighted, gives a nodule of vanadium, whilst the copper, without having been fused, has absorbed vanadium, together with a little aluminium. In some cases the bar or piece of copper to be cemented, is heated to from 600° to 900° C. before being brought into contact (as in the electric furnace) with the fused and highly-heated metal with which it is to be cemented.—E. S.

Chemical Reaction; Process and Apparatus for Promoting Energetic ——. C. G. P. de Laval. Fr. Pat. 356,096, July 12, 1905. Under Int. Conv., July 19, 1904.

FIG. 1.

FIG. 2.

The reactions between gases and solid, liquid or gaseous substances, are brought about in a chamber 1 provided with tangential tuyeres at 5 and 6 (see figures). The material to be treated is introduced at the top of the chamber from the hopper 2, whilst the gases passing through the tuyeres cause a rapid mixing and rotation of the contents. Owing to the centrifugal action the liquid and solid products pass toward the sides and are collected in the annular receptacle at the base of the furnace, from which they are removed at 3. The gaseous products, on the other hand, pass out through the central exit 4, which may be cooled by water circulating through the pipes 7, 8. An oxidising or reducing action can be produced according to the nature of the gases introduced, or the furnace may have oxidising and reducing zones by using two tuyeres with injection of reducing or oxidising gases.—P. S. II.

Zinc, or Oxide of Zinc; Process of Extracting ——. C. G. P. de Laval. Fr. Pat. 356,097, July 12, 1905.

The powdered charge of mineral, mixed with the necessary flux and reducing material, is introduced into a furnace of the type described in the preceding abstract. Air or other gases are introduced through the tangential tuyeres and cause the rapid spiral rotation of the contents. The vapours of zinc or oxide of zinc pass out through the exit (4) and are condensed by any suitable process.—R. S. II.

Iron; Extraction of —— from its Minerals. C. G. P. de Laval. Fr. Pat. 356,098, July 12, 1905.

As in the two specifications abstracted above, the charge of mineral mixed with flux and reducing material is introduced through a central hopper and air or gases through tangential tuyeres. The iron collects in the annular chamber at the base of the furnace, whilst the gaseous products of the reaction pass through the central exit. The walls of this exit are water-cooled to prevent the dust carried by the gases from blocking the passage.—R. S. II.

Tin Plate; Impts. relating to the De-Tinning of Cuttings of ——. T. Goldschmidt. Fr. Pat. 356,228, July 18, 1905.

The cuttings are strongly pressed, for example, in wire baskets, and placed in a closed vessel, in which they are treated with gaseous chlorine or an anhydrous liquid containing chlorine under a varying, preferably increasing pressure; the tin is dissolved, and the stannic chloride formed, flows into a receptacle at the bottom of the closed vessel. When the tin is completely dissolved, the residual chlorine is removed by means of a current of an inert gas, and the de-tinned iron is washed with water and an alkaline lye.—A. S.

Metalliferous Substances; Process for Purifying and Forming into Nodules ——. T. C. King. Fr. Pat. 356,413, July 25, 1905. Under Int. Conv., Nov. 14, 1904.

Slag; Process for Dissolving Solid Fluxes in Molten ——. F. C. W. Timm. Fr. Pat. 356,252, July 20, 1905. IX., page 1308.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

(Continued from page 1212.)

(A).—ELECTRO-CHEMISTRY.

Chromium Sulphate; Role of Lead Peroxide as Anode in the Electrolytic Oxidation of —— to Chromic Acid. E. Müller and M. Soller. Z. Elektrochem., 1905, 11, 863—872.

Uron bright platinum anodes a solution of chrome alum in normal sulphuric acid gives practically no chromic acid on electrolysis. In presence of mere traces of lead the reaction is greatly favoured and the formation of peroxide of lead on the anodes is noticed under these conditions. The authors also confirm the fact that the electrolytic

regeneration of chromic acid progresses rapidly and with good efficiency when lead electrodes are employed. With platinised platinum electrodes, oxidation of the chromium sulphate is also observed, but the efficiency is only about one-third of that with lead electrodes under otherwise similar conditions. In attempting to account for these observations, it has been found that the oxidation is to be ascribed to the "catalytic action of lead peroxide" rather than to any marked "over-voltage" at lead and platinum anodes respectively. In confirmation of this, it is noted that chromic salts are also oxidised so as to yield chromic acid by lead peroxide, without any intervention of electrolysis.—R. S. H.

ENGLISH PATENTS.

Insulating Material; A New —, and Process for Preparing the same. J. Meyenberg, Baar, Switzerland. Eng. Pat. 12,105, June 9, 1905.

ANIMAL fibres, such as hair, wool, sponge cuttings, or the like, are cut up, collected in heaps, and subjected to the action of moisture at a temperature of from 20 to 27° C., until they become soft. The mass is then mixed with an alkaline lye, until it is homogeneous, and treated with, for instance solution of an acid chromium salt, whereby the "natural cement" (such as gelatin) is dissolved out. The flocculent precipitate formed is collected. The mass is then freed from the neutralised remains of the alkaline solution, and the filaments and "natural cements" thus "chemically separated," are subjected to a "mechanical combination," preferably by the use of a centrifugal separator. The mixture is worked up with a mixture of ozokerite, carnauba wax, colophony and linseed or almond oil in stated proportions, and is subjected in plates to very high pressure at a temperature of at least 80° C. Finally, to protect the plates of the insulating material against combustion, and to render them moisture-resisting, they are impregnated with a silicate solution and with hydrocarbons.—E. S.

Nitric Acid; Process for Producing — by Electricity. W. P. Thompson, London. From Westdeutsche Thomasphosphatwerke, G.m.b.H., Berlin. Eng. Pat. 25,010, Nov. 17, 1904.

SEE *Fr. Pat.* 348,189 of 1904; this *J.*, 1905, 441.—T. F. B.

Carbon Bisulphide; [Electrical] Process for the Production of —. A. Augier, Paris. Eng. Pat. 10,927, May 25, 1905. Under Int. Conv., May 31, 1904.

UNITED STATES PATENT.

Electrolytical Decomposition; Apparatus for —. G. E. Cassel, Stockholm, Sweden. U.S. Pat. 804,931, Nov. 21, 1905.

THIS invention relates to an electrode composed of two end plates of conducting material, with superposed plates upwardly inclined between the end plates, and approximately half the width of the latter; the superposed plates are also inclined towards each other with spaces between their adjacent edges. A closed hood, over the spaces and over all the inclined plates, is provided with an eduction pipe extending from one end plate to the other.—B. N.

FRENCH PATENTS.

Generator of Electricity; Thermo-Chemical —. L. P. Basset. *Fr. Pat.* 356,442, July 27, 1905.

A GAS-TIGHT vessel is divided into compartments by walls constructed alternately of carbon and of porous material. Through alternate compartments a dilute solution of sulphurous acid, or other oxidisable compound, is passed, whilst the other compartments are traversed by a dilute solution of sulphuric acid containing bromine, or other suitable dilute solution to which is added a body capable of fixing hydrogen. The end carbons are connected to the positive and negative terminals of an external circuit, through which passes the current generated in the vessel; the sulphurous acid is oxidised with simultaneous formation of hydrobromic acid. By means of an external

source of heat, and an appropriate arrangement, the active products are regenerated by the interaction of the sulphuric and hydrobromic acids, and the active products are passed back into their respective receptacles.—B. N.

Insulating Material and Process for Making the same; Electrical —. Soc. Anon. Matthey et Cie. *Fr. Pat.* 356,819, Aug. 11, 1905.

Chlorine; Employment of Gaseous Hydrochloric Acid for the Manufacture of —, by Electrolysis of its Solution Regenerated Continuously. E. F. Côte and J. B. Febvre. *Fr. Pat.* 356,115, July 12, 1905.

THE electrolytic cell is divided into two chambers. The solutions from the anode and cathode chambers are independently circulated and brought in contact with gaseous hydrochloric acid so as to continuously maintain their concentration. In this way danger of contact between the anode-liquid charged with chlorine and the cathode liquid charged with hydrogen is avoided.

Means are also provided for cooling the electrolyte and for observing the level of the liquid in the two chambers of the cell.—R. S. H.

GERMAN PATENTS.

Lead Peroxide; Process for the Electrolytic Preparation of — from Lead Sulphide. F. R. Steigelmann. *Ger. Pat.* 162,107, Jan. 16, 1903.

LEAD sulphide is used as the anode, whilst the electrolyte consists of water, to which only sufficient sulphuric acid (less than 1 per cent.) is added to render the water a good conductor, whilst excluding the formation of sulphuretted hydrogen and lead sulphate.—A. S.

Electrodes of Alkaline Secondary Batteries; Process for the Preparation of Active Material for the Negative — from Iron "Hammer-Scale." M. Roloff. *Ger. Pat.* 162,199, Aug. 13, 1903.

FOR the preparation of the active material, only ferro-ferric oxide, Fe_3O_4 , separated from the "hammer-scale" by magnetic means, is employed. It is claimed that plates prepared with the pure magnetic oxide are much superior to those prepared with the crude "hammer-scale," and this difference of quality becomes more pronounced after the cell has been in operation some time.—A. S.

Electrode for Secondary Batteries, composed of Active Material enclosed in a Finely Perforated Casing of Conducting Material. H. Wehrlin. *Ger. Pat.* 162,200, Aug. 23, 1903.

CLAIM is made for the interposition of a membrane (not more than 0.001 mm. thick) of a metal insoluble in the electrolyte, between the active material and the perforated casing. This film of metal closes the fine openings in the casing, but allows the current to pass through without any appreciable difference of potential.—A. S.

Electrode Materials of Badly-conducting Metallic Oxides or Hydroxides; Process for Increasing the Activity of — in Secondary Batteries with Unalterable Electrodes. Kölner Akkumulatorenwerke G. Hagen. *Ger. Pat.* 161,802, Nov. 13, 1903.

THE powdered oxide or hydroxide is intimately mixed with finely-pulverised, chemically-pure graphite, and to the mixture is added crystalline scales of pure graphite. Suitable proportions are:—Nickel hydroxide, 32; chemically pure graphite in powder, 4; and pure graphite in crystalline scales, 14 parts.—A. S.

(B.)—ELECTRO-METALLURGY.

Copper; Distillation of —. H. Moissan. *Comptes rend.*, 1905, 141, 853–857.

COPPER can be readily distilled in the electric furnace; the author has distilled quantities up to nearly 250 grms. When the vapour is condensed on a cold surface, it forms a felted mass of filiform crystals, which has a low density

(8-16), probably due to the presence of occluded gas, but has all the chemical characters of ordinary copper. At the boiling point copper dissolves graphite, and on cooling, the graphite separates in more or less well-defined crystals.—J. T. D.

Lead and Copper; Electrolytic Assay of ——. G. A. Guess. XXIII., page 1325.

Kind of Oil.

32.9	23.3	9.6
45.8	32.5	13.3

* The percentages refer to the weight of oil used for the preparation of the lead salts of the fatty acids.—A.S.

ENGLISH PATENT.

Metallic Wall Coverings; Production of ——. [Electrolytically], and Apparatus therefor. S. O. Cowper-Coles. London. Eng. Pat. 24,904, Nov. 16, 1904.

METALLIC wall coverings are produced by the electro-deposition of a metal upon a cathode, the latter having upon its surface the pattern to be reproduced. A hollow cylinder of lead, or lead alloy, is cast with the pattern upon its outer surface, and the cylinder is then mounted on a mandrel which is partially immersed in an electrolyte, and in which it almost floats. The anode bars are arranged concentrically with and near to the immersed portion of the cathode, and are made adjustable in order to bring them nearer to the drum as they dissolve away. Between the anode bars are located perforated lead pipes connected to a pump, so that a stream of electrolyte is continually directed on to the cathode. The latter is slowly rotated by a revolving supporting trunnion in the upper portion of the tank, suitable cams giving a reciprocating lateral motion to the cathode, so that the whole of the surface is operated upon by the jets of electrolyte. A high current density combined with a low voltage is used, the speed of the cathode being such that the metal is deposited during the passage of the cathode through the electrolyte, and the deposited metal is stripped from the cylinder as it emerges from the electrolyte. The mandrel may be heated with superheated steam, if necessary, so as to produce a rapid "convexular" motion in the electrolyte in contact with the cylinder.—B. N.

FRENCH PATENT.

Furnaces; Impts. in Electric ——. H. Aubry. Fr. Pat. 356,483, July 18, 1905.

This invention relates to the oscillating type of electric furnace supported on trunnions. The latter are placed out of the centre, and a little behind the vertical axis of the furnace, so that the furnace is in a state of unstable equilibrium with a constant tendency to overturn. A bar placed under the furnace engages in hooks fixed to the framework, and maintains the furnace in its normal position.—B. N.

XII.—FATTY OILS, FATS, WAXES, AND SOAPS.

(Continued from page 1232.)

Fatty Oils; Detection of "Blown" ——. in *Mixtures with Mineral Oil*. J. Marcusson. Chem. Rev. Fett-u. Harz-Ind., 1905, 12, 290-293.

AFTER describing the usual methods for the detection of "blown" oils in lubricating oils, the author proposes a method for distinguishing whether the "blown" oil has been prepared from rape oil or cottonseed oil, the two oils

stated to be most commonly used for the preparation of "blown" oils for lubricating purposes. The method is based on the different behaviour of the lead salts of the fatty acids from the two oxidised oils towards ether, and also on the behaviour towards petroleum ether of the fatty acids separated from the lead salts insoluble in ether. Some results obtained by this method are shown in the following table:—

Sodium Palmitate; Hydrolysis of ——. R. Cohn. XXIII., page 1326.

UNITED STATES PATENTS.

Oil; Apparatus for Extracting ——. V. D. Anderson. Cleveland, Ohio. U.S. Pat. 805,112, Nov. 21, 1905.

CLAIM is made for an apparatus combining a grinding-mill, a "tempering trough," in which the material is heated and mechanically agitated whilst being conveyed to the press, an expelling press which works continuously, and means for separating solid matter from the oil as it leaves the press.—C. A. M.

Dissolver [for Soap, &c.]. W. J. Flitton, Chicago, Ill. U.S. Pat. 805,276, Nov. 21, 1905.

THE soap or other substance is placed on a perforated support within a vessel and is dissolved by means of steam from a pipe coil. There is also a pipe for the introduction of water and a float to control the valve, so that the water is maintained at a constant level below the support to receive the dissolved substance. The solution is discharged through a gate or through a pipe communicating with the lower part of a cylinder from which a given quantity may be expelled by means of a piston controlled by a handle.—C. A. M.

FRENCH PATENT.

Hydrosulphurous Acid and another Acid; Preparation and Utilisation of Double Salts of ——. J. Harding. Fr. Pat. 350,189, Sept. 24, 1904. VII., page 1303.

XIII.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(Continued from page 1245.)

(B.)—RESINS, VARNISHES.

Lac Industry of India; The ——. G. Watt. Pharm. J., 1905, 75, 646-652.

THE subject is treated under the following heads:—(1) *History of lac* (including the discovery of cochineal). (2) *Origin of lac*. (3) *The production of lac*. Here it is pointed out that it has not yet been proved whether the old lac from which the larvae have escaped ("phunki") is really inferior to lac containing the larvae, as is generally supposed. The great fluctuations in the price of Indian lac are commented on. It is thought possible that the different grades of lac may be due to different species of insect. (4) *Manufacture of lac*. The twigs encrusted with lac are collected from the trees in May to June, and in October to November; they are known as stick lac, and are dried in the shade, when the wood shrinks, leaving the

lac as hollow tubes to which a certain amount of wood adheres. When crushed and reduced to roundish pieces it is known as seed lac; the dust produced on sifting this is called "khud." The purified seed lac is then washed in stone troughs and left to stand, covered with water, for 24 hours: the wood floats to the top and is removed. A man now enters the trough and presses the lac with his feet against the sides, thus breaking up the lac into finer particles. The water, which is of a deep claret colour, is run off, and the lac is washed again until the washings are colourless. These are evaporated and the residue pressed into cakes, forming lac dye, when this is required. The washed seed lac is sifted into two qualities, dust ("gaud") and granular. The seed lac is occasionally washed or boiled either with a solution of sodium carbonate or with a solution of sodium or potassium carbonate and borax, or with borax alone, or with alum. After several such treatments it is said to become almost white. In most of the larger factories, however, this treatment is dispensed with, the seed lac being simply washed repeatedly with water. In either case the seed lac is spread out on specially arranged floors and exposed to light and air, whereby it is thoroughly dried and further bleached. It is then fused with orpiment or rosin, according to the purpose for which it is intended: the mixture is placed in long, narrow bags, which are placed in front of a long open fire in such a way that they may be twisted whilst being moved slowly along. The top of the bag is twisted round, the bottom being held, so that the fused lac is gradually squeezed through the bag: it is scraped from this with an iron scraper, and allowed to drop on the floor in front of the fire, which is kept cool by sprinkling with water: this is thought to produce some allotropic modification of the lac. If the lac is not sufficiently heated, it is scraped from the floor and returned into the top of the bag. For the manufacture of shellac, a mass of molten lac is spread on a zinc or earthen tube, tilted with hot water, by means of a ribbon of palm leaf, to a thickness of about $\frac{1}{8}$ in. This sheet or skin is now clipped from the tube, trimmed to rectangular form, and stretched in front of a fire, to three or four times its original size, when it is the thickness of tissue paper. It is now laid on a mat and allowed to cool gradually. The sheets are assorted according to colour, and the impurities and darker coloured portions removed. In the production of garnet lac, the sheets are taken from the hot tubes, no further stretching being necessary. For preparing button lac, the molten lac is simply allowed to drop on to a smooth surface. Garnet and button lacs contain no arsenic as a rule. The refuse from the melting bags is made into large circular cakes, which are sold to manufacturers of sealing wax, toys, &c., and to cabinet makers, who use them to cover up cracks in wood. During the five years ending 1903, the average number of factories registered was 102, employing about 7,000 persons. (5) *The uses of lac.* (6) *The trade in lac.* The first recorded exports from India were in 1607; in 1805, 2377 cwt. of shellac, valued at 12,978*l.*, were exported, and the amount increased slowly, being 7226 cwt. of "lac-resin" and 4756 cwt. of lac dye in 1839. In 1868-1869 the value of shellac sent to Europe was about 80,000*l.*, and of lac dye 53,300*l.*, since when the trade in shellac has increased to 1,400,000*l.*, while that of lac dye has disappeared. The bulk of Indian shellac goes to the United Kingdom, and the United States, the amounts shipped to the two countries in 1903-4 being 73,269 cwt., and 81,817 cwt. respectively. (See also this J., 1905, 1134.)—T. F. B.

(C)—INDIA-RUBBER, Etc.

Rubbers from Burmese Climbers. Bull. Imp. Inst., 1905, 3, 230-233.

VERY small quantities of latex from two climbers or vines from Burma were examined.

Ecdysanthera micrantha, A.Dc.—This vine occurs in Southern Asia from Assam to Indo-China and is exploited in the French territories for its rubber. Experiments showed that the latex could be very readily coagulated by the application of gentle heat. A yield of about 25 per cent. of rubber was obtained from the latex and the product appeared to be of very fair quality, free from stickiness, and exhibiting fairly good elasticity and tenacity. The dried rubber showed on analysis:—Caoutchouc, 84.1; resin, 11.5; insoluble matter, 4.4 per cent.

Parameria pedunculosa, Benth.—This vine is stated to yield very good rubber in Java and Sumatra, but the latex received from Burma did not confirm this statement; steps should be taken to verify the identity of the samples. The latex coagulates very shortly after collection; the sample examined was in the form of a pinkish-white curd, drying to a friable powder of very little commercial value. Analysis showed:—Caoutchouc, 10.7; resin, 88.5; insoluble matter, 0.8 per cent., including 0.3 per cent. of ash.—J. F. B.

ENGLISH PATENT.

Rubber and the like; Means and Appliances for Making Articles of — such as Stamps. A. S. Bowley, Putney, and T. W. Hammer, Uckfield. Eng. Pat. 17,239A, Aug. 8, 1904.

Manure; Manufacture of a —. Soc. Aktieselskabet det Norske Kvaestofkompagni. Fr. Pat. 356,077, July 11, 1905.

CALCIUM nitrate is mixed with calcium oxide, or with calcium sulphate, or with equivalent matter, capable of chemically retaining water, and the mixture is calcined to constitute a non-hygroscopic manure, which, when powdered, is readily applicable to the soil.—E. S.

XVI.—SUGAR, STARCH, GUM, Etc.

(Continued from page 1245.)

Carbostyryl as a Deposit in a Vinasse Furnace. E. O. von Lippmann. Ber., 1905, 38, 3829–3830.

IN dismantling a furnace which had been used for the incineration of residues from the recovery of sugar from molasses, a crystalline deposit was found in a deep fissure in the strongly corroded masonry of the flue. Apart from tarry and other substances, the main bulk of the deposit consisted of a crystalline body easily soluble in alcohol and ether. After purification from alcohol, this body was obtained in the form of white prisms, m. pt. 200° C., having a composition corresponding to the formula C_9H_7NO . It was identified as carbostyryl (py-2- α -hydroxyquinoline) by means of its silver compound.

—J. F. B.

Amylum [Starch], Amylodextrin and Erythrodextrin; Behaviour of — towards Chromic Acid. E. O. Harz. Beiheft z. Botan. C. n. tralbl., 1905; through Woch. für Brau., 1905, 22, 721–722.

THE author has studied the action of chromic acid at various concentrations and of mixtures of chromic acid

and sulphuric acid on starch, allowing the materials to remain in contact for 24 hours and then washing off with cold water. The colours obtained with chromic acid alone varied according to the concentration from yellowish greyish green to olive green, and finally golden yellow; the products from the treatment with chromic and sulphuric acid mixtures showed different shades of green. The different kinds of starch varied greatly in their behaviour, as did also the different grades of the same kind of starch. Starch cannot be regarded as a physically uniform substance, consisting of granules differing from each other according to the denser or looser constitution of their ultimate complexes. The nature of the union between chromic acid and starch is analogous to that existing between iodine and starch. The ratio of chromic oxide, Cr_2O_3 , to starch is 1:5.7, corresponding to a stoichiometrical ratio of $(C_6H_{10}O_5)_{587}O_3$. Amylodextrin (soluble starch) showed a similar behaviour to starch, i.e., it did not behave as a uniform substance, but appeared to consist of several kinds of molecular groups differing in the density or complexity of their internal structure. The same was observed with erythrodextrin II., prepared by the action of a 5 per cent. alcoholic solution of hydrochloric acid on starch. Only when the achroodextrin stage of degradation was reached did the starch products approach an apparently uniform state of internal aggregation.—J. F. B.

Gum; Apparatus for Straining —. S. B. Adams, Portland, Me. U.S. Pat. 804,911, Nov. 21, 1905.

THE apparatus consists of a closed retort into which steam can be admitted. Inside the retort is a series of shallow metal trays with perforated bottoms arranged one above the other. The solution of gum is placed in the trays and percolates through the perforations, falling on to conical diaphragms placed between each of the trays, and arranged in such a manner that the gum falling on them flows down the slope and is delivered clear of the system of trays at the sides of the retort, being finally collected at the bottom.—J. F. B.

FRENCH PATENTS.

Saccharine Liquids; Separation of Foreign Matters from the Sugar in —. F. Hlavati. Fr. Pat. 356,631, March 24, 1905.

THERE is added to the diffusing water a quantity of a soluble sulphate, capable of being precipitated by lime, equivalent to the alkali salts present in the juice. After carbonation and saturation, aluminium sulphate is added to the juice until the reaction is acid, together with a quantity of finely divided metal (e.g., aluminium, zinc or iron, &c.) sufficient to convert the aluminium sulphate into the hydroxide. After concentration to a syrup of 20° to 35° B., the liquid is filtered, and an argillaceous material such as bauxite is added, together with barium hydroxide or strontium hydroxide. At the same time, milk of lime is added, and a quantity of an ammonium salt equivalent to the chlorides present in the syrup. The syrup is then saturated with sulphur dioxide, until a filtered sample is no longer rendered turbid, on addition of ammonium oxalate. It is then filtered, and boiled to masseinite. The spun syrup is treated with a sulphate, the base of which is capable of being precipitated by lime or by a finely divided metal [see above], and with the finely divided metal, and when the syrup is decolorised it is mixed with fresh juice. It is explained that when as the

salt employed, this happens to be copper sulphate, then zinc or iron powder will be preferable for subsequent use to remove excess of copper; when aluminium sulphate is used, then the metal may be iron, zinc or aluminium in powder.—J. F. B.

Vegetable Juices; Process and Apparatus for the Continuous Lixivation of Chopped Material for the Extraction of —. C. Steffen. Fr. Pat. 356,636. May 9, 1905.

The apparatus consists of a series of several reservoirs, one behind the other, in which the material is agitated with an excess of liquid. The solid matter is collected and pressed at the exit end of each reservoir by an Archimedean screw which delivers the solid, between press-rolls if desired, into the inlet end of the next reservoir, where it is mixed with a more dilute solvent. The solvent liquid is circulated in each reservoir independently through an external pipe, the liquid being sucked from the exit end and delivered to the inlet end. The excess of liquid from each reservoir is delivered into the next one behind in a counter direction to the passage of the solid material, so that water is fed in at one end of the series and concentrated liquor is discharged at the other.—J. F. B.

Agitating Device, especially for Sugar Solutions. P. Ehrhardt. Ger. Pat. 161,937. Nov. 30, 1904.

THE invention relates to an apparatus for agitating solutions by means of compressed air. It consists in disposing near to and slightly above each outlet, *a* (see Figs.) of the compressed-air tubes, inclined plates *b*, spaces *i* and *o* respectively being left between the plates

Fig. 1.

Fig. 2.

and the tubes, and between adjoining plates or between the plates and the walls of the evaporating vessel. The bottom of the evaporating vessel may be provided with projections *c*, with sides parallel to the inclined plates. The

inclined plates may have the form of movable flaps *b*, or may be united to form one long plate *b'* (Fig. 2), or they may be made funnel-shaped *b''*, *b'''* (Fig. 2).—A. S.

Beet Sugar; Process for Obtaining — without Separation of By-products. W. O. Luther. Ger. Pat. 162,955, Jan. 19, 1905.

THE fresh chips are treated in a hot solution containing tannin, obtained by purification of the mother liquor from the "first product" with excess of tannin substances. The chips are macerated and pressed, and the juice obtained is worked up in the usual manner. In carrying out the process, the mother liquor from the "first product" at a strength of 6°–8° Brix, is mixed with spent tan liquor. The tannin substances are decolorised, and the other soluble constituents of the tan liquor cause a separation of saline substances from the sugar solution. The precipitate is filtered off, and in the filtrate, the beet chips are macerated at a temperature of 85°–90° C.—A. S.

XVII.—BREWING, WINES, SPIRITS, Etc.

(Continued from page 1218.)

Yeast; Quantitative Action of Poisonous Substances on —. T. Bokorny. Allg. Braner- und Hopfen-Zeit., 1905, 1053. Z. Spiritusind., 1905, 28, 445.

THE quantities of various poisons necessary for killing 20 grms. of yeast are as follow: formaldehyde, 0.05–0.1 gm.; sulphuric acid, 0.05–0.1 gm.; lactic acid, 0.1–0.2 gm.; sulphurous acid when allowed to act for 24 hours, either in 0.1 or 0.01 per cent. solution, 0.002 gm.; hydrofluoric acid, 0.02–0.05 gm.; sodium fluoride, more than 0.05 gm.; copper sulphate, 0.002–0.005 gm.; mercuric chloride, about 0.006 gm. The effective degrees of dilution of the individual poisons vary between 0.1 and 0.00001 per cent. The poisoning action depends upon a quantitative chemical reaction, in which the albumin of the plasma of the yeast cell combines with the poison, and thus loses the properties of living matter; the death of the cell takes place when a certain proportion of the plasma has undergone this change.—T. H. P.

Acetifying Bacteria; The Oxydase of —. E. Buchner and R. Gaunt. Woch. für Brau., 1905, 22, 709–710.

THE production of acetic acid from alcohol is effected by an oxidising enzyme secreted by the acetifying bacteria, and capable of exerting its specific activity after the death of the cells (see this J., 1903, 374 and 1905, 981). The authors have made a further study of this enzyme, working with preparations made chiefly from *B. acti*, Hansen, by the acetone process ["*Daueressighakterien*"]. The bacteria were cultivated in diluted wort containing 4 per cent. of alcohol and 1 per cent. of acetic acid. This liquid was infected by means of a culture of the organism in beer, and incubated at 28° C. The bacterial growth was separated and washed in a centrifugal machine: it then contained 70 per cent. of moisture. This product was either treated with acetone direct or else dried first on porous plates, and then treated with acetone. In the former case entire freedom from living organisms is ensured, but the enzyme is not very active, whereas in the latter case, the enzyme is about four times more active, but a few living cells survive. The experiments were conducted by adding 15–20 grms. of the "Dauer" preparations to a 4 per cent. solution of alcohol in presence of calcium carbonate and excess of toluene; a current of sterilised air was supplied, and the mixtures were maintained at 30° C. for three days. Yields of acetic acid ranging from 0.08 to 0.35 gm. of acetic acid were obtained from the different preparations. Similar experiments with propyl alcohol showed that propionic acid was produced by the same enzyme. Preparations made from bacteria cultivated in beer were found to be inactive, owing probably to the defective nutrition afforded by that medium.

—J. F. B.

Sarcina; An Obligatory Anaerobic Fermentation —. W. Beijerinck and N. Gosling. *Verhandl. K. Akad. Wiss.* Amsterdam, 1905; through *Z. Spiritusind.*, 1905, 28, 435.

THE authors have prepared pure cultures of an organism which they regard as identical with *Sarcina maxima* and have studied its properties. In order to isolate this, bouillon containing 3–10 per cent. of dextrose or malt wort is acidified with phosphoric acid until the total acidity corresponds to about 8 c.c. of N/1 acid per 100 c.c. A bottle, in which a layer of 5–7 mm. of finely sifted garden soil has been placed, is then filled up to the top with the culture liquid, and is closed by a cork with a small hole. The preparation is incubated at 37° C.; fermentation starts after 12 hours and continues for 24–36 hours. The sedimentary layer shows a nearly pure growth of packet *sarcina*. The individual cell elements measure 3.5 μ in diameter, and show the cellulose reaction; the packets are irregular in form. A mucous scum is formed during fermentation, consisting of matter eliminated from the cell walls. The gas evolved is a mixture of 75 per cent. of carbon dioxide, and 25 per cent. of hydrogen; no methane is formed. A considerable quantity of acid is produced—a liquid starting at 6 c.c. of normal acid per 100 c.c. finished at 12 c.c.—if this acid, as is probably the case, should prove to be lactic acid, this N/1 is by far the most powerful lactic acid ferment yet known. It is essential that the quantity of air should be very restricted, but a little air lends vigour to the cells. This *sarcina* will grow in media containing no acid; the high proportion of acid in the medium, the high temperature of incubation, and the exclusion of air ensures the practical purity of the cultures. The development of acid destroys the power of growing sub cultures; these must, therefore, be taken before fermentation has ceased. This *sarcina* is probably identical with the intestinal *sarcina*.

—J. F. B.

Sarcina; Notes on Beijerinck's Paper on a Strictly Anaerobic —. P. Lindner. *Z. Spiritusind.* 1905, 28, 435. (See preceding Abstract.)

THE author has not found that *Sarcina maxima* gives the cellulose reaction, though this is furnished by *S. ventricula*; but has observed that the organism appears in greater numbers when the access of air to the medium is checked. Neither has he succeeded in detecting it in lactic acid mash at 40–45° C., its development being probably prevented by the presence of air. He does not consider it proved that the fermentation recorded is really due to the large cells, nor that this form can be changed into small cells, having found that the packets gradually break up into their component cell, the lustre of which is then masked by a highly granular structure.—C. S.

Fermentation Squares; Large Cement —. W. Windisch. *Woch. f. Brau.* 1905, 22, 645–646.

HITHERTO it has been the custom in Germany to use only wooden fermentation tuns of relatively small size; recently, however, Doornkaat has been working very successfully with large cement squares constructed in the following manner.—The standing masonry of the building is covered with well tarred cork plates nailed to the mortar; the concrete walls of the vat are then built against this elastic layer. The walls of the vat are constructed of iron rods embedded in a concrete composed of river pebbles, sand and cement; a similar concrete is stamped on the foundation prepared for the bottom of the vat. The whole of the inside of the vat is covered with a layer of pure cement so worked with the trowel that it presents a perfectly smooth, non-porous surface. The cement vat is kept moist for 14 days, and then full of water for four weeks. After that it is emptied and dried by the careful application of a hand soldering lamp until the whole vat is warm to the touch. Then melted paraffin, at a temperature of 120° C., is applied all over with a brush, the paraffin is driven into the pores of the cement by fusion with the hand lamp, then a second coat is applied, and finished off smooth with the lamp.—J. F. B.

ENGLISH PATENTS.

Malt Kilns; Impts. in —. J. Hornof, Hollerschau, Austria. Eng. Pat. 22,704, Oct. 21, 1904.

THE green malt is fed through a hopper, 7, into the cleansing drum 9 (Fig. 2), consisting of an annular space between two perforated cylinders, this space being divided

up by four radial partitions. In the compartments so formed are disposed a large number of perforated inclined surfaces attached to both the cylindrical walls and so arranged that, during the rotation, the malt is thrown alternately from the inner surface of the annular space to the outer surface and back again, receiving simultaneously a forward shovelling motion. This drum is surrounded by a casing into which hot air from the kiln is delivered. The green malt thus broken up and thoroughly prepared, then passes by the pipe 40 into the kilning drums proper, 16–20 (Fig. 1). These consist of four series of four superposed drums diminishing in diameter from the top to the bottom of the series, only one series being shown in the figure. They are constructed internally on the same principle as the cleansing drum, the malt being tossed to and fro and shovelled forward from the inlet to the outlet of each drum, the walls of which are perforated. The drums are situated in a casing, as shown, and the malt is exposed to an ascending current of hot air heated by the coils 22; a temperature regulator 18, divides the curing drums from the drying drums, and serves for the admission of cool air. The perforations in the last drum 20 are

made large enough to allow the germs to pass through; the malt is delivered by the pipe adjoining 53, and entering it below, and the germs by the pipe 53.—J. F. B.

Malt; Art of Producing — W. P. Rice, Chicago. Eng. Pat. 14,103, July 8, 1905.

THE steeped grain is spread in layers of suitable depth on superposed, closely spaced shelves, several of which form what is termed a malting unit. Air passages are provided on opposite sides of a row of malting units by which air is delivered to and withdrawn from the grain disposed on the shelves; the latter may also be perforated, and the air may be drawn through the bed of grain. The trays are constructed to be drawn out from the unit and to empty their contents automatically outside for redistribution on the same or other trays, or else on a conveyor which transports the grain to the drying units, which are constructed on a similar principle.—J. F. B.

Brewing; Art of — J. Schneible, Weehawken, U.S.A. Eng. Pat. 15,250, July 25, 1905. Under Int. Conv., Aug. 1, 1904.

SEE U.S. Pat. 799,407 of 1905: this J., 1905, 1079.—T.F.B.

Beer; Non-alcoholic Beverages resembling — K. Scholvien, Mühlhausen, Germany. Eng. Pat. 16,478, Aug. 14, 1905. Under Int. Conv., Aug. 13, 1904.

A STERILE wort of 8 per cent. strength, which may be either hopped or unhopped, is inoculated with a pure culture of *Citromyces* in a sterilised and closed vessel, the liquid is stirred and maintained, with the exclusion of air, at a temperature of about 18° C. until the fungus is sufficiently developed. At this stage the liquid has the aroma of beer and contains only a little citric acid. It may then be impregnated with carbon dioxide and filtered and may be pasteurised if desired. The fungus spores are obtained from lemons.—J. F. B.

Drying Gelatin, Glue, Paste Goods, Brewers' Grains, Bricks, Woods, Metal Articles and the like; Apparatus for — O. Koepff. Eng. Pat. 5748, March 18, 1905. I., page 1291.

UNITED STATES PATENTS.

Grain; Method of Drying and Roasting — V. Lapp. Leipzig, Germany. U.S. Pat. 805,367, Nov. 21, 1905.

THE grain is placed in a suitable drying chamber on a metallic grid and a current of heated air is introduced from above and withdrawn by suction through the grain from below. This direction of the air current is maintained for the first two-thirds of the whole operation, after which the current of hot air is passed in the reverse direction for the remaining one-third of the time. During this latter period, external heat is applied to the floor of the apparatus in order to facilitate the roasting of the grain. The condensation of moisture on the walls of the chamber is minimised by regulating the temperature of the walls by means of external heating coils.—J. F. B.

Brewing Apparatus. C. Rach, New York. U.S. Pat. 804,979, Nov. 21, 1905.

THE brewing apparatus consists of two vessels and a "diastase kettle," each provided with means for heating and means for applying pressure. Two pipes are arranged, each having a series of valved branches connecting the body of one vessel with the top of the other vessel, and also with the top of the diastase kettle; valved pipes also connect the bottom of the kettle with the tops of the two vessels. There is also a filtering tub and a valved branch from each of the pipes to the filtering tub.—J. F. B.

FRENCH PATENTS.

Grain; Process and Apparatus for Malting — Berliner A. G. für Eisengiess. u. Maschinenfab. Fr. Pat. 356,234, July 19, 1905.

IN malting, the germination or development of the radicles and plumules is suspended without arresting the action of the enzymes, so that an intermediate phase, called "the

phase of modification of the grain," is inserted between the germination proper and the removal of the moisture and the withering of the germs. This phase is obtained by shutting off the supply of fresh air and substituting a supply of a mixture of carbon dioxide and air whilst cooling to the desired temperature. A suitable mixture is present in the apparatus at the end of the germination; this mixture is circulated several times through the apparatus and is cooled each time before being returned through the grain.—J. F. B.

Malting Grain for Use in Brewing; Preparation of — J. Schneible. Fr. Pat. 356,399, July 25, 1905. Under Int. Conv., Aug. 1, 1904.

SEE U.S. Pat. 799,407 of 1905: this J., 1905, 1079.—T.F.B.

Carbonic Acid [of Fermentation]; Process and Apparatus for the Solidification of — H. S. Elworthy. First Addition, of March 27, 1905, to Fr. Pat. 355,503, of Jan. 31, 1905 (this J., 1905, 1231).

THE application of the process and apparatus described in the main patent is especially claimed in respect to the carbon dioxide gas hitherto wasted, occurring in processes of fermentation, the manufacture of yeast, &c., which, by the process of solidification, is rendered readily transportable.—E. S.

Spirits [Eaux-de-vie] from Beetroots; Manufacture of Fine — E. A. Barbet. Fr. Pat. 350,196, Sept. 28, 1904.

BEET juice is purified in exactly the same manner as is employed in the manufacture of sugar. The boiled massecuite is drained in a centrifugal machine of special construction, which is closed and in which provision is made for collecting the spun syrups separately. The crude molasses are denitrated and fermented to produce industrial spirits. The claire syrups are returned to the vacuum pan. The purified sugar is dissolved in the centrifugal itself by means of water boiling under pressure at a temperature of 110°–120° C. This pure syrup is mixed with vinasses from the distillation of good, genuine wines, and is fermented by pure cultures of high-quality wine yeasts. The fermented wash is distilled in brandy stills without rectification, and constitutes an artificial brandy. An alternative method for purifying the beet juice by means of lead acetate, followed by sulphitation, is described, in which case it is not boiled to massecuite.—J. F. B.

XVIII.—FOODS; SANITATION; WATER PURIFICATION, & DISINFECTANTS.

(Continued from page 1250.)

(A.)—FOODS.

Casein; Glycocoll and Alanine from — Z. H. Skraup. Monatsh. f. Chem., 1905, 26, 1343–1349.

THE earlier statements by the author (see this J., 1904, 619; 1905, 338) that among the products of hydrolysis of casein and gelatin are diaminoglutaric and diaminoadipic acids have been found to be incorrect. The compounds isolated are really glycocoll and *d*-alanine respectively. Further experiments have now given the surprising result that whilst one commercial specimen of pure milk-casein (Merck) yields more glycocoll than *d*-alanine, another (Meister, Lucius und Brünig) yields *d*-alanine but no glycocoll among the products of hydrolysis.—A. S.

Formaldehyde and [Organic] Nitrogen Compounds containing Oxygen; A Very Sensitive Reaction of — which is also a Colour Reaction for Albuminoid Substances. E. Voisenet. XXIII., page 1326.

ENGLISH PATENTS.

Eggs and Egg-containing Substances in Dry Form, and Process for Obtaining same. J. R. Hatmaker, Paris. Eng. Pat. 28, Jan. 2, 1905.

Eggs, parts of eggs, or mixtures of the same with other substances, may be obtained in a dry, sterile, porous form by exposing them in a very thin film upon a suitable surface, heated to a temperature above 212° F., such as the hot roller apparatus described in Eng. Pat. 8743 of 1903 (this J., 1903, 815).—W. P. S.

Malt Food; Manufacture of a —. S. Fränkel, Strassburg, Germany. Eng. Pat. 6457, March 27, 1905.

KILNED malt is freed, with as little loss of farinaceous substance as possible, from its sharp points; it is then treated, after superficial wetting, in suitable beard-removing and polishing apparatus, so as to remove as much husk as possible, leaving only sufficient to maintain the cohesion of the farinaceous substance of the grain. The malt is then heated in a moist state at a temperature between 37° and 70° C. in order to produce a partial conversion of the starch into sugar. The prepared malt is then rapidly heated in a steam digester at a temperature of 110° C., so as to render the albumin and starch soluble and to agglutinate the latter. The product is finally dried and used as a foodstuff.—J. E. B.

Dehydrating Animal and Vegetable Substances [Foodstuffs]; Process and Apparatus for —. E. W. Cooke and J. F. Kelly, New York. Eng. Pat. 14,854, July 19, 1905.

THE materials are dehydrated by passing the trays on which they are placed, intermittently and at predetermined intervals through a series of chambers. The chambers are separated by partitions provided with openings through which the trays pass, the openings having flexible flaps to close the space. The distance between successive partitions is equal to the length of one or more of the trays. A current of heated air, delivered into each chamber, alternately above and below the trays, passes through the material and leaves by an opening also alternately above and below. The temperature of the air can be controlled by the admission of cold air through a damper placed at the inlet to each chamber.—W. H. C.

Dehydrating Animal and Vegetable Products [Foodstuffs]; Process and Apparatus for —. E. W. Cooke and J. F. Kelly, New York. Eng. Pat. 14,855, July 19, 1905.

THE invention is similar in character to the preceding, with the exception that the current of warm air is passed alternately backwards and forwards through the whole series of chambers except the last, which is fed with a fresh supply of warm air.—W. H. C.

FRENCH PATENTS.

Gluten; Process and Apparatus for Drying and Bleaching —. L. A. Morel. First Addition, dated July 6, 1905, to Fr. Pat. 344,631, July 6, 1904 (this J., 1904, 1232).

THE process described in the original specification is arranged so that the water in the gluten is frozen before it is evaporated. The gluten is placed in moulds on metal plates under the receiver of a vacuum pump, vessels containing a water-absorbing substance, e.g., sulphuric acid being also present. The pressure is reduced to 1–0.5 mm., which causes the mass of gluten to expand and become spongy. At the same time, the rapid evaporation and absorption of the aqueous vapour, causes such an absorption of heat that the water in the gluten congeals, and the mass assumes the appearance of snow. Heat is then applied by electrical resistances beneath the plates, and the further evaporation takes place with such rapidity that the conversion of the water from the solid to the gaseous state is practically instantaneous, and the gluten is dried without losing its snowy consistency.—J. E. B.

Flour; Process and Apparatus for Treating — with Carbonic Acid or other Gaseous or Mixed with an Oxidising or Disinfecting Agent. M. A. Eybert and C. P. Eybert. First Addition dated July 18, 1905, to Fr. Pat. 343,179, April 10, 1904 (this J., 1905, 1027.)

AN inert gas such as carbon dioxide, or air, pure or mixed together, is aspirated through drying chambers containing quicklime and calcium chloride, then through filtering pipes surrounded by cold water, and is then distributed to the various machines in the flour mill. If desired, a gaseous bleaching agent may be mixed with the current of gas. The various operations being performed in a cold dry atmosphere, yield flour of better quality than usual.—J. E. B.

Drying Vegetable Foodstuffs; Process for —. E. Zündel-Donati. Fr. Pat. 356,335, July 22, 1905.

THE materials to be dried are placed on trays or sieves arranged in tiers in a chamber, which is heated and through which a current of cool air is passed. The materials are thus exposed to the action of both heat and cool air at the same time, and many valuable properties are said to be retained.—W. H. C.

FRENCH PATENT.

Water; Process and Apparatus for Purifying —. American Water Purifying Co. Fr. Pat. 356,762, Aug. 8, 1905.

THE apparatus described, serves for the preparation of distilled water on the multiple effect principle. Steam from a boiler is purified in a coke tower and passed into a series of generator and condenser vessels, in which constant differences of temperature and pressure are maintained by means of automatic valves. The supply of crude water may be arranged either in parallel or in series. The steam from each generator is condensed in the succeeding generator in such a manner that its gaseous impurities are obliged to escape from the condensation chamber, and the absorption of volatile impurities is prevented by maintaining the surface of the condensed water at a maximum temperature by direct contact with steam. The steam from each generator is purified by coke, and the cooled distilled water is finally passed through wood charcoal.—J. E. B.

(C.)—DISINFECTANTS.

UNITED STATES PATENT.

Paper Characterised by its Impervious Nature and Strength. C. I. Goessmann, Worcester, Mass. Assignor to Vellumoid Paper Co., Amherst, Mass. U.S. Pat. 804,898, Nov. 14, 1905.

PAPER is impregnated with a glutinous substance treated with formaldehyde, which "sets" before drying. After drying, the paper is softened or "tempered" by hydration.—J. F. B.

FRENCH PATENTS.

Papermaking; Elimination of the Colouring Matters of Plants previous to Bleaching for — A. Badoil. Fr. Pat. 350,221, Oct. 14, 1904.

THE stems of plants, more especially those of the daffodil, which present a problem similar to but more simple than that of ramie, are passed through decorticating machines with smooth rollers. The cortex has an immediate industrial value. The fibres, containing about 40 per cent. of non-fibrous matter, are treated with alkali, preferably in the cold, or are boiled under pressure with a lye containing about 20 per cent. of their weight of caustic soda.—J. F. B.

Size for Paper; Manufacture of — A. Mitscherlich. Fr. Pat. 356,269, June 15, 1905.

A SMALL proportion of rosin (about 17.5 per cent. of the total quantity it is intended to employ) is dissolved in the whole of the sodium carbonate to be employed. In this solution, or else in a solution of the sodium carbonate without the rosin, horn shavings are dissolved at a temperature below 100° C. In order to prevent the colour becoming too dark, sulphurous acid or a sulphite is added during the process of solution. Lastly the remainder of the rosin is incorporated with the size. This size is added to the pulp, and is precipitated there by waste sulphite wood liquor. This liquor is prepared by neutralising the crude liquor with sodium carbonate, concentrating the solution to a suitable degree and adding sodium sulphate equivalent to the calcium and magnesium salts present. In order to obtain a paler colour, it is advantageous to treat both the size and the wood liquor with zinc dust.—J. F. B.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

(Continued from page 1255.)

Abies alba Cones, Essential Oil of — Schimmel's Report, Nov., 1905, 59.

THE essential oil distilled from the fresh cones of *Abies alba* had the following characters:—Sp. gr. 0.8551 at 15° C.; $\alpha_D = -76^\circ 58'$; ester value, 2.44, equivalent to 0.85 per cent. of bornyl acetate; solubility in 90 per cent. alcohol, 1:7 and more.—J. O. B.

Artemisia frigida, *A. leudoviciana*, and *A. caudata*; Essential Oils of — A. Rabak. Pharm. Review, 1905, 23, 128; through Schimmel's Report, Nov., 1905, 12—13.

Artemisia frigida oil.—The fresh herb, collected in South Dakota in August, yielded 0.41 per cent. of a greenish essential oil, with an odour of cineol. Sp. gr. 0.927 at 22° C.; $\alpha_D = -24^\circ 48'$; acid value, 1.2; ester value, 31.8. The dried herb yielded only 0.07 per cent. of a darker oil; sp. gr. 0.930 at 22° C.; acid value, 4.7; ester value, 40. The aqueous distillate accompanying the latter oil gave, when shaken out with light petroleum spirit, a further quantity of darker oil, having the sp. gr. 0.916 at 22° C.; acid value, 5.3; ester value, 25.

Artemisia leudoviciana oil.—The fresh herb yielded 0.38 per cent. of greenish-yellow, aromatic essential oil; sp. gr. 0.929 at 22° C.; $\alpha_D = -16^\circ 14'$; acid value, 4; ester value, 10.

Artemisia caudata oil.—The fresh herb yielded 0.24 per cent. of yellow essential oil with a sweetish odour, indicating the presence of methyl-chavicol or of anethol:—Sp. gr. 0.920 at 22° C.; $\alpha_D = -12^\circ 30'$; acid value, 0; ester value, 17.—J. O. B.

Betula lenta [Sweet Birch] and *Gaultheria procumbens* [Wintergreen]; Essential Oils of — E. F. Ziegeimann. Schimmel's Report, Nov., 1905, 71—72.

As both drugs yield the essential oil through the action of a ferment on a glucoside, it is found that maceration in water for 12 hours previous to distillation gives a better yield, in both cases, than when distillation is performed at once.

Wintergreen oil.—When distilled in small quantities, a yield of 1.57 per cent. was obtained. With large quantities, only 0.633 per cent. resulted, of which 0.288 per cent. was obtained direct and 0.344 per cent. by cohobation; sp. gr. 1.175 to 1.185; esters, 96.20 to 97.13 per cent.

Sweet birch bark oil.—Small quantities of bark gave 0.62 per cent.; on the large scale 0.306 per cent. was obtained direct and 0.076 by cohobation; sp. gr. 1.1502 to 1.171; esters, from 90.2 to 97.83 per cent.

The oils are alike in their solubility in alcohol.—J. O. B.

Citronella; Essential Oil of — Adulterated with Alcohol and with Lemon Oil Terpenes. Schimmel's Report, Nov., 1905, 19—20.

A SPECIMEN, suspected of sophistication from its low sp. gr. was found to be adulterated with 11.2 per cent. of alcohol, as shown by treatment with brine solution.

Another sample, containing only 29.6 per cent. of geraniol, and having the sp. gr. 0.8852; $\alpha_D = +11^\circ 44'$; $n_D^{20} = 1.47235$, insoluble 1:10 in 80 per cent. alcohol, was found to be adulterated with lemon oil terpenes.—J. O. B.

Citronella and Patchouli Oils from Perak (Malay States). Bull. Imp. Inst., 1905, 3, 226—230.

Citronella oil.—This oil had a pale yellow colour and the characteristic odour of citronella; it was valued at about 2s. per lb. The chemical examination, recorded below, shows that it more nearly resembles the Javan oil than the Ceylon oil:—Sp. gr. at 15° C., 0.8948; index of refraction at 24° C., 1.4858; rotation in 100 mm. tube at 24° C., $-1^\circ 34'$; soluble in an equal volume (or more) of 80 per cent. alcohol; geraniol, 32.7 per cent.; citronella (by difference) 55.3 per cent.

Patchouli oil.—The sample had a dark yellow colour, and possessed the strong persistent odour of patchouli. Commercial valuation showed that it was of fairly good quality and probably worth about 16s. per lb. at the present rates. Chemical examination showed. Sp. gr., 0.9525; rotation in 100 mm. tube = $-43^{\circ} 31'$; refractive index, 1.5063; soluble in 7.4 times its volume of 90 per cent. alcohol.—J. F. B.

Patchouli Oil [*Change of Characters on Keeping*]. J. Rodié. Chem. Zeit., 1905, 29, Rep. 92; Schimmel's Report, Nov., 1905, 52.

IN the course of time patchouli oil undergoes considerable changes, from which it becomes more valuable for use in perfumery, since the odour improves and the solubility in 80 per cent. alcohol increases.—J. O. B.

Erigeron canadense; Essential Oil of —. F. Rabak Pharm. Rev. i w, 1905, 23, 81; through Schimmel's Report, Nov., 1905, 23—24.

Essential oil of the fresh herb.—Fresh Canadian brewed yielded 0.66 per cent. of bright yellow essential oil with a peculiar odour recalling that of caraway. It had the following characters:—Sp. gr. at 22°C , 0.8614; $\alpha_D = +67^{\circ} 16'$; acid value, nil; ester value, 108; acetyl value, 180; aldehyde, calculated as citronellal, 0.77 per cent. On exposure to the air, the oil formed crystals, which were recrystallised from alcohol.

Essential oil of dried herb.—The yield from the dry herb was 0.26 per cent. of a darker coloured oil than the above, with a powerful aromatic odour. It gave no crystals when left exposed to the air. It had the following characters:—Sp. gr. at 22°C , 0.8610; $\alpha_D = +76^{\circ} 37'$; acid value, 0; ester value, 52; acetyl value, 86; aldehyde, calculated as citronellal, 0.44 per cent. Free alcohols were present only in the oil of the dried herb, and calculated as terpineol were equivalent to 10.9 per cent. This supports the view that the terpineol found in *Erigeron* oil is a decomposition product.—J. O. B.

Eryngium campestre; Essential Oil of —. Schimmel's Report, Nov., 1905, 73.

THE oil distilled from fresh plants in the South of France, was obtained in a yield of 0.088 per cent. The colour is faintly yellow and the odour pleasant, recalling that of ambrette [*Hibiscus abelmoschus*] seeds; sp. gr. 0.9043 at 15°C ; $\alpha_D = -5^{\circ} 42'$; $n_D^{20} = 1.48518$ ester value, 10.47; solubility in 90 per cent. alcohol 1:1 and more; with 80 per cent. alcohol, insoluble 1:10.—J. O. B.

Ginger; Essential Oil of African —. Schimmel's Report, Nov., 1905, 38—39.

IN addition to the known constituents of this oil, cineol, e tral, borneol, and another alcohol, probably geraniol, are also found to be present.—J. O. B.

Lavandula stœchas; Essential Oil of —. Schimmel's Report, Nov., 1905, 40.

THE dried flowers of *Lavandula stœchas* have yielded 0.755 per cent. of yellowish-brown oil with a camphoraceous odour; sp. gr. 0.9020 at 15°C ; $\alpha_D = +35^{\circ} 30'$; $n_D^{20} = 1.47909$; acid value, 5.16; ester value, 13.1; solubility in 70 per cent. alcohol 1:2, the solution becoming opalescent on dilution, owing to separation of paraffin. It contains dextro-camphor.—J. O. B.

Lemon Oil; Californian —. Schimmel's Report, Nov., 1905, 28.

IT is possible that California may, in course of time, become a centre for the commercial production of lemon oil. A specimen of hand-pressed oil of good aroma from ripe Californian lemons had the following characters:—Sp. gr., 0.8598; $\alpha_D = +55^{\circ} 56'$; α_D of the first 10 per cent. fraction = $+48^{\circ} 42'$; $n_D^{20} = 1.47490$; residue on evaporation, 3.6 per cent. It is possible that the relatively low optical rotation of the oil may be due to the ripeness of the fruits from which it was derived.—J. O. B.

Lemon Grass; Essential Oil of —. Adulterated with Coconut Fat. Schimmel's Report, Nov., 1905, 44.

TWO specimens of lemon grass oil have recently been met with adulterated with 10 and 15 per cent. of coconut fat. J. O. B.

Pinus montana; Adulteration of the Essential Oil of —. Schimmel's Report, Nov., 1905, 50.

A SPECIMEN of cheap oil of *Pinus montana* has been found to be largely adulterated with American turpentine oil, 34 per cent. of it distilling up to 160°C . at normal pressure. With the pure oil, practically nothing distills at that temperature.—J. O. B.

Sage; Essential Oil of Large-leaved —. O. Wallach. Nachr. Kais. Ges. Wiss. Göttingen, 1905 [1], 1; through Schimmel's Report, Nov., 1905, 62.

THE essential oil of the large-leaved sage contains no thujone, differing in this respect from the oil of the common sage, *Salvia officinalis*, which contains dextro- α - and dextro- β -thujone. On the other hand, it yields much kevo-camphor, as well as pinene, cineol, and on treatment with nitrous acid, a crystalline body, m. pt. $85-86^{\circ} \text{C}$., which differs from the known phellandrene nitrites.—J. O. B.

Sandal Wood Oil; Optical Rotation of East Indian —. Schimmel's Report, Nov., 1905, 61.

ALTHOUGH hitherto the minimum optical rotation for pure sandal-wood oil has been given as -17° , a large bulk of wood has lately yielded oil having the $\alpha_D = -16^{\circ} 30'$. The higher rotation can therefore no longer be insisted on as the limit.—J. O. B.

Turpentine; Indian —. from *Pinus longifolia*. F. Rabak. Pharm. Review, 1905, 25, 229; through Schimmel's Report, Nov., 1905, 68.

INDIAN turpentine is white, opaque, viscid and granular, probably from separation of crystals of a resin acid; its odour is pleasant, recalling that of limonene. It yielded 18.5 per cent. of oil on steam distillation; the oil had the odour of pinene and of limonene. The oleoresin had the following characters:—Sp. gr., 0.960; $\alpha_D = -7^{\circ} 42'$; acid value, 129; ester value, 11. The essential oil had the sp. gr. 0.866; $\alpha_D = +2^{\circ} 48'$. On fractionation at normal pressure, 56 per cent. passed over between 165° and 170°C ; 20 per cent. from 170° — 175°C ; 9 per cent. at 175° — 180°C , and 15 per cent. at 180° and higher. The resin showed $\alpha_D = -1^{\circ} 11'$ [100 mm. tube, 10 per cent. solution]; acid value, 142; ester value, 13.—J. O. B.

Terpenes and Essential Oils; 73rd Communication. [Methene Compounds and 3-Phellandrene.] O. Wallach. Annalen, 1905, 343, 28—40. (See this J., 1905, 749.)

THE name methene is proposed for the methylene group (CH_2) in a semi-cyclic grouping as it differs in its behaviour from methylene in other hydrocarbons. β -Phellandrene is an example of a methene compound:—

and would be named Δ_3 -methene-(1)-isopropyl-(4)-cyclohexene or methene-(1)-isopropyl-(4)-tetrahydrobenzene. β -Phellandrene was oxidised by shaking with water and oxygen for several days. From the oxidation product a semi-carbazone, m. pt. 183° — 184°C . was produced. This, on decomposition, yielded an unsaturated ketone, $\text{C}_9\text{H}_{14}\text{O}$ boiling between 103° and 106°C . at 15 mm., and between 220° and 224°C . at ordinary pressure, with sp. gr. 0.9387, and $[n]_D = 1.4788$ at 26°C . With hydrogen sulphide it formed an addition compound soluble in chloroform and melting at 121° — 122°C . This ketone was reduced with sodium in alcohol to a saturated alcohol. This was cautiously oxidised with permanganate and a semicarbazone, $\text{C}_9\text{H}_{16}\text{N}_2 \cdot \text{NH} \cdot \text{CONH}_2$, melting at 188°C was isolated. The ketone from this was oxidised with chromic acid and yielded crystals of β -isopropyladipinic acid, $\text{C}_9\text{H}_{17} \cdot \text{CH}(\text{CH}_2 \cdot \text{COOH}) \cdot \text{CH}_2 \cdot \text{CH}_2 \cdot \text{COOH}$, melting at 70°C . The author considers that in the first stage of the gaseous oxidation, two atoms of oxygen become attached to the methene group to form a superoxide, which decom-

poses into the ketone. With permanganate a glycol is formed in the first stage of the oxidation. An attempt was made to prove the presence of 3-phellandrene in the oil of *Eucalyptus amygdalina* by oxidation with gaseous oxygen, but no satisfactory evidence of its presence was obtained. It is clear that tetrahydrocuminic aldehyde is a natural constituent of water-fennel oil, and is not an oxidation product due to the air.—F. S.

Terpenes and Essential Oils. 74th Communication.
O. Wallach. *Annalen*, 1905, **343**, 40—53.

This article relates to a study of cyclohexanone, the work being treated under the following headings:—(1) Bromine substitution products of cyclohexanone; (2) cyclohexanone-isoxime and its reduction products; (3) hexene acids from α -leucine; (4) cyclohexene-(tetrahydrobenzene-)nitroso-chloride; (5) synthetic preparation of 1,2-methylcyclohexanone; (6) cyclohexene-acetic acid.

—A. S.

Terpenes and Essential Oils. 75th Communication. Conversion of Ketones and Aldehydes into Bases. O. Wallach with K. Hüttner, and J. Altenberg. *Annalen*, 1905, **343**, 54—74.

It was shown by Leuckart (*J. prakt. Chem.*, 1890, **41**, 330) that on heating ketones or aldehydes with ammonium formate, bases, generally as formyl compounds, were produced. The authors consider that at a high temperature (100°—200° C.) the ammonium formate dissociates into ammonia and the free acid. The ammonia, attaches itself to the carboxyl group and the hydroxyl thus formed is reduced by the formic acid:—

The reaction is complicated by the fact that the primary bases formed, react upon the still unchanged ketone or aldehyde, producing a mixture of secondary and tertiary bases. The production of this mixture can be avoided and the reaction controlled by the presence of a free acid such as formic or acetic acid during the reaction. Instead of ammonia, salts of primary or secondary substituted bases can be used, thus giving a new and direct method for the production of secondary and tertiary bases. As the temperature of the reaction is lower, the bases are obtained as salts with aliphatic compounds. But with aromatic compounds the bases usually appear as their formyl derivatives. Quaternary bases are not produced in these reactions. The following examples show the applicability of the reaction. Benzylcyclohexylamine can be formed in two ways (1) By heating benzaldehyde with hexylamine formate in the presence of acetic acid. (2) By heating hexanone with benzylamine formate. Mono-ethylbenzylamine can be formed by heating benzaldehyde with ethylamine formate; benzylpiperidine by heating benzaldehyde, piperidine and formic acid. The formyl compound of menthylamine is produced by heating menthone and ammonium formate with some acetic acid.—F. S.

Fenchone Semicarbazone. O. Wallach. *Nachr. K. Ges. Wiss. Goettingen*, 1905 [**1**], 6; through Schimmel's Report, Nov., 1905, 115.

FENCHONE semicarbazone, which has not been obtained directly before, is thus prepared. Ten grms. of semicarbazide hydrochloride and 10 grms. of sodium acetate are dissolved in 20 c.c. of water, and mixed with a solution of 10 grms. of fenchone in 50 c.c. of alcohol. The mixture is set aside for at least a fortnight, then steam distilled, when the semicarbazone remains as the non-volatile residue. It crystallises well from dilute alcohol; it softens at 174° C. and melts at 182° C. A racemic mixture of dextra- and levo-fenchone semicarbazones crystallises less readily.—J. O. B.

Caryophyllin. H. Meyer and O. Hoenigschmid. *Monatsh. Chem.*, 1905, **26**, 379; and J. Herzog. *Ber. Pharm.*, 1905, **15**, 121, through Schimmel's Report, Nov., 1905, 20—22.

H. MEYER and O. Hoenigschmid confirm the empirical formula $C_{40}H_{64}O$, previously given by other workers to caryophyllin, but their researches show that the molecule

is a multiple of four of this simple expression, $C_{40}H_{64}O_4$. Pure caryophyllin melts at 235° C. in a sealed tube, and sublimes without decomposition *in vacuo*. The acetyl product $C_{40}H_{60}(O.COCH_3)_4$ has the m. pt. 268°—271° C. Caryophyllinic acid, obtained by the action of fuming nitric acid on caryophyllin, is proved to contain four carboxyl groups, and yields a tetramethyl ester $C_{40}H_{60}O_4(OCH_3)_4$, m. pt. 155°—160° C. J. Herzog has obtained a diphenylurethane from caryophyllin $C_{40}H_{60}O_4.CO.N(C_6H_5)_2$, m. pt. 137—138. He was only able to obtain a diacetyl-, and not a tetracetyl-compound on acetylating caryophyllin. Contrary to Meyer and Hoenigschmid's experience, he found that caryophyllin cannot be obtained pure by mere recrystallisation from alcohol. The product so obtained was not wholly soluble in ether, and the portion soluble therein, gave less carbon, when burnt, than agrees with the above formula. He also found that caryophyllin forms crystalline alkali-salts. Caryophyllin forms a benzoyl compound which melts at 173° to 185° C.—J. O. B.

Amyl Alcohol; Preparation of Inactive —. P. Freundler and E. Damond. *Comptes rend.*, 1905, **141**, 830—831.

METHYL-ETHYL ketone is reduced at 140° C., according to the directions of Sabatier and Senderens (this J., 1903, 1012), and the secondary butyl alcohol formed is separated from the untouched ketone by fractional distillation. The alcohol is cooled to 0° C., phosphorus tribromide (1 mol. to 2 mols. of alcohol) slowly dropped in, the mixture left for 10 hours in the cold, and then heated on the water-bath till no more hydrobromic acid is evolved. Water is added, the bromide separated from the aqueous phosphorous acid, washed, dried, and rectified. (Yield over 83 per cent. of theory.) From the bromide, the magnesium derivative is prepared (adding to the ethereal solution a few drops of carbon bisulphide, which moderates the violence of the reaction of the magnesium, and practically prevents the formation of butane or butylene), and this is treated at once with the theoretical quantity of trioxymethylene (this J., 1902, 286), which has been thoroughly dried at 100° C. *in vacuo*, and heated for 24 hours on the water-bath. The yield is about 73 per cent. of the amyl alcohol, and 7 per cent. of the corresponding formal $CH_2(OC_5H_{11})_2$
 $C_2H_5 \cdot CO \cdot CH_3 + H_2 = C_2H_5 \cdot CH(OH) \cdot CH_3$
 $C_2H_5 \cdot CH(MgBr)CH_3 + CH_2O$
 $= C_2H_5 \cdot CH(CH_2O \cdot MgBr)CH_3$
 $C_2H_5 \cdot CH(CH_2O \cdot MgBr)CH_3 + OH_2$
 $= C_2H_5 \cdot CH(CH_2OH)CH_3 + BrMgOH.$

The retarding action of carbon bisulphide and similar substances, favourable in this case, is sometimes prejudicial where the reaction is not originally violent; in preparing triphenylearbinol, for instance, commercial ether contains substances (removable only by treatment with sulphuric acid) which entirely prevent the reaction of the magnesium on the halide.—J. T. D.

Esters; Influence of Water and Alcohols on the Boiling Point of —. I. A Modification of Markownikoff's Method of Preparation. J. Wade. *Chem. Soc. Trans.*, 1905, **87**, 1656—1668.

ACCORDING to Markownikoff (*Ber.*, 1873, **6**, 1177), who devised the so-called "continuous" modification of Scheele's method for the preparation of esters, interaction between alcohol and acetic acid in presence of concentrated sulphuric acid, does not take place below 130° C. On continuing the addition of alcohol and acid, however, as in Markownikoff's process, the action usually slackens gradually, and finally stops, owing to the accumulation of the liberated water. The author has found that under certain conditions the process becomes really continuous. An excess of alcohol must be employed, and the reaction flask must be immersed as completely as possible in the water-bath, so that condensation in its neck shall be minimised. The presence of sulphuric acid is essential, but there is no advantage in using a large quantity; the best results are obtained when 10 or 20 c.c. are employed. The sulphuric acid is mixed in the distilling flask with twice its volume of the mixture of alcohol and acid (in the case of ethyl acetate, for example, 3 vols. of ethyl alcohol to 2 vols. of acetic acid), and

heated on the water-bath until the action commences. The mixed alcohol and acid are then delivered at a suitable rate beneath the surface of the liquid in the distilling flask, preferably through a dropping funnel, the stem of which is drawn out to a moderately fine point. A relatively large heating surface is essential for rapid action. All the simple aliphatic esters and many of the more complex and aromatic esters may be prepared in this manner, the operation being carried on under reduced pressure in the case of the less volatile products.

In the preparation of ethyl acetate, most of the products obtained by the "slow" continuous process, that is, with the distilling flask only partly immersed in the water-bath—boiled, after re-distillation, almost constantly at 70°–71°C. namely, 6° below ethyl acetate, and it seemed probable, therefore, that they contained a mixture of constant boiling point. Direct experiments with pure alcohol, ethyl acetate, and water confirmed this view, and the following mixtures of constant boiling point were isolated.

Composition.			Sp. Gr.	B. pt. °C.
Ethyl acetate.	Alcohol.	Water.		
83.2	9.0	7.8	0.9085	70.3
69.4	30.6	—	0.8682	71.8
91.4	—	8.6	—	70.45
—	95.5	4.5	0.8075	78.15

In the "slow" continuous process, practically the ternary mixture of ester, alcohol and water is obtained, a certain amount of water and acetic acid also passing over. In the "fast" process, however, (with the distilling flask well immersed in the water-bath), the temperature of the distilled vapours approximates to 81°C., and the distillates consist of the ternary mixture and the binary mixture of alcohol and water. The method most frequently quoted for the purification of crude ethyl acetate, consists in washing with a strong solution of calcium chloride or brine, and drying with calcium chloride, but this method is quite useless. Indeed, Le Canu (Comptes rend., 1885, 100, 40) has shown that calcium chloride is freely soluble in ethyl acetate, and decomposes when heated with it. The method used by the author consists in floating the crude product on water, when the alcohol becomes distributed between the two layers, and on distilling the mixture from a water-bath, the ternary mixture of ester, alcohol and water, and the binary mixture of ester and water pass over practically uncontaminated with the excess of alcohol, until the ester is exhausted. On repeating this operation once, a distillate is obtained containing only about 1 per cent. of alcohol. The remaining alcohol and water may be removed by fractionation through a very efficient still-head, when they are eliminated as ternary and ester-water mixtures (the water should be in slight excess, as the ester-alcohol mixture is difficult to separate); or by drying roughly with potassium carbonate and distilling over phosphorus pentoxide. The last traces of impurities can only be removed by careful fractionation, either of the dry ester, or better, the ester with 0.5 per cent. of water.—A. S.

Vanillin; Determination of —. J. Haas. XXIII., page 1326.

1,2-Naphthoquinone-4-sulphonic Acid; Condensations with —. (Ehrlich-Herter's Reaction). F. Sachs and M. Craveri. XXIV., page 1327.

ENGLISH PATENTS.

Dialkylbarbituric Acids; Manufacture of —. G. B. Ellis, London. From E. Merck, Darmstadt, Germany. Eng. Pat. 5353, March 14, 1905.

SEE Fr. Pat. 354,452 of 1905; this J., 1905, 1125.—T. F. B.

Salicylic Acid Compound; Manufacture of a New —. G. B. Ellis, London. From Chem. Fabr. von Heyden Act.-Ges., Radebeul, Saxony. Eng. Pat. 19,375, Sept. 25, 1905.

By the action of a bismuth salt on sodium salicylate, a

mixture of a bismuth disalicylate and salicylic acid is obtained; this is neutralised (or the salicylic acid extracted with an indifferent solvent), and the product washed with cold water. Its composition is represented by the formula:

It is decomposed by boiling with water into salicylic acid and the known bismuth monosalicylate. —T. F. B.

GERMAN PATENTS.

Chlorinating Organic Substances with Sulphuryl Chloride; Process of —. A. Wohl. Ger. Pats. 160,102, Jan. 31, 1902, and 162,394, Jan. 21, 1903.

The substance to be chlorinated is heated with sulphuryl chloride, and the evolved gases are passed into fuming sulphuric acid, from which sulphuryl chloride may be regenerated. The second patent describes a modification for use when the substances are very volatile, the acid gases being, in this case, passed through a body of the substance to be chlorinated, which can subsequently be treated with sulphuryl chloride; this avoids possible decomposition of the product by the fuming sulphuric acid.—T. F. B.

Anhydrides of Monobasic Organic Acids; Process for Preparing —. Verein f. Chem. Industrie. Ger. Pat. 161,882, March 30, 1902.

ANHYDRIDES of monobasic organic acids can be obtained in good yield, and free from the acid chloride, by the action of sulphuryl chloride on a mixture of an alkaline-earth salt of the acid with 10 or 15 per cent. of an alkali salt of the acid. The reaction is stated to proceed as easily as when the alkali salt alone is employed.—T. F. B.

Methylolamides; Process of Preparing —. A. Einhorn. Ger. Pat. 162,395, May 19, 1903. Addition to Ger. Pat. 158,088, Sept. 23, 1902. (See this J., 1905, 615.)

THE substitution of halogenated fatty acid amides for aromatic acid amides in the principal patent enables certain methylolamides to be prepared which could not be obtained previously. The preparation of the methylolamides from mono- and trichloroacetamide, monobromo- and monoiodo-acetamide and α -bromopropionic acid amide are described.—T. F. B.

Aldehydes [and Ketones] with Negatively Substituted Methyl- or Methylene Compounds; Process for Preparing Condensation Products of —. E. Knoevenagel. Ger. Pats. 161,171, Dec. 1, 1903, and 162,281, June 10, 1904.

ALDEHYDES and ketones can be condensed with negatively substituted methyl or methylene compounds by means of salts of ammonium or of primary or secondary amines. Compounds of acid character can be condensed by this means, in fact, the presence of an acid rather assists the reaction. Thus benzaldehyde and cyanoacetic esters give benzalcyanooacetic esters; salicylic aldehyde and malonic acid produce coumarincarboxylic acid; acetone and malonic acid give β -dimethylacrylic acid (by using ammonium malonate), &c.—T. F. B.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

FRENCH PATENT.

Printing: Revolving Brushes for —. [Utilisation of Waste from Photographie Films.] Soc. Anon. des Plaques et Papiers Photographiques, A. Lumière et ses Fils. Fr. Pat. 350,187, Sept. 24, 1904, V., page 1276.

XXII.—EXPLOSIVES, MATCHES, Etc.

(Continued from page 1856.)

Explosives; Aluminium in —. C. E. Bichel. Z. angew. Chem., 1905, 18. 1889—1892.

A NUMBER of patents have been taken out for the addition to ammonium nitrate explosives of aluminium, the contention being that the force of explosion is thus greatly increased. This contention is based on the results of trials in the lead block, which does undoubtedly show a much greater enlargement of the cavity with the explosive containing aluminium than with the corresponding explosive without it. Yet actual use in the mine has demonstrated that the increase in efficiency due to the addition of aluminium is so slight as to be hardly noticeable. The author considers that the lead block test is unsuitable for comparing explosives except those of the same class, and he measures instead the "shock effect," which is proportional to the square of the detonation-speed and to the amount of gas produced, and the "pressure effect" of the explosion of the substance in its own volume, which is proportional to the amount of gas produced, the temperature of explosion, and the density of the explosive. He compares two explosives (See Führer, this J., 1901, 68), consisting of (1) ammonium nitrate, 95.5; charcoal, 4.5; and (2) Ammonium nitrate, 72.0; aluminium powder, 23.5; charcoal, 4.5. In the lead block, No. 1 gave an enlargement of 250. No. 2 of 329 c.c.; an increase of 31.6 per cent. The detonation-speeds of the two were respectively 3380 and 3450 m. per second; a scarcely noticeable difference, and consequently little difference in the shock effect. The densities of the two were 0.8652 and 0.9003, or the specific volumes 1.156 and 1.113 l. per kilo.; the heats of explosion were 727 and 1600.5 calories, and hence the temperatures of explosion (calculated from these figures and the composition of the products) 1710° and 3914° C. The volumes of gas produced by the explosion of 1 kilo., calculated to N.T.P. were 977 and 594 litres; and the volumes into which these gases were compressed were 1.156 litres and 0.996 litre (1.113—0.115, the volume of the alumina produced) respectively. Consequently the pressure of these gases at 0° C., 863 and 616 kilos. per sq. cm., would be, at the temperature of the explosion in each case, 6338 and 9425 kilos. per sq. cm., or the addition of the aluminium has raised the pressure by nearly 50 per cent. But this increased pressure is due to the much higher temperature of explosion; and while this is effective in melting and softening the lead of the block it does not affect the sides of the borehole, and the temperature there falls so rapidly that there is not much effective difference between the two mixtures. The calculated increase of pressure was shown experimentally when 100 grms. were exploded in a space of 15 litres; instead of 48.84 and 62.85, the observed pressures were 40.6 and 54.42 kilos. per sq. cm. The absolute pressures were low, from incompleteness of the detonation; but the differences are almost alike.

Commercially, it can only pay to add aluminium when it is cheap, as the increase of lifting power actually attained is so small; and it is useless to add it where greater shattering power is aimed at. Moreover, it can only be added economically to those explosives which have low temperatures of explosion; with others, the comparatively small rise of temperature gained, is more than counterbalanced by the lessened volume of gas produced. The readiness with which aluminium (especially when finely powdered) oxidises in air is also prejudicial to its use in explosives.—J. T. D.

Magazine; Circumstances attending the Destruction of a Factory — at the Factory of the Thames Storage (Explosives) Co., Ltd., at St. Mary's Marshes, in the Hundred of Hoo, in the County of Kent, on July 29, 1905. By Captain A. P. H. Desborough, H.M. Inspector of Explosives.

A MAGAZINE containing 9,730 lb. of powder was totally destroyed by fire under circumstances which indicated that spontaneous ignition of the contents had taken place,

and the grass on the surrounding mound was also ignited but easily extinguished. The powder consisted of:—

800 lb. normal rifle powder imported	1896
1280 " " " " "	1896
50 " " flameless, " "	1901
900 " " cannon " "	1902
4000 " " sporting " "	1904
200 " Walsrode K.O. " "	1899
2500 " " K.L. " "	1901.

In the case of all, except the powder imported in 1896, the importation licenses containing the reports of Dr. Dupré, were traced, which showed these powders to have a heat test of 20—30 minutes. With regard to the importation of normal rifle powder in 1896, Dr. Dupré's reports for that year show that in all but one case, that of a small sample showing a heat test of 8½ minutes, the quality was satisfactory. This exception, however, renders it probable that, owing to insufficient purification, the 1896 powder possessed a slight degree of instability, which, after nine years' storage, had augmented so as to produce spontaneous decomposition. A certain amount of suspicion must also be attached to the Walsrode powder owing to the fact that the fire first broke through the roof in that part of the building in which this powder was stored.

Attention is called to the necessity of carrying out periodical tests on powders stored in magazines for a long time, and also to the danger of allowing long grass to grow in the neighbourhood. In addition it is suggested, without reference, however, to the case in question, that magazines should be so constructed, that when the maximum quantity of explosive is stored, there is sufficient space to arrange the contents so that that of old manufacture shall be issued first.

The practice, which is not uncommon, of allowing damaged or defective blasting cartridges to accumulate in magazines, is condemned as a source of danger.—B. J. S.

ENGLISH PATENT.

Safety Explosives; Manufacturing Mine-Gas-Proof —. The Castropoer Sicherheitssprengstoff Akt.-Ges., Dortmund, Germany. Eng. Pat. 18,275, Sept. 9, 1905. Under Int. Conv., Sept. 10, 1904.

THE fundamental explosive mixture is treated with an addition of ammonium salts—preferably chloride—and metallic salts of organic acids (especially salts of the fixed alkalis or alkaline earths), a portion of these latter being sometimes replaced by salts yielding oxygen, such as nitrates, chlorates, perchlorates, chromates, bichromates, permanganates, &c.—C.S.

UNITED STATES PATENT.

Phosphorus; Process of Making Red —. R. Schenck and P. Marquart, Assignors to The Firm of Chem. Fabr. Bettenhausen Marquart and Schulz. U.S. Pat. 804,555, Nov. 14, 1905. VII., page 1303.

FRENCH PATENT.

Matches; Manufacture of Wax —. M. Bals. Fr. Pat. 350,213, Oct. 8, 1904.

PLAITED yarn, preferably three-ply jute, is first drawn through an alcoholic solution of resinous matter, the impregnation serving to mask the smell of the fibre when burning, prevent glowing after extinction, and facilitate the adherence and minimise the absorption of the materials taken up in the subsequent baths. The plait is next passed through powdered magnesium carbonate or other suitable substance, which acts as a filler, economises wax, and improves the colour of the matches. After drying, the plait is coated with the usual mixture of paraffin, stearin, Carnauba wax, &c., in a molten condition, and when sufficiently cooled, is polished between grooved milling rollers, cut into match lengths, and dipped in the ordinary manner.—C. S.

GERMAN PATENT.

Match-Sticks from Fir and Pine Wood; Process for the Manufacture of —. R. C. J. Falek. Ger. Pat. 162,025, March 10, 1903.

The fir or pine wood is treated with an emulsion containing about 20 parts of benzene (petroleum spirit), 20 parts of oil of turpentine and 1000 parts of water. It is stated that after this treatment, the wood can be readily impregnated with paraffin wax, and burns with a calm, odourless flame.—A. S.

XXIII.—ANALYTICAL CHEMISTRY.

APPARATUS, Etc.

Porous Bodies as Permeable Substances for Gases; Different Applications of —. Porous Contact. K. Prytz. Overs. o. d. Kgl. Danske Vidensk. Selsk. Forh., 1905, 293—306. Chem. Centr., 1905, 2, 1569—1570.

The author deals with the use of substances the pores of which allow gas, but not mercury, to pass through, for making gas-tight connections and stoppers. For example, an open tube with an enlargement at its upper end, is provided with a plaster of Paris stopper just below the enlargement, and mercury is introduced above the porous stopper. The lower end of the tube dips into mercury, and the tube is thus rendered gas-tight. If another tube carrying a plaster of Paris stopper at its lower end, and from which the air has been exhausted, be dipped into the mercury in the upper part of the first tube, until the two porous stoppers come in contact, the gas rises from the first into the second tube. Stoppers of fire-clay (a material which allows gases to pass freely, but is quite impermeable to mercury) are stated to be even better than plaster of Paris stoppers. Numerous applications of this method of using porous stoppers are described in the original.—A. S.

UNITED STATES PATENT.

Burette. A. M. Söderlund, Göteborg, Sweden. Assignor to G. G. G. Oxenstierna, Philadelphia, Pa. U.S. Pat. 804,894, Nov. 21, 1905.

The burette, graduated from the zero line downwards, is combined with a reservoir and a pipe connection (fitted with a two-way tap), as well as with an open pipe, fitting air-tight in the reservoir and cut off obliquely at the lower end, so that the upper edge of the orifice is on a level with the zero line on the burette, in order to maintain the fluid level automatically.—C. S.

Sulphates; Determination of — by means of Benzidine Hydrochloride in the Presence of Thiosulphates, Sulphites, and Sulphides. O. Huber. Chem.-Zeit., 1905, 29, 1227—1229.

In testing the volumetric method of Müller and Dürkes (this J., 1903, 1104, also 883, 925) the author has closely followed the original directions with the exception of using potassium hydroxide in place of sodium hydroxide solution. The results obtained with solutions of pure sulphates were in close agreement with the theoretical amounts, and confirmed the accuracy of the method in this respect. It was found, however, that benzidine hydrochloride yielded precipitates also with sodium thiosulphate, sulphite and sulphide, and that the method was, therefore, inapplicable in the presence of these salts. Attempts to destroy them by means of hydrochloric acid proving unsatisfactory, the following method was subsequently adopted:—(1) The solution containing the four salts was treated with bromine in order to oxidise the thiosulphate, sulphite and sulphide to sulphate, the total amount of which was then titrated with benzidine hydrochloride after removal of the bromine and cooling the solution. (2) Another portion of the original solution was run from a burette into a N/10 solution of iodine acidified with hydrochloric acid, and the excess of iodine titrated with N/10 thiosulphate solution.

The amount of iodine consumed by the solution corresponded to the amount of thiosulphate, sulphite and sulphide. (3) A third portion of the original solution was heated to the boiling point, the sulphide thrown down by means of freshly-precipitated cadmium carbonate, and the liquid cooled, made up to 250 c.c., shaken, and filtered. (a) 100 c.c. of the clear filtrate were used for a determination by means of iodine as in (2), the result giving the thiosulphate and sulphite. (b) Another portion (100 c.c.) of the filtrate from (3) was mixed with 10 c.c. of 2N-acetic acid and 30 c.c. of 2N-sodium acetate solution, and the mixture boiled for 20 to 25 minutes, after which the flame was removed, and the solution treated with about 1 gm. of potassium chlorate, allowed to cool, and titrated with N/10 iodine solution, the result giving the amount of thiosulphate. The addition of acetic acid was made with the object of expelling the sulphurous acid from the sulphite, whilst the potassium chlorate was intended to oxidise the last traces of sulphur dioxide. The thiosulphate remained unchanged in these operations in spite of the presence of a large amount of ammonium acetate.

The different results were calculated into the corresponding amounts of sulphates and deducted from the total sulphates found in (1), the difference giving the amount of sulphates in the original solution. The results thus obtained were somewhat higher than the amounts of sulphates taken, which the author attributed, in the main, to the very considerable solubility of benzidine sulphate. In his opinion, the preliminary heating of the solution before the precipitation, is not advisable, for the adsorption phenomena mentioned by Müller and Dürkes have, he asserts, much less bearing upon the results than the solubility of the precipitate.—C. A. M.

Ozone; Quantitative Determination of —. F. P. Treadwell and E. Anneler. Z. anorg. Chem., 1905, 48, 86—97.

The authors review the methods that have been proposed for the determination of ozone (compare this J., 1899, 1150; 1900, 561, 776, 1146; 1901, 749), and, after giving the results of comparative experiments with different processes, recommend for use in works the following modification of Ladenburg and Quasig's method (this J., 1901, 749). A glass bulb of known capacity (300—400 c.c.) is filled with distilled water, and the latter is displaced by the gas to be examined. From 10 to 20 c.c. of a 5 per cent. solution of potassium iodide are then forced into the bulb, and after 20—30 minutes the liberated iodine is titrated with N/10 thiosulphate solution. If the volume of gas contained in the bulb be v c.c. when referred to 0° C. and 760 mm., and the number of c.c. of thiosulphate solution used be n , then the percentage by weight of the ozone in the gaseous mixture is represented by the formula:

$$\frac{168 \times n}{v + 0.56 \times n}$$

whilst the percentage by volume is given by the expression:

$$\frac{112 \times n}{v}$$

—A. S.

Lead and Copper; Electrolytic Assay of —. G. A. Guess. Bull. Amer. Inst. Mining Eng., 1905, Nov., 1239—1243.

For greater speed and economy of labour in making daily assays of ores, &c., containing small quantities of lead or copper, the author has devised the following modifications of electrolytic methods, and has equipped a laboratory plant of some 60 cells:—

The electrodes are corrugated sheets of thin, roughened, platinum foil provided with tags, which are clamped in terminal holders on the wall. These electrodes, one cathode sheet of 50 sq. cm. surface between two smaller anode sheets, are suspended in beakers containing the solution of the material to be assayed.

In the case of lead, a nitric acid solution of the ore is employed and is found to give reliable results, the metal being deposited as peroxide on the anode and 45 determinations being made daily.

In the case of copper a nitric acid solution is also employed; but it has been found possible to work with a

much higher current density (5 ampères for cathodes as above) than that usually employed, thus considerably shortening the duration of the analysis. This is effected by adding to the electrolyte a reagent which is stated to be a nitro-compound made from hard mineral oil. Di-nitro- α -naphthalene also gives similar results, but apparently requires more care. —R. S. H.

Ammonium Salts; Decomposition of — by Hot Sulphuric Acid in presence of Platinum. M. Delépine. VII., page 1302.

ORGANIC—QUALITATIVE.

Formaldehyde and [Organic] Nitrogen Compounds Containing Oxygen; A very Sensitive Reaction of —, which is also a Colour Reaction of Albuminoid Substances. E. Voisenet. Bull. Soc. Chim., 1905, 33, 1198—1214.

WHEN an albuminoid substance is treated with formaldehyde and dilute sulphuric or (preferably) hydrochloric acid, containing a small quantity of nitrous acid, a violet coloration is produced, especially if the mixture be warmed to about 50° C. The reaction is stated to be sensitive to 1 part of formaldehyde per million: the intensity of the colour produced, increases, with increase of formaldehyde, to a maximum, and then decreases until no longer apparent when the solution contains 20 per cent. of formaldehyde. An excess of nitrous acid also prevents the reaction. It is found preferable to use hydrochloric acid containing 0.005 and 0.01 gram. of nitrous acid per litre, the latter being used when the formaldehyde exceeds 1 part per 100,000. The coloration is caused by the oxidation of the condensation products of formaldehyde with the decomposition products of albuminoids, and can be reproduced by substituting indole or skatole for albumin. Gelatin, keratin, and pure peptone do not give this reaction, but most of the other proteid compounds do so: since "purely pepsic" peptones do not give the reaction whilst tryptic peptones show it clearly, this reaction is suggested for differentiating these compounds. Aldehydes in general cannot be substituted for formaldehyde: acrolein and benzaldehyde give an indigo blue coloration, but phenolic aldehydes produce the same result as formaldehyde. Other oxidising agents than nitrous acid also give the reaction, e.g., nitric acid, hydrogen peroxide, ferric salts. It is stated that 1 part of nitric acid in two million parts will produce a coloration. The following applications are suggested:—(1) Detection and determination of formaldehyde in milk: 15 c.c. of hydrochloric acid containing nitrous acid (see above) of both strengths is added to 5 c.c. of milk, and the mixture is warmed to 50° C., and allowed to stand for two hours or more if no colour appears. The determination of formaldehyde is carried out colorimetrically against samples containing known quantities of formaldehyde. (2) Detection of nitrous products in hydrochloric or sulphuric acid. (3) Detection of nitrates in water. (4) Detection of dilution of milk by determining amount of nitrates present, contained in the water. (5) Determination of albumin in urine or liquids containing only traces of it.

(Ehrlich-Herter's Reaction.) 1.2-Naphthoquinone-4-Sulphonic Acid; Condensations with —. F. Sachs and M. Craveri. XXIV., page 1327.

ORGANIC—QUANTITATIVE.

FRENCH PATENT.

Gaseous Mixtures; Method of Examining —. Soc. C. Zeiss. Fr. Pat. 356,388, July 25, 1905. Under Int. Conv., Aug. 8, 1904.

The quantitative composition of gaseous mixtures is determined by measuring or registering photographically the refraction of light rays at the point where they pass from the said mixture into the medium used for comparison, or *vice versa*, or during their alternate and suc-

cessive passage from the one medium into the other. The rays are assumed to fall at an oblique angle on the plane of separation between the two media.—C. S.

Sodium Palmitate; Hydrolysis of —. R. Cohn. Ber., 1905, 38, 3781—3784.

SCHWARZ (Z. öffentl. Chem., 1905, 6, 301) asserted that it was impossible to obtain sharp determinations of fatty acids by titrating the excess of alkali with aqueous acid unless sufficient alcohol had been added to prevent the hydrolysis of the soap. Against this, the author points out that correct saponification values are obtained in the case of beeswax without such addition, and he also shows that they are possible in the titration of free fatty acids. When pure palmitic acid is dissolved in an excess of hot N/2 sodium hydroxide solution and the excess of alkali titrated back with N/2 aqueous hydrochloric acid, with phenolphthalein as indicator, neutrality is reached when the deep red colour of the liquid changes to faint pink. In test experiments, the amounts of palmitic acid thus determined, ranged from 99.5 to 100.4 per cent. of the quantities taken, and it is stated that with practice, the error need not exceed 0.5 per cent. of the theoretical amount. If now, after neutralisation, the addition of acid to the hot liquid be continued, the pink colour remains for a long time unchanged owing to the hydrolysis of the soap, and the solution then suddenly becomes colourless when the palmitic acid separates out. It was this point that Schwarz regarded as the end of the reaction, with the result that in some of his experiments, he found only 56 per cent. of the theoretical amount of palmitic acid. It is impossible with phenolphthalein as indicator to continue the titration to a quantitative end of the hydrolysis of the soap, but this can be done when methyl orange is used as indicator, the sodium palmitate then showing a quantitative hydrolysis into palmitic acid and sodium chloride. Hence, the behaviour of sodium palmitate on titration is completely analogous to that of sodium carbonate, when methyl orange is used as indicator. So long as free palmitic acid ions derived from the hydrolytic dissociation of the soap remain in solution, the reaction continues alkaline, in spite of the addition of acid; and it is not until the whole of the palmitic acid has separated out in an insoluble form that the free hydrogen ions can come into solution, the colour of the methyl orange being then immediately changed to red.

—C. A. M.

Vanillin; Determination of —. J. Hanus. Z. Unters. Nahr. Genussm., 1905, 10, 555—591.

THE method proposed is based on the precipitation of vanillin by means of *m*-nitrobenzhydrazide. For the determination of vanillin in vanilla, 3 grms. of the latter are extracted for three hours with ether. The ethereal solution is evaporated at a temperature of 60° C.; the residue is dissolved in a small quantity of ether, filtered into an Erlenmeyer flask, washed with ether, and the solution again evaporated. The residue is now dissolved in 50 c.c. of water, the mixture being carefully heated and shaken to aid solution, and the emulsion so obtained, precipitated by the addition of 0.2 gram. of *m*-nitrobenzhydrazide dissolved in 10 c.c. of hot water. The flask is placed on the water-bath for 30 minutes and then allowed to stand for 24 hours at the ordinary temperature. After removing fat by shaking out the mixture with petroleum ether, the latter together with the aqueous portion is poured through a weighed filter and the precipitate washed first with water, then with petroleum spirit, and the filter and its contents dried and weighed. The weight of precipitate multiplied by the factor 0.4829 gives the quantity of vanillin.—W. P. S.

XXIV.—SCIENTIFIC & TECHNICAL NOTES.

(Continued from page 1260.)

Light; Chemical Action of —. X. G. Ciamician and P. Silber. Ber., 1905, 38, 3813—3824. (See this J., 1901, 844, 943; 1902, 876, 1477; 1903, 50, 764; 1904, 138, 341; 1905, 461, 641.)

It has been shown previously that nitrobenzene in alcoholic

solution is reduced to aniline by the action of light, quinakline being also formed owing to a further condensation process. Further experiments have now been made on the action of light on solutions of nitrobenzene in ethyl, propyl and isomyl alcohols. In methyl alcoholic solution, there was practically no change. The solutions were exposed to the light for several months. The chief products were basic substances, the yield in the form of hydrochlorides being—in methyl alcohol, 0.2 grm.; ethyl alcohol, 6.8 grms.; propyl alcohol, 8.5 grms.; and isomyl alcohol, 6.6 grms.; in each case from 100 grms. of nitrobenzene.

The chief constituent of the basic products was in each case aniline, but other bases were also present, viz., quinakline, $\alpha\beta$ -ethylmethylquinoline and $\alpha\beta$ -iso-butylisopropylquinoline from the ethyl, propyl and isomyl alcohol solutions respectively. Also, in all three cases, very small quantities of a basic substance, $C_6H_7O_3N$; and in the experiments with propyl alcohol, a basic substance, $C_{12}H_{15}ON$, were obtained. The portion of the reaction products soluble in alkali contained in all three cases *p*-aminophenol. Experiments were also made with respect to the action of light on nitrobenzene in presence of aromatic aldehydes. Satisfactory results were only obtained with anisaldehyde, the products obtained corresponding exactly to those obtained when benzaldehyde was used. The chief reaction products were anisic acid, dianisoylphenyl hydroxylamine, anisoylanilide, azoxybenzene and *o*-hydroxyazobenzene.

It will be seen that the decomposition of nitrobenzene, in presence of aromatic aldehydes, on exposure to the light, proceeds in the stages represented as follows:—

the different compounds, however, can only be isolated in the form of transformation products or derivatives, for example, nitrosobenzene in the form of azoxybenzene and *o*-hydroxyazobenzene, and phenylhydroxylamine and aniline in the form of benzoyl and other acyl derivatives. In the presence of aliphatic alcohols, the action of light on nitrobenzene is more energetic, as although phenylhydroxylamine (in the form of its transformation product, *p*-aminophenol) and aniline are obtained, no nitrosobenzene nor compounds derived from the same, can be isolated from the products of the reaction in this case.

—A. S.

1.2-Naphthoquinone-4-Sulphonic Acid; Condensations with — (Ehrlich-Herter's Reaction). F. Sachs and M. Craveri. Ber., 1905, 38, 3685–3696.

It is known (Böniger, Ber., 1894, 27, 95) that 1.2-naphthoquinone-4-sulphonic acid reacts with aniline to form a deeply coloured substance $C_{16}H_{12}O_2.NHC_6H_5$ [O : O : NHC_6H_5 = 1 : 2 : 4]. The sulphonic group is eliminated and replaced by the aniline residue. This reaction is very delicate. A fiery cinnabar-red precipitate is at once obtained in the cold by adding a solution of aniline in water (containing only 1 part in 300,000 parts) to a neutral solution of 1.2-naphthoquinone-4-sulphonate of sodium. All primary amines of the benzene or naphthalene series, aminoazo bodies, phenylenediamines, aminophenols, aminosulphonic and aminocarboxylic acids react in a similar way in neutral or acetic acid solution, and yield sparingly soluble precipitates. P. Ehrlich and C. A. Herter, Z. physiol. Chem., 1904, 41, 379) and C. A. Herter (J. experim. med., 1905, 7, No. 1) recently described new and characteristic colour reactions of 1.2-naphthoquinone-4-sulphonic acid with a large number of other substances, including many of physiological importance, which are obtained as readily as the condensation products with primary amines. The following of the colorations described by Ehrlich and Herter are cited:—nitromethane, deep-violet; trinitrotoluene and acetylacetone, reddish brown; acetoacetic ether, orange-red; cyano-acetamide, deep reddish violet; phenylpyrazolone, greenish-blue; methyl-phenylpyrazolone, blue-green; rhodamine acid, deep blue-violet; resorcinol, violet; phloroglucinol, brownish-violet; pyrrol, purplish-violet; piperidine, scarlet; piperazine, red.

The present work deals with the constitution of the

coloured products obtained by the action of 1.2-naphthoquinone-4-sulphonic acid on the following substances containing a "negative" methylene group, viz.:—benzylcyanide, *p*-nitrobenzylcyanide, malonitrile, cyanoacetic ether (violet coloration), and ethyl malonate (cherry-red coloration).

The authors find that the reaction which takes place is strictly analogous to the aniline condensation. The sulphonic group is expelled and replaced by the organic radical. They consider that 1.2-naphthoquinone-4-sulphonic acid is very useful for characterising bodies containing "negative" methylene groups, owing to the ease with which they can be converted into well defined, sparingly soluble condensation products with this substance.—H. L.

New Books.

COAL TABLES, 1904. [295.] Wyman and Sons, Ltd., London. Price 6d.

THIS is the eleventh number of a publication annually prepared in the Commercial, Labour and Statistical Department of the Board of Trade, showing the production and consumption of coal in the principal countries of the world during each of the years from 1883 to 1904, or to the most recent years for which the figures are available. In addition to statistics of production and consumption, particulars are also given of the average value per ton at the collieries, the number of persons employed in coal mining, coal imports and exports, &c.; statistics of lignite production and petroleum production in certain countries are also contained in the return. Tables relating to the consumption of coal, have been amplified by the inclusion of statistics with regard to the principal British Colonies.

An article on the coal production and consumption of the principal countries of the world, based on this return, appears on next page.

Trade Report.

I.—GENERAL.

CHIMNEYS; COMPARISON OF FACTORY AND DOMESTIC—.

Chem. Trade J., 1905, 37, 526.

Of the 250 million tons of coal mined per annum, 19 per cent. is used for general steam-raising purposes and 15 per cent. for domestic purposes. From tests of the products of combustion: (1) passing through a factory chimney (in connection with a steam-raising plant), and (2) from an ordinary open grate, the following comparison is made.

Products of Combustion per Ton of Coal Burned.

	Factory.	Domestic.
	lb.	lb.
Soot	5.8	8.0
Hydrocarbons	nil	8.0
Sulphuric acid (H_2SO_4)	48.0	65.0

Accepting this basis of comparison, the absolute weight of impurities produced in one year is as follows:—

	Factory.*	Domestic.†
	Tons.	Tons.
Soot and volatile hydrocarbons	121,000	132,000
Sulphuric acid (H_2SO_4)	1,000,000	1,070,000

* 47 million tons of coal burned.

† 37 million tons of coal burned.

—A. S.

II.—FUEL, GAS, AND LIGHT.

COAL PRODUCTION AND CONSUMPTION IN THE PRINCIPAL COUNTRIES OF THE WORLD.

Bd. of Trade J., Nov. 30, 1905.

The production of coal in the five principal coal-producing countries of the world in 1902, 1903 and 1904, was as follows:—

Countries.	1902.	1903.	1904.
	Tons.	Tons.	Tons
United Kingdom	227,095,000*	230,334,000*	232,428,000*
Germany	107,474,000†	116,638,000†	120,816,000†
France	29,365,000†	34,216,000†	33,838,000†
Belgium	23,877,000†	23,797,000†	23,507,000†
United States of America	269,277,000*	319,068,000*	314,563,000*

* Tons of 2,240 lbs. † Metric tons of 2,204 lb.

‡ Provisional figures.

The production of coal in 1904 in the United Kingdom and Germany was greater than in any previous year, but in France, Belgium, and the United States it did not reach the high figures of 1903. The production of the United States exceeds that of the United Kingdom, but the production of Germany represents only about a half, and that of France and Belgium together about a quarter of the production of this country.

The total known coal production of the world (exclusive of brown coal or lignite), is now about 790 million tons (of 2,240 lb.) per annum, of which the United Kingdom produces rather less, and the United States rather more than a third.

The following statement shows the production of coal in the principal British Colonies and Possessions in the year 1903, with comparative figures for the preceding year. The amounts are in every case stated in tons of 2,240 lb.:—

Country.	1902.	1903.
	Tons.	Tons.
British India	7,424,000	7,438,000
Australian Commonwealth	6,860,000	7,112,000
New Zealand	1,363,000	1,420,000
Canada	6,422,000	6,825,000
Transvaal	1,420,000	2,012,000
Cape of Good Hope	166,000	185,000
Natal	593,000	714,000

All the 1903 figures are greater than those for 1902. Nearly the whole of the output of the Australian Commonwealth is produced in New South Wales.

The consumption of coal in some of the chief consuming countries is shown in the following statement, in which the countries are given in the order of importance as coal consumers:—

	1902.	1903.	1904.
	Tons.	Tons.	Tons.
United States	265,694,000	314,114,000	307,610,000*
United Kingdom	166,698,000	168,532,000	166,606,000
Germany	95,363,000	103,114,000	107,160,000*
France	41,989,000	46,442,000	45,559,000*
Russia	19,732,000	21,223,000	22,953,000*
Belgium	20,799,000	21,317,000	21,106,000*
Austria-Hungary	17,595,000	18,123,000	Not available

* Provisional Figures.

The statistics of lignite production show that the principal producing countries are Germany, Austria, and Hungary, which in 1903 produced 45,819,000 metric tons, 22,158,000 metric tons, and 5,272,000 metric tons respectively, whilst the provisional figures available for the German output in 1904 indicate an increased production of 48,633,000 tons. In Austria the output of lignite for 1904 was 21,988,000 tons, a decrease, compared with 1903, of nearly 200,000 tons. The quantity of lignite produced in the

United States is included in the figures for the production of coal already given. The latest available figures showing the production of lignite separately relate to 1903, when it amounted to 5,977,000 tons. In 1892 the production of lignite was only 1,422,000 tons. In no other country does the quantity produced reach one million tons. In the United Kingdom it has for some years been nil.

III.—TAR PRODUCTS, PETROLEUM, Etc.

[PETROLEUM] OIL FIELD; THE ALBERTA —.

Petroleum Review, 1905, 13, 443.

The Alberta oil field is situated in the extreme south-western corner of the province of Alberta, Canada. The first well was sunk in Sept., 1901, and a flow of petroleum amounting to over 300 barrels per day was struck at a depth of 1020 ft. A larger (12 in.) hole has since been sunk, and a large oil-basin has been tapped at a depth of 1100 ft. The oil, which is stated to burn equally well in the crude as in the refined condition, contains 76 per cent. of illuminating oil and 23 per cent. of gasoline; it is quite free from sulphur. There are stated to be good supplies of water, timber, building sand, stone, granite and lime in the neighbourhood of the oil deposit.—A. S.

VII.—ACIDS, ALKALIS, Etc.

GRAPHITE TRADE OF HAMBURG.

Cham. of Com. J., Dec., 1905.

The Hamburg graphite trade increased in 1904, as regards the imports by sea, to 58,162 quintals, valued at 2,549,000 marks, compared with 41,800 quintals, valued at 1,927,000 marks, in the previous year. This increase was chiefly due to exceptional shipments of Ceylon graphite, which rose from 29,674 quintals in 1903 to 47,821 quintals in 1904. The arrivals by rail and river showed a fall from 47,051 quintals, valued at 941,920 marks, in 1903 to 32,358 quintals, valued at 744,329 marks, in 1904. The average value of the graphite imported by sea was 44 marks per quintal, and of that imported from inland 23 marks per quintal. The price of most of the Ceylon graphite imported was slightly under the average of the imports by sea, and the average price also fell by 2 marks for the over-sea imports and 3 marks for the Ceylon graphite below the prices in 1903. The exports of graphite from Hamburg by sea fell from 57,935 quintals, valued at 1,164,000 marks, in 1903 to 50,038 quintals, valued at 1,149,000 marks, in 1904, and especially exports to Great Britain fell from 27,369 quintals to 17,030 quintals. The average price of the graphite sent inland fell to 44 marks (from 46 marks in 1903) whilst the average price of the exports by sea rose to 23 marks (from 20 marks in 1903).

IX.—BUILDING MATERIALS, Etc.

LITHOGRAPHIC STONE TRADE OF BAVARIA.

Bd. of Trade J., Nov. 30, 1905.

The lithographic stone quarries of the parishes of Solenhofen, Moersheim and Langenaltheim supply the best stones. The yearly produce of the quarries is about 12,000 tons, valued at about 2,000,000 marks, of which about 6,000 tons (value 1,000,000 marks) were exported in 1903, and 7,000 tons (1,250,000 marks) in 1904, the remainder being required for the home trade.

As regards the export trade, the United States of America were the largest buyers, purchasing, of the best qualities, 1,250 tons (540,000 marks) in 1903, and 1,500 tons (650,000 marks) in 1904. France comes next, for value if not for quantity, having imported 600 tons (100,000 marks) in 1903, and 650 tons (120,000 marks) in 1904. Great Britain follows with 500 tons (50,000 marks) in 1903 and 800 tons (80,000 marks) in 1904.

The export to Great Britain, after gradually declining from 1900 to 1903, showed a slight increase in 1904, but it was considerably less than during the years 1897 to 1899, when, roughly estimated, it averaged yearly about 1,500 tons, valued at 150,000 marks.

Lithographic stones are also exported from the above

district to Austria-Hungary, Italy, Russia, Switzerland, Spain, Portugal, Belgium, Holland, Norway, Sweden, Finland, the Balkan States, South America, Australia, India and Japan. The demand from the two last-mentioned countries is said to be increasing considerably.

NOTE.—All values mentioned are to be taken as values at Solenhofen.

X.—METALLURGY.

SILVER PRODUCTION OF THE WORLD.

Eng. and Mining J., Nov. 25, 1905.

In the first of the accompanying tables is given a comparative statement of the silver production of the world in the years 1903 and 1904. The returns of Germany are defective in that they do not discriminate between silver won from foreign ores and that obtained from ores mined in the country. As Germany is a large importer of base bullion, there is no doubt that the greater part of its silver product is from foreign ores, and should not properly be credited to the country.

Silver Production of the World.

	1903. Troy Oz. Fine.	1904. Troy Oz. Fine.
America, North—		
United States	54,300,000	57,786,100
Canada	3,198,581	3,718,668
Mexico	67,832,760	60,808,879
Central America	2,100,900	655,357
America, South—		
Argentina	50,000	66,153
Bolivia	6,614,957	6,083,333
Chile	1,650,000	868,667
Colombia	2,000,000	946,066
Ecuador	40,000	—
Peru	5,491,349	4,667,047
Uruguay	1,000	1,093
Europe—		
Austria	1,279,972	1,254,888
Hungary	619,877	643,000
France	751,890	609,638
Germany	5,830,000	12,532,938
Greece	1,090,367	895,172
Italy	784,084	757,777
Norway	240,898	257,200
Russia	260,776	172,912
Spain	4,090,000	4,576,076
Sweden	32,298	20,923
Turkey	486,297	564,685
United Kingdom	174,896	174,517
Asia—		
Dutch East Indies	124,678	175,479
Japan	1,770,152	3,208,620
Australia	11,909,040	14,558,892
Africa	450,000	486,408
Other countries	48,226	50,000
Total	173,222,088	176,840,014

In the second table is given the world's production of silver from 1875 to the present date. From 1895 to the present time the production has not varied greatly, fluctuating from year to year but in no startling fashion. At the present time, outside of Mexico and Bolivia, silver is very largely a by-product, and the quantity obtained, therefore, does not vary directly with the demand for the metal itself, but rather with the demand for the metals of construction with which it is associated.

Year.	Troy Oz. Fine.	Year.	Troy Oz. Fine.
1875	63,317,014	1900	180,093,364
1880	79,731,936	1901	174,851,391
1885	96,250,831	1902	164,560,358
1890	134,404,104	1903	173,222,088
1895	182,220,228	1904	176,840,014

The total production shows an increase of 3,617,926 oz., or 2.1 per cent., over that of 1903. This gain was made in spite of a decrease of over 7,000,000 oz. in the Mexican output, and was due to the advance made in production in the United States, Australia, Spain, and nominally in

Germany. The decrease in 1904 from the year of maximum production, which, during the period covered by records was 1895, is not great, amounting only to 5,380,214 oz.

XII.—FATS, FATTY OILS, Etc.

COCO-NUT PALM PRODUCTS FROM CEYLON. EXPORTS OF—

Bull. Imp. Inst., 1905, 3, 217.

The following table gives the value of the exports of coco-nut products from Ceylon during the last few years.

	1901.	1902.	1903.
	Rs.	Rs.	Rs.
Arrack	72,082	106,332	129,064
Coco-nuts	773,391	711,918	649,635
Coco-nuts, desiccated	2,314,708	2,870,549	3,104,609

Quills, coco-nut leaf ..	150	—	—
Total	Rs. 17,970,835	20,861,491	25,945,893
	£ 1,198,055	1,390,766	1,729,726

—J. F. B.

XIII.—BREWING, WINES, SPIRITS, Etc.

ALCOHOL FROM SAWDUST.

Chem. and Drug., 1905, 67, 871—872.

The Board of Inland Revenue has removed the restrictions which have hitherto been placed on the manufacture of industrial alcohol from sawdust (see this J., 1901, 734, 1908). In this process, glucose is formed as an intermediate product, but if the duty (2s. 9d. per cwt.) were paid on this, the manufacture would become unprofitable. The Excise authorities have now accepted the process as a continuous one, whereby the difficulty with respect to glucose being a dutiable article has been overcome.—A. S.

WINE PRODUCTION OF NON-BRITISH COUNTRIES.

Cham. of Com. J., Dec., 1905.

The estimated production of wine by other than British countries in 1905 is given by the "Revue Vinicole," as follows:—

Hectolitres.	Hectolitres.
France, including	2,100,000
Algiers and Tunis	72,000,000
Austria	38,200,000
Italy	28,750,000
Spain	8,500,000
Russia	8,400,000
Roumania	2,700,000
Chile	2,300,000
United States	2,200,000
Germany	2,100,000
Bulgaria	2,100,000
Portugal	2,100,000
Austria	1,900,000
Turkey and Cyprus	1,900,000
Argentina	1,600,000
Peru	1,500,000
Switzerland	1,200,000
Greece	1,100,000
Total	*176,450,000

* The hectolitre = 22 galls., making the total production 3,881,900,000 galls.

XX.—FINE CHEMICALS, Etc.

ESSENTIAL OILS.

Schimmel's Report, Nov., 1905.

Almond Oil [Fixed].—Reports from Syria indicate that this year's harvest of Damascene apricot kernels is a poor one. Not more than 2,000 bales are expected to be available, compared with 5,500 bales in 1904, and 8000 bales in a good year. High prices are anticipated, at least 90 francs per 100 kilos, being attained, but at present no business has been transacted at that figure. A demand has arisen for inferior Mersina kernels up to 70 francs, and for Aleppo kernels up to 75 francs. Better grade Tripoli kernels are said to have changed hands at 77 to 80 francs.

During the past year the demand for pure apricot

kernel oil has been slack. On the other hand the demand for the essential oil has been brisk.

Anise Oil, Russian.—The anise harvest is expected to yield about 80,000 poods this year, compared with 120,000 poods in 1904. Old stocks of seeds are small, and high prices will probably prevail.

Star-Anise Oil.—An improvement in the price of star-anise oil is probable. The import into Hamburg during 1904 amounted to 52,040 kilos.; in 1903 it was 30,000 kilos. The shipments during 1905 show a decided falling off.

Bergamot Oil.—The fall in the price of this oil, predicted last spring, has taken place. Holders of stock, induced by the promise of a heavy crop, have placed their reserve on the market. Heavy purchases have been made by foreign buyers who have not been slow to take advantage of the low rate. The exhaustion of the reserve stock has, therefore, caused a slight rise which will probably be maintained until the new season's oil is available. Present stock in hand does not probably exceed 2,500 to 3,000 kilos, which will certainly be exhausted before the new oil arrives on the market. Although a good harvest was generally predicted this has not been realised over the whole bergamot producing area. The crop south of Reggio is still considered to be fairly good; but to the north, and in the more elevated plantations, the trees have suffered much from the inclement weather of the past summer. The harvest, as a whole, will probably be a medium one. Prices for new oil will probably rule somewhat lower than last year, at the commencement of the season.

Cajeput Oil.—The price of this oil has now fallen to a normal figure. The total shipments from Macassar for the first five months of the present year amounted to about 35,500 kilos. The United States continue to take the largest portion of this export, and the demand for the oil there is increasing; in Germany the consumption appears to be on the decline.

Caraway Oil.—The Dutch caraway harvest, estimated at 30,000 bales, is only one-third of the crop of last year. Owing to the great drought of last year a large portion of the land usually devoted to caraway culture has been cropped with beet, so that probably the area under caraway will be considerably below the normal next year also. The yield of oil by the seeds of this year's harvest is also poor. The export from Holland to Germany during 1904 amounted to 35,456 bales. A further marked advance in the price of caraway seeds and oil is, therefore, imminent.

Cassia Oil.—During the last 20 years the price of cassia oil has varied from 5.80 marks per kilo. in 1887, to 17 marks in 1896. During the past three years it has remained comparatively steady at 7.20, 7.40, and 7 marks per kilo. These figures relate only to high grade oils assaying 80–85 per cent. of cinnamic aldehyde. The oil now arrives upon the market in a state of greater purity than formerly; many parcels pass the lead acetate test for colophony of the Ph. C. IV. It is, however, still necessary to check the reputed quality of the oil by the determination of the percentage of cinnamic aldehyde.

Cinnamon Bark Oil.—A fall of 10 per cent. in the price of cinnamon chips has taken place since the beginning of the year. Germany now occupies the position of chief consumer, with an import of 882,980 lb.; America took 591,924 lb.; Spain, 489,500 lb.; and the United Kingdom 320,893 lb., out of a total export of 2,615,397 lb. A further fall in the already abnormally low price is not improbable.

Citronella Oil.—There has been only a very slight reduction in the price of citronella oil during the past six months, and that only for future autumn shipments. From Jan. 1 to July 31, 1905, the total shipments from Ceylon amounted to 682,443 lb. The United Kingdom took 249,490 lb.; America, 320,908 lb.; and Germany, 54,555 lb. From experiments conducted in the Royal Botanical Gardens of Ceylon, the following interesting data on the yield of grass and of oil distilled therefrom have been obtained. One acre planted with "maha paugiri" grass in July, 1902, gave 10,809 lb. of cut grass, yielding 48 lb. of oil in March, 1904, and another 8,511 lb., yielding 36 lb. of oil

in Aug., 1904; or a total of about 84 lb. The yield is therefore 1 lb. of oil from 230 lb. of grass. Other experiments tend to show that, considering the low value of land, and the cheapness of labour in Ceylon, the citronella industry is not so unremunerative as is sometimes stated.

Clove Oil.—The clove crop in 1904 was exceptionally good, attaining 14,447,600 lb., against 5,552,700 lb. in 1903, and 7,462,309 lb. in 1902. The high prices ruling rendered the crop most remunerative to the growers. The harvest having proved to be greater than anticipated, a fall in price took place to 22 florins; but, owing to speculation in the drug, the price soon rose to 37 florins per 50 kilos. The position of the clove market cannot be predicted with any certainty, since it is not influenced by the normal factors of supply and demand, but by the fictitious prices caused by the operations of speculative buyers.

Sicilian and Calabrian Oils.—The shipments of the aurantiaceous essential oils have somewhat fallen off during the first eight months of the present year, showing a total of 523,458 kilos, against 612,737 kilos. for the corresponding period last year. This is attributed to the large stocks held abroad, chiefly in America. That country has taken about 63,200 kilos, less, the United Kingdom 20,800 kilos, and France 2,500 kilos, less; whereas, the export to Austria for Germany shows an increase of 12,300 kilos.

Eucalyptus Oils.—Australia is again the chief source of eucalyptus oils rich in cineol; no other country can compete permanently against such an enormous output. Portugal furnishes a few thousand kilos. of oil, but Algeria has been completely supplanted in the market, and only sends out a very small quantity. The present money value of the best rectified oils of the *globulus* class, with a guaranteed cineol content of 60 per cent. is very low.

No other country can compete with Australia in the production of eucalyptus oils containing phellandrene, but at present the use of these is limited.

Geranium Oil.—Algerian geranium oil has reached an unprecedented low price. This has been brought about by the competition of Reunion oil, which is now produced in very large quantities and is shipped to Europe without regard to the state of the market. At present, the price of the oil cannot cover the cost of production. The amount exported from Reunion during the first eight months of 1905, amounted to no less than 280,000 kilos., which alone is probably in excess of all demands.

Lemon Oil.—The operations of the syndicate of growers and manufacturers have caused an artificial fluctuation in prices on the lemon oil market. Having succeeded in raising the price from 4.40 marks per kilo. to 5.25 marks, a further advance to 5.75 marks was forced. When the most pressing engagements for oil had been met at this figure, buyers entirely withdrew, causing a decline almost to the original low price. In July, a second attempt was made by the syndicate to force the price to 5.25 and 5.75 marks; but again the effort failed, and values dropped to 5 or 5.25 marks per kilo.; while the syndicate withdrew from the market a stock of oil estimated at 60,000 kilos. A further stock of 40,000 kilos. is reported to be held by the growers, so that the efforts of the syndicate have not been very successful, and have given rise to dissensions among its members. No detailed information is at present available on the coming lemon harvest. In Sicily, a medium crop is anticipated; but since the Spanish lemon crop has fallen short, a large export of fruit in cases is expected; the price for fruit on the trees, therefore, rules high. Probably part of the oil in stock will be carried over to the next season. Prices are expected to lie between 4.50 and 5 marks per kilo. for the new oil.

Lemongrass Oil.—Prices for lemongrass oil have ruled steady; the total shipments from Ceylon from July 1, 1904, to June 30, 1905, amounted to 1882½ cases against 2222½ in the preceding year, so that any material change in price is not probable. The high price realised for the oil has stimulated interest in its cultivation, and fresh land is being cropped with it. In some districts, the cultivation of lemongrass has been neglected in favour of citronella,

but at present prices the former would be very remunerative, since it is now four times as high as it was five years ago. This is due to the consumption of the oil in the new ethral and ionone industry.

Neroli Oil.—This year's orange flower harvest has been a very poor one owing to severe damage by frost and rain. Blooms were therefore very dear, and a corresponding high price obtains for the oil. The price of blossoms has also been influenced by a syndicate, and out of a crop of flowers estimated at 900,000 kilos., about 700,000 kilos. are said to have been in its possession. In normal years, the amount of blooms amounts to more than double this quantity.

Bitter Orange Oil.—Prices have remained firm during the summer, although the demand has been small. The present stock in Sicily is believed to be about 1,000 kilos. The prospects of the coming crop are unfavourable; it is estimated at about three-fifths of last year's production. Prices are, therefore likely to be maintained. Although fluctuations in price occurred last year, the quality of the oil was good.

Sweet Orange Oil.—A brisk demand in May, and unfavourable reports on the blooming of the trees caused a gradual advance in price up to 15.50 marks, but in July and August a fall to 14.50 and 14.25 marks per kilo. took place, due to a slackening in the demand. Stocks of oil in hand are short, and are estimated at 2,500 to 3,000 kilos. The prospects of the new harvest are bad; the trees in Calabria having suffered from the severe frosts in the winter, not more than half the quantity of fruit of the previous year is expected. In Sicily, appearances were at first more promising, but became less favourable during the summer, owing to the great loss by dropping of the immature fruit. The failure of the orange crop in Spain, owing to winter frosts, will also probably create a demand for the fruit for export in cases from Sicily, so that much of the harvest may be sold at good prices on the trees.

Orris Root and Oil.—The abnormally low prices for Florentine orris root and its preparations are likely to prevail, since the output is more than equal to the demand, and large stocks appear to be held abroad. The area under orris cultivation in the Verona district is diminishing, in consequence of the low prices obtained. A few years back 600 tons per annum was produced, but this year the crop will not exceed 80 tons. But this has not affected the price, the roots only fetching one-fourth the amount obtainable ten years ago. Yet Verona orris is used by preference in the United States, and if a fair demand were to arise the price would doubtless improve.

Peppermint Oil, American.—A larger area in Wayne county has been cropped with peppermint, as a result of the good prices obtained in 1904, but no definite opinion as to the yield of oil can yet be given. Certain districts are said to have been adversely affected by weather and insects. Old stocks of oil in producers' hands are said not to exceed 3000 lb. In the low-lying districts of Michigan the weather has been unpropitious for the peppermint crop. On the higher ground the prospects of the crop are excellent. The probable yield is estimated at about 25 lb. per acre. In Indiana about twice as much land is cropped with peppermint as last year, and it is believed that a yield of 35 lb. per acre will be attained. The area devoted to peppermint growing in Wayne County is estimated at about 933 acres; in Michigan, at 7375 acres; in Indiana, at 1000 acres. The total American output will probably approach 232,700 lb. Consequently, high prices are not likely to obtain.

Peppermint Oil Industry.—The total area under cultivation with peppermint plants in Japan in 1905 was 10,221 acres, as against 11,189 acres in 1904; the 1905 crop of oil is estimated at 476,226 lb. The first crop in Biugu Bitchin has been short, but this is no criterion for the whole harvest, the chief factors in which are the second crop in September, and the third in November. As, however, large stocks of the oil are

now held in London, Hamburg, and in Japan itself, these will have the effect of checking a rise in price. The decline in American peppermint oil will also have the same effect. Probably, therefore, if any rise in price takes place, it will only be temporary. The total shipments of menthol and peppermint oil from Japan during the first six months of 1905 have amounted to 3803 cases, or about 228,180 lb., which is more than any previously recorded export. More than half of the total export of Japanese peppermint oil during 1904 was shipped to Hamburg.

Peppermint Oil; Mitcham.—The oil obtained in this year's distillation is of exceptionally fine quality, but the area under cultivation is smaller than previously, consequently the supply of oil is limited. The English peppermint industry is seriously affected by the practice of applying the name "Mitcham" peppermint to mixtures of all kinds of inferior oils.

Pine-Needles; Essential Oil of.—The large demand which has arisen for pine-needle oil, from *Pinus montana*, for medicinal purposes, and the small supply available from Switzerland, has placed the market in a critical position. Possibly this may lead to the distillation being undertaken in other districts, such as on the Carpathians, where, at one time, it was proposed to establish distilling works. The Siberian product is said to be available in sufficient quantity.

Rose Oil (Otto of Rose).—The yield of otto of rose in Bulgaria this year is estimated at about 4150 kilos., compared with 5000 kilos. in 1904 and 6200 kilos. in 1903. The tendency of prices is upward, as it is believed that stocks will soon be exhausted.

Sandal-wood, East Indian.—The value of sandal-wood oil has remained fairly steady; the demand for the wood continues to increase steadily, not only among Western nations, but also in China, to which country the quantity exported has nearly quadrupled since 1900. The total export of wood from India during the season 1904—1905 amounted to 31,744 cwt. in 1903—1904 it was 30,448 cwt. The effect of the "spike" disease is now stated to be less serious than was at one time feared. Considerable quantities of Australian sandal-wood continue to be shipped to Chinese and East Indian ports; in 1903 the value of this amounted to 37,913*l.*, and in 1902, 61,771*l.*

—J. O. B.

QUININE: ITALIAN STATE.—

Chem. and Drug., Dec. 9, 1905.

The "Bollettino-Chemico Farmaceutico" says that the figures relative to the great increase in the sale of State quinine during the last working year have just been published. From July 1, 1903, to June 30, 1904, the sales amounted to 6,174 kilos., value 672,927.40 lire, with a profit of 183,038 lire; while for the year 1904—5 now quoted, the sales weighed 14,061 kilos. quinine, value 1,150,597.85 lire, with a profit of 183,382.47 lire, which has been allocated to the fund for combating the malaria. The sales of the current year up to now have again increased by one-third.

Patent List.

(Continued from page 1270.)

N.B.—In these lists, [A.] means "Application for Patent," and [C.S.] "Complete Specification Accepted."

Where a Complete Specification accompanies an Application, an asterisk is affixed. The dates given are (i) in the case of Applications for Patents, the dates of application, and (ii) in the case of Complete Specifications Accepted, those of the Official Journals in which acceptances of the Complete Specifications are advertised.

Complete Specifications thus advertised as accepted are open to inspection at the Patent Office immediately, and to opposition within two months of the said dates.

I.—PLANT, APPARATUS, AND MACHINERY.

[A.] 24,566. Brunner. Furnaces. Nov. 28.

„ 24,602. Herrick. Apparatus for promoting combustion.* Nov. 28.

- [A.] 24,734. Davidson. Drying chambers. Nov. 29.
 „ 24,737. Faller. Boiling apparatus for liquids containing or depositing solid substances.* Nov. 29.
 „ 24,739. Pollak. Process for making extracts for baking, pharmaceutical and technical purposes. Nov. 29.
 „ 24,872. Malmendier and Stähler. Mixing apparatus for saturating liquids with gases. Nov. 30.
 „ 25,404. Schröder. Method of manufacturing homogeneous products from liquids or liquefied substances and apparatus therefor.* Dec. 6.
 „ 25,461. Lane. Hydro-extractors. Dec. 7.
 „ 25,552. Grove. Apparatus for evaporating liquids.* Dec. 8.
 „ 25,576. Trotman and Hackford. Apparatus for automatically regulating the temperature of ovens, dyeing vats or the like, and for controlling the supply of fuel to a steam generator, or the like. Dec. 8.
 „ 25,609. Chavanne and Ollagnier. Method of grinding and apparatus therefor. [Fr. Appl., May 29, 1905.]* Dec. 8.
 „ 25,610. Chavanne and Ollagnier. Grinding mills. [Fr. Appl., Sept. 27, 1905.]* Dec. 8.
 [C.S.] 28,197 (1904). Claridge. Apparatus for heating, cooling, and similar purposes. Dec. 13.
 „ 29,358 (1904). Hencke. Apparatus for separating solid substances from liquids. Dec. 6.
 „ 13,763 (1905). Lane. Furnaces. Dec. 6.
 „ 16,087 (1905). Hausmann. *See under X.*
 „ 20,653 (1905). Oxley. Apparatus for use in ascertaining the extent to which materials lose or gain in weight in being subjected to drying, or exposure to moisture, or other treatment tending to cause gain or loss in weight. Dec. 13.

II.—FUEL, GAS, AND LIGHT.

- [A.] 24,443. Hutchins and Wilkie. Gas producer apparatus. Nov. 27.
 „ 24,634. Still and Adamson. Incandescent gas mantles and the manufacture thereof. Nov. 28.
 „ 24,680. Van Vriesland. Treatment of the woven tubes and of the yarns used in the manufacture of incandescent mantles. Nov. 29.
 „ 24,786. Wilkinson. Producing and utilising mixtures of coal gas and air for lighting, heating and power purposes. Nov. 30.
 „ 24,828. Carpenter. Burner for testing gas.* Nov. 30.
 „ 24,949. Lake (Deutsche Gasglühlicht A.-G.). Incandescing bodies or mantles for incandescent gas lighting. Dec. 1.
 „ 25,045. Heckert. Introduction of steam or gas into a gas retort. Dec. 2.
 „ 25,046. McRae and Ingram. Manufacture of acetylene gas. Dec. 2.
 „ 25,275. Wilton. Manufacture of gas from carbonaceous materials.* Dec. 5.
 „ 25,313. Atkinson. Suction gas producers. Dec. 6.
 „ 25,437. Weatherhogg. Hydrocarbon fuel burners. Dec. 7.
 „ 25,466. Schatz. *See under XXIII.*
 „ 24,574. Simpson. Process of and apparatus for the desulphurisation of coke. Dec. 8.
 „ 25,596. Lake (Sclac Ges.m.b.H.). Manufacture of a mixture of gas and air for illuminating purposes. Dec. 8.
 „ 25,663. Lake (Sclac Ges.m.b.H.). Manufacture of a mixture of gas and air for illuminating purposes. Dec. 9.

- [A.] 25,665. Elsenhans. Processes and apparatus for purifying gases. [Ger. Appl., Dec. 13, 1904.]* Dec. 9.
 [C.S.] 29,360 (1904). Schwarz. Purification of furnace gases. Dec. 6.
 „ 1947 (1905). Strenge, Strenge, Strenge and Strenge. Manufacture of peat briquettes and the like. Dec. 13.
 „ 3420 (1905). Hesketh and Willeox. Treating air for supply to blast furnaces, converters and the like. Dec. 6.

III.—DESTRUCTIVE DISTILLATION, TAR PRODUCTS, PETROLEUM, AND MINERAL WAXES.

- [A.] 24,503. Otto Hilgenstock Coke Oven Co. (Otto und Co.). Carbonising coal for increasing the yield of ammonia. Nov. 27.
 [C.S.] 7630 (1905). Henderson. Apparatus for treating paraffin wax. Dec. 6.
 „ 19,540 (1905). Van der Heyden. Solidification of hydrocarbons such as petroleum and benzine. Dec. 6.

IV.—COLOURING MATTERS AND DYESTUFFS.

- [A.] 25,498. Abel (Act.-Ges. f. Anilinfabr.). Manufacture of dyestuffs of the triphenylmethane series. Dec. 7.
 [C.S.] 3819 (1905). Johnson (Badische Anilin und Soda Fabrik). Manufacture of new compounds of the a thracene series and of colouring matters therefrom. Dec. 6.
 „ 8744 (1905). Meyenberg, Weizmann, and Clayton Aniline Co., Ltd. Manufacture of anthracene derivatives and dyestuffs therefrom. Dec. 13.
 „ 9074 (1905). Abel (Act.-Ges. f. Anilinfabr.). Manufacture of nitro-derivatives of certain aromatic bases. Dec. 13.
 „ 10,101 (1905). Abel (Act.-Ges. f. Anilinfabr.). Manufacture of new sulphurised dyestuffs. Dec. 6.
 „ 11,196 (1905). Newton (Bayer und Co.). Manufacture of anthraquinone derivatives. Dec. 6.
 „ 12,757 (1905). Newton (Bayer und Co.). Manufacture of a new anthracene derivative. Dec. 6.
 „ 19,132 (1905). Johnson (Badische Anilin und Soda Fabrik). Manufacture of anthracene derivatives and of colouring matters therefrom. Dec. 6.
 „ 19,199 (1905). Badische Anilin und Soda Fabrik. Manufacture of anthracene derivatives. Dec. 6.
 „ 23,122 (1905). Johnson (Badische Anilin und Soda Fabrik). Manufacture of solid stable salts of indigo white. Dec. 6.

V.—PREPARING, BLEACHING, DYEING, PRINTING AND FINISHING TEXTILES, YARNS, AND FIBRES.

- [A.] 24,565. Bunzl and Brandt. Manufacture of silk-like threads. Nov. 28.
 „ 24,762. Livesey. Apparatus for opening, guiding and spreading woven fabrics in bleaching, scouring, dyeing, printing, and like processes. Nov. 30.
 „ 24,895. Marsden. Hawking machines for dyeing textile fabrics. Dec. 1.
 „ 24,977. Fletcher. Finishing textile goods and apparatus therefor. Dec. 1.
 „ 25,030. Proude. *See under XII.*
 „ 25,054. Lake (Comp. Manuf. Fluminense). Machines for printing fabrics and wall papers.* Dec. 2.

- [A.] 25,088. Calico Printers' Assoc., Ltd., Kay and Warr. Fixation of certain finishes or effects on woven piece goods. Dec. 4.
- " 25,537. The British Algin Co., Ltd., Ingham and Bunzl. Treatment of textiles, paper, leather and other absorbent materials with compounds of alginic acid. Dec. 8.
- " 25,538. Owens and Lowe. Apparatus for treating fibrous materials with dye or other liquors. Dec. 8.
- " 25,545. Lawson. Method of producing fancy printed fabrics. Dec. 8.
- " 25,576. Trotman and Hackford. *See under 1.*
- " 25,586. Thorner. Manufacture of sizing, thickening, stiffening or finishing, or waterproofing material for textiles and other fabrics. Dec. 8.
- " 25,602. Ellis (Chem. Fabr. von Heyden, A.-G.). Manufacture of aldehyde hydrosulphite salts.* Dec. 8.
- " 25,681. Baudot. Treatment of raw wool. [Fr. Appl., Dec. 13, 1904.]* Dec. 9.
- [C.S.] 26,287 (1904). Bernhardt. Washing and rinsing machine for fibrous materials. Dec. 13.
- " 6230 (1905). Duckworth. Manufacture of coloured polished yarns. Dec. 13.
- " 16,726 (1905). Maurel. Waterproofing of soft felt hats. Dec. 13.

VII.—ACIDS, ALKALIS, AND SALTS.

- [A.] 24,458. Majert and Majert. Method of making artificial carbonic acid baths. [Ger. Appl., Nov. 26, 1904.]* Nov. 27.
- " 24,503. Otto-Hilgenstock Coke Oven Co. (Otto und Co.). *See under III.*
- " 24,507. Teichner. *See under XI.*
- " 24,733. Roberts. Manufacture of hydrochloric acid.* Nov. 29.
- " 24,849. Harris. Apparatus for the generation of ozone. Nov. 30.
- " 25,477. Muth. Production of aluminium oxide from bauxite. Dec. 7.
- [C.S.] 2174 (1905). De Stuckl. Apparatus for the manufacture of alkali or alkali hydrates and zinc sulphides. Dec. 13.

VIII.—GLASS, POTTERY, AND ENAMELS.

- [A.] 24,913. Gottlieb. Process for the decoration of enamel, porcelain, majolica, glass, and the like. Dec. 1.
- " 25,639. Thornton, Sharp, Ingle and Stanley. Kilns for burning or fixing the colours or glaze on glass or earthenware. Dec. 9.

IX.—BUILDING MATERIALS, CLAYS, MORTARS, AND CEMENTS.

- [A.] 24,924. Noble, Greaves and Wilson. Method of manufacturing artificial marble. Dec. 1.
- " 25,051. Paulsen. Impregnation of wood. Dec. 2.
- " 25,389. Schliekum. Process for the production of polished artificial stone.* Dec. 6.
- [C.S.] 26,465 (1904). Illemann. Manufacture of insulating coverings for steam pipes, boilers, and the like. Dec. 12.

X.—METALLURGY.

- [A.] 24,486. Hybinette. Process of refining copper nickel matte.* Nov. 27.
- " 24,647. Sterne. Desiccation of air for metallurgical operations. Nov. 28.
- " 24,655. Kalinowsky. Process for disintegrating basic slag. [Ger. Appl., Nov. 29, 1904.]* Nov. 28.
- " 25,004. Brayshaw. Process of hardening steel. Dec. 2.

- [A.] 25,420. Rodda, Rodda and Rodda. Machinery for extracting the metals from tin and other pulverised ores.* Dec. 4.
- " 25,422. Hybinette. Process of separating metals.* Dec. 4.
- " 25,245. Fyfe. Ore-roasting furnaces. Dec. 5.
- " 25,371. Boul (Brown). Treatment of sulphide and other ores.* Dec. 6.
- " 25,672. Turton. Extraction of metals from their ores.* Dec. 9.
- [C.S.] 29,282 (1904). Elmore. Apparatus for separating certain constituents of subdivided ores, &c. Dec. 6.
- " 3420 (1905). Hesketh and Willcox. *See under II.*
- " 12,652 (1905). Campbell. Treatment of chromiferous iron. Dec. 6.
- " 15,649 (1905). Cothias. Process of casting articles in aluminium or its alloys. Dec. 6.
- " 16,087 (1905). Hausmann. Crucible furnaces. Dec. 13.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

- [A.] 6790A. Potthoff. Apparatus for electro-plating.* Dec. 1.
- " 24,507. Teichner. Process for electrolytically producing peroxide of hydrogen.* Nov. 27.
- " 24,538. Howorth (Kellner). Electrodes for electrolytic apparatus. Nov. 27.
- " 25,174. Soc. Anon. Electrometallurgique (Proc. P. Girod). Electric furnaces. [Fr. Appl., Jan. 4, 1905.]* Dec. 4.
- " 25,670. N.S. Electric Storage Co., and Niblett. Secondary or storage batteries. Dec. 9.
- [C.S.] 6872 (1905). Wood-Smith. Ozonisers and like apparatus for treating gases electrically. Dec. 6.
- " 11,301 (1905). Cie. Thermo-Electrique (Système Hermite). Couples for sulphide of copper thermo-electric generators. Dec. 6.
- " 22,460 (1905). Yasuda. Electrodes. Dec. 6.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

- [A.] 24,935. Oelwerke Stern-Sonneborn A.-G. Manufacture of ricinus oil product. [Ger. Appl., Dec. 9, 1904.]* Dec. 1.
- " 24,936. Oelwerke Stern-Sonneborn A.-G. Manufacture of ricinus oil product. [Ger. Appl., Dec. 9, 1904.]* Dec. 1.
- " 25,030. Proude. Soap for use in finishing woollen goods.* Dec. 2.
- " 25,068. Lehfeldt. Purifying butter, oils, fats, lard and the like. Dec. 2.
- " 25,204. Kessler. Soaps, ointments, and the like. Dec. 5.
- " 25,425. Burley and Burley. Manufacture of soap. Dec. 6.
- " 25,680. Verein. Chemische Werke A.-G. Manufacture of fatty acids from fatty acid esters. [Ger. Appl., Jan. 25, 1905.]* Dec. 9.
- [C.S.] 29,558 (1904). Mayor, Aldermen and Citizens of Bradford, Garfield and Grossmann. *See under XVIIIB.*
- " 12,525 (1905). De Hemptinne. Process for eliminating the odour of fish oil. Dec. 13.

XIII.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(A.)—PIGMENTS, PAINTS.

- [A.] 9017A. Chatillon. Preparation of products of antimony for painting and other purposes.* Dec. 9.
- [C.S.] 13,647 (1905). Tomlins and Bowley. Self-cleansing compositions for prevention of fouling of ship's bottoms. Dec. 13.
- " 16,490A (1905). Brunet. Manufacture of a white antimony pigment. Dec. 6.

(B.)—RESINS, VARNISHES.

- [A.] 25,042. Nairn. Manufacture of inlaid materials. Dec. 2.

(C.)—INDIA-RUBBER.

- [A.] 25,291. Bloxam (Bamber). Manufacture of india-rubber. Dec. 5.

XIV.—TANNING, LEATHER, GLUE, SIZE, Etc.

- [A.] 24,487. Oakes. Process of treating hides. [U.S. Appl., Dec. 12, 1904.]* Nov. 27.
 „ 24,488. Oakes. Process of treating hides. [U.S. Appl., Dec. 12, 1904.]* Nov. 27.
 „ 24,984. Sandikoff. Purification of glue.* Dec. 1.
 „ 25,187. The British Algin Co., Ltd., and Ingham. Manufacture of a product from seaweed. Dec. 5.
 „ 25,467. Inrig. Treatment of waste leather. Dec. 7.
 „ 25,537. The British Algin Co., Ltd., Ingham and Bunzl. *See under V.*

XVI.—SUGAR, STARCH, GUM, Etc.

- [C.S.] 28,547A (1904). Lichtenstein. *See under XVII.*
 „ 425 (1905). Uhlend. Washing starch out of disintegrated materials. Dec. 6.

XVII.—BREWING, WINES, SPIRITS, Etc.

- [A.] 25,005. Bratby and Hinchliffe, Ltd., and Lang. Apparatus for the aeration of liquids. Dec. 2.
 „ 25,495. Loew. Processes for pasteurising beer and apparatus therefor.* Dec. 7.
 [C.S.] 17,419 (1904). Stanz- und Emailirwerke vorm. C. Thiel und Söhne. Pasteurising beer in bottles. Dec. 6.
 „ 28,547A (1904). Lichtenstein. Preparation of caramel and its application as a colouring matter in the production of fermented liquors, &c. Dec. 13.
 „ 2317 (1905). Chambers and Archibald. Cooling and aerating beer and like beverages. Dec. 13.
 „ 5360 (1905). West and Webster. Process for conditioning, cooling and freeing from fermentable matter, beer and other like liquids. Dec. 13.

XVIII.—FOODS; SANITATION, WATER PURIFICATION; & DISINFECTANTS.

(A.)—FOODS.

- [A.] 24,739. Pollak. *See under I.*
 „ 25,010. Zimmermann and Buchenau. Process for bleaching and sterilising corn and its products. Dec. 2.
 „ 25,068. Lehfelddt. *See under XII.*
 „ 25,653. Héritte. Preservation of organic substances. Dec. 9.
 [C.S.] 27,597 (1904). Livingstone. Manufacture of food for animals. Dec. 6.
 „ 27,854 (1904). Thompson (Gsell). Process for making cream poor in fat and adapted to be whipped. Dec. 6.
 „ 2020 (1905). Simpson and Jackson. Milk products and process and apparatus for producing the same. Dec. 13.

(B.)—SANITATION; WATER PURIFICATION.

- [A.] 25,016. Stephenson. Apparatus for purifying water or other liquids. Dec. 2.
 „ 25,290. Normandy. Stills for producing fresh water from sea water. Dec. 5.
 [C.S.] 29,558 (1904). Mayor, Aldermen and Citizens of Bradford, Garfield and Grossmann. Method and apparatus for recovering fatty and oily matters from sewage sludge. Dec. 13.

(C.)—DISINFECTANTS.

- [A.] 24,618. England. Antiseptic or disinfecting compounds. Nov. 28.
 „ 24,738. Smith and Davis. Disinfectants and deodorisers. Nov. 30.
 [C.S.] 28,813 (1904). King. Disinfecting and deodorising apparatus. Dec. 6.

XIX.—PAPER, PASTEBOARD, Etc.

- [A.] 24,563. Pearson. Process for rendering paper impervious to oil and grease. Nov. 28.
 „ 25,981. Cocking, and Kynoch, Ltd. *See under XXII.*
 „ 25,480. Post. Copying paper. Dec. 7.
 „ 25,537. The British Algin Co., Ltd., Ingham and Bunzl. *See under V.*
 [C.S.] 1727 (1905). Bertram and Milne. Apparatus for the treatment of fibrous materials to be used in the manufacture of paper. Dec. 6.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

- [A.] 21,529A. Abelli. Manufacture of certain amidic derivatives of carbonic acids. Nov. 28.
 „ 24,729. Pollak. *See under I.*
 „ 25,571. Newton (Bayer und Co.). Manufacture of new pharmaceutical compounds. Dec. 8.
 „ 25,680. Verein. Chem. Werke, A.-G. *See under XII.*
 [C.S.] 9008 (1905). Zimmermann (Chem. Fabr. auf Actien, vorm. E. Schering). Manufacture of camphor. Dec. 13.
 „ 18,992 (1905). Fritzsche, Fritzsche and Fritzsche. Process for manufacturing protocatechuic aldehyde. Dec. 13.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

- [A.] 24,586. Wagner. Process of printing photographs in colours. Nov. 28.
 „ 24,875. Krebs. Process for the simplified correction of the chemical effect of the spectrum in reference to photographic purposes.* Nov. 30.
 [C.S.] 27,023 (1904). Zander. Photo-mechanical colour reproduction. Dec. 13.
 „ 8616 (1905). Lange. Process of copying webs of photographic paper and apparatus therefor. Dec. 6.
 „ 8616A (1905). Lange. Process for developing, fixing and drying webs of photographic paper. Dec. 6.
 „ 9116 (1905). Abel (Act.-Ges. f. Anilinfabr.). Developing and finishing photographic plates, films or the like, and photographic developers for use therein. Dec. 13.
 „ 11,239 (1905). Schaack. Production of collotype plates. Dec. 13.
 „ 20,372 (1905). Neue Photographische Ges., A.-G. Reproduction of pictures and the like with aid of catalysis. Dec. 13.

XXII.—EXPLOSIVES, MATCHES, Etc.

- [A.] 24,884. Upton. Explosive mixture. Dec. 1.
 „ 25,081. Cocking, and Kynoch, Ltd. Solvents for nitrocellulose. Dec. 4.
 „ 25,239. Boyd. Explosive compositions. Dec. 5.
 [C.S.] 20,350 (1905). Bokmayer and Swoboda. Match compositions. Dec. 13.

XXIII.—GENERAL ANALYTICAL CHEMISTRY.

- [A.] 25,466. Schatz. Apparatus for use in analysing gas. [Ger. Appl., Dec. 7, 1904.]* Dec. 7.
 [C.S.] 11,067 (1905). Martin. Estimation of the quantity of oil contained in feed water. Dec. 6.

LIST OF COUNCIL AND OFFICERS.

President.

Wm. H. Nichols, M.S., LL.D., D.Sc., 25, Broad Street,
New York City, U.S.A.

Vice-Presidents.

Prof. P. Phillips Bedson, Armstrong College, Newcastle-on-Tyne.

Dr. V. Coblentz, College of Pharmacy, 115, West 68th Street, New York City, U.S.A.

Dr. Edw. Divers, F.R.S., 3, Canning Place, Palace Gate, London, W.

Prof. W. R. E. Hodgkinson, Royal Ordnance College, Woolwich, S.E.

E. Grant Hooper, 16, Royal Avenue, Sloane Square, London, S.W.

David Howard, Devon House, Buckhurst Hill, Essex.

Ivan Levinstein, Hawkesmoor, Fallowfield, Manchester.

Max Muspratt, 2, Mannering Road, Sefton Park, Liverpool.

T. J. Parker, 25, Broad Street, New York City, U.S.A.

Dr. F. B. Power, 6, King Street, Snow Hill, London, E.C.

Sir Wm. Ramsay, K.C.B., D.Sc., LL.D., F.R.S., 19, Chester Terrace, London, N.W.

Thomas Tyrer, Stirling Chemical Works, Stratford, E.

Ordinary Members of Council.

Dr. J. Grossmann, Northern Assurance Buildings, Albert Square, Manchester.

Oscar Guttmann, 12, Mark Lane, London, E.C.

Henry Hemingway, Marsh Gate Lane, Stratford, E.

Prof. W. R. Lang, The University, Toronto, Canada.

Dr. J. Lewkowsch, 71, Priory Road, London, N.W.

N. H. Martin, Northumberland Road, Newcastle-on-Tyne.

B. E. R. Newlands, 2, St. Dunstan's Hill, London, E.C.

Prof. W. J. Pope, F.R.S., 16, Hope Street, Higher Broughton, Manchester.

Dr. Boverton Redwood, 4, Bishopsgate Street Within, London, E.C.

Walter F. Reid, Fieldside, Addlestone, Surrey.

Frank Scudder, Mersey and Irwell Joint Committee, 44, Mosley Street, Manchester.

Dr. W. S. Squire, Clarendon House, St. John's Wood Park, London, N.W.

Chairmen and Secretaries of Sections (Ex-officio Members of Council).

Canadian :

Chairman .. Dr. F. J. Smale, c/o Wm. Davies Co., Toronto, Canada.

Secretary .. Alf. Burton, 114, Bedford Road, Toronto, Canada.

Liverpool :

Chairman .. Eustace Carey, The United Alkali Co., Ltd., 30, James Street, Liverpool.

Secretary .. W. Roseoe Hardwick, 13, Batavia Buildings, Hackins Hey, Liverpool.

London :

Chairman .. A. Gordon Salamon, 1, Fenchurch Avenue, London, E.C.

Secretary .. Julian L. Baker, 7, Addison Road, Bedford Park, London, W.

Manchester :

Chairman .. J. Carter Bell, Bank House, Higher Broughton, Manchester.

Secretary .. Julius Hübner, Ash Villa, Cheadle Hulme, Cheshire.

Newcastle :

Chairman .. Dr. J. T. Dunn, 10, Dean Street, Newcastle-on-Tyne.

Secretary .. E. C. Garrett, Armstrong College, Newcastle-on-Tyne.

New York :

Chairman .. Dr. Russell W. Moore, 47, Linden Place, Orange, N.J., U.S.A.

Secretary .. Dr. H. Schweitzer, 40, Stone Street, New York City, U.S.A.

Nottingham :

Chairman .. J. T. Wood, 62, Park Road, Nottingham.

Secretary .. S. R. Trotman, King's Walk Chambers, Parliament Street, Nottingham.

Scotland :

Chairman .. R. T. Thomson, 156, Bath Street, Glasgow.

Secretary .. Dr. Thos. Gray, c/o Gourlay and Deas, 180, Hope Street, Glasgow.

Sydney, N.S.W. :

Chairman .. Prof. A. Liversidge, F.R.S., The University, Sydney.

Secretary .. T. U. Walton, Colonial Sugar Refining Co., O'Connell Street, Sydney.

Yorkshire :

Chairman .. Prof. H. R. Procter, Rowangarth, Ben Rhydding, *via* Leeds.

Secretary .. Thos. Fairley, 17, East Parade, Leeds.

Honorary Treasurer.

Samuel Hall, East London Soap Works, Bow, E.

Honorary Foreign Secretary.

Dr. Ludwig Mond, F.R.S., 20, Avenue Road, Regent's Park, London, N.W.

General Secretary.

Chas. G. Cresswell, Palace Chambers, Westminster, S.W.
(Telegraphic address :—59, Palatable, London.)

Editor.

Watson Smith, 34, Upper Park Road, Haverstock Hill, London, N.W.

LIST OF MEMBERS.

TOTAL MEMBERSHIP ON FEBRUARY 28TH, 1905 = 4137.

A

1897. Ablett, A. W., P.O. Box 91, Germiston, near Johannesburg, Transvaal, S. Africa, Cyanide Works Manager.
1903. Abraham, Herbert, 13, West 89th Street, New York City, U.S.A., Chemist.
1902. Acker, Chas. E., Acker Process Co., Niagara Falls, N.Y., U.S.A., Manufacturer.
1903. Ackermann, Franz W., 86, Pierrepont Street, Brooklyn, N.Y., U.S.A., Chemist.
1900. Ackroyd, Wm., Borough Laboratory, and (communications) Crossley Street, Halifax, Yorks, Analytical Chemist.
1903. Acton, J. Rowland, Wicklewood, Maze Road, Kew, S.W., Civil Servant.
1892. Adams, Arthur, Kelvin House, Edgbaston Road, Smethwick, near Birmingham, Science Lecturer.
1884. Adams, M. A., "The Kilm," Beasted, near Maidstone, Kent, Public Analyst.
1902. Adams, O. Gore, School of Mines, Thames, Auckland, New Zealand, Director.
1897. Adams, Thos. H., 107, Crewe Street, Derby, Analyst.
1895. Adamson, G. P., 233, Reeder Street, Easton, Pa., U.S.A., Manufacturing Chemist.
1891. Adeock, S. R., St. Helens Smelting Co., Atlas Court, St. Helens, Lancashire, Analytical Chemist.
1901. Addison, Leonard, c/o Messrs. Burt, Boulton, and Haywood, Selzaete, Belgium, Chemist.
1901. Addison, Dr. Wm. L. T., Wm. Davies Co., Ltd., Front Street East, and (Journals) 513, Markham Street, Toronto, Canada, Chemist.
1898. Adgate, M., Naugatuck, Conn., U.S.A., Chemist.
1898. Adiassewich, Alex. V., 6, Camden Gardens, Shepherd's Bush, London, W., Oil Engineer.
1896. Adler, Dr. Leon N., Adler Colour and Chemical Works, 100, William Street, New York City, U.S.A., Manufacturing Chemist.
1888. Adriance, Dr. John S., 105, East 39th Street, New York City, U.S.A., Analytical Chemist.
1899. Adret, Léon, 15, Rue de Neuilly, Rosny-sous-bois (Seine), France, Chemist.
- O.M. Affleck, Dr. J., Highfield, Woodend Park, Grassendale, near Liverpool, Alkali Inspector.
1903. Aicher, Chas. P., Camp Bird Mills, Ouray, Colo., U.S.A., Mill Manager.
1886. Aitken, J. B., Gerard's Fold Chemical Works, Widnes, Chemical Manufacturer.
1884. Akitt, Thos., Mynbouw Maatschappij Katahoen, Lebong Soelit, Benkoelen, Sumatra, Chemist.
1883. Albright, G. S., Bromestarrow Place, Ledbury, Chemical Manufacturer.
- O.M. Albright, W. A., Mariemont, Edgbaston, Birmingham, Chemical Manufacturer.
1891. Aleock, Jno. W., Central Brewery, Mott Street, Birmingham, Malster and Brewer.
1902. Alden, Frederick, 342, 22nd Avenue, Milwaukee, Wis., U.S.A., Chemist.
1898. Alden, John, Chemical Laboratory, Pacific Mills, Lawrence, Mass., U.S.A., Chemist.
1900. Aldrich, Roger C., c/o F. H. Kalbfleisch Co., White and Boerum Streets, Brooklyn, N.Y., U.S.A., Mechanical Engineer.
1890. Aldrick, Edwin John, 53, Alpha Road, West Ferry Road, Millwall, E., Chemical Works Clerk.
1899. Alexander, D. Basil W., 1020, Date Street, Los Angeles, Cal., U.S.A., Chemist.
1900. Alexander, Jerome, c/o National Gum and Mica Co., 502-510, West 45th Street, New York City, U.S.A., Chemist.
1883. Alexander, W. T., Crummock, Eccles, Manchester, Drysalter.
1891. Allan, T. H., Tielke, Portobello House, Wakefield, Analytical Chemist.
1898. Allan, John, Chemist.
1902. Allbright, Wm. B., 513A, Lexington Avenue, Chicago, Ill., U.S.A., Chemical Engineer.
- O.M. Alldred, C. H., S. St. Margaret's Road, Plumstead Common, Kent, Analytical Chemist.
1898. Alleman, Dr. Gellert, Swarthmore College, Swarthmore, Pa., U.S.A., Professor of Chemistry.
1903. Allen, Chas. A., 188, Harwood Street, Darwin, Lancs., Chemist.
1902. Allen, Chas. D., jun., 475, 4th Street, Brooklyn, N.Y., U.S.A., Chemist.
1891. Allen, E. W., Lea Mount, Glossop, Paperstainers' Manager.
- O.M. Allen, J., 164, Upper North Street, Poplar, E., Manufacturing Chemist.
1901. Allen, R. F., 1241, South 47th Street, Philadelphia, Pa., U.S.A., Chemist.
1889. Allen, R. L., Crewe Road, Sandbach, Cheshire, Analytical Chemist.
1904. Allen, Thos. E., c/o American Aristotype Co., Jamestown, N.Y., U.S.A., Chemist.
1900. Allen, Wilfrid T., c/o Hugh Wallace and Co., Ltd., 5, Fenchurch Street, London, E.C., Director.
1904. Allen, Wm. R., c/o Watson, Jack & Co., Montreal, Canada, Dyestuff and Chemical Manufacturer.
1893. Allerton, Rt. Hon. Lord, F.R.S. (Journals), Allerton Hall, near Leeds; and c/o W. L. Jackson and Sons, Ltd., Buslingthorpe, Leeds, Tanner.
- O.M. Allhusen, A., Gateshead-on-Tyne, Chemical Manufacturer.
1886. Allison, G. H., 35, Eglantine Avenue, Belfast, Ireland, Chemical Works Manager.
1887. Alliot, J. B., Messrs. Manlove, Alliot, and Co., Ltd., Nottingham, Mechanical Engineer.
1895. Allis, Wm. O., 100, William Street, New York City, U.S.A., Publisher of "Oil Paint and Drug Reporter."
1904. Alpers, Wm. C., 4 & 6, White Street, New York City, U.S.A., Manufacturing Chemist.
1889. Alpiar, Agop, Smyrna, Asia Minor, Morphia Manufacturer.
1899. Alsop, Wm. K., 30, Ferry Street, New York City, U.S.A., Chemist.
1901. Alston, Robt., A., New Rietfontein Estates Gold Mines, Ltd., P.O. Knights, Rietfontein, Transvaal, Mining Engineer.
1904. Alton, W., Lester, "Dungarvan," Putney Heath, S.W., Chemist.
1898. Ambler, Chas. Taaffe, Dharhara Station, E.I. Ry., Bengal, India, Mine Owner and Contractor.
1897. Amend, Otto P., 205-211, Third Avenue, New York City, U.S.A., Chemist.
1900. Anderson, Jas. W., The Paddock, Halling, near Rochester, Kent, Analytical Chemist.
1889. Anderson, Robt. T. R., 80, Seedhill Road, Paisley, Technical Chemist.
1894. Anderson, Dr. W. Carriek, 7, Scott Street, Garnet Hill, Glasgow, University Lecturer.
- O.M. Anderton, G. H., Howendyke, Howden, Yorks, Chemical Manufacturer.

- 111

1898. Bailey, Henry, 18, Lavender Sweep, Lavender Hill, S.W., Analytical Chemist.
1888. Bailey, Dr. T. Lewis, Gas Street, Runcorn, Chemist.
1888. Bailey, Sir W. H., Albion Works, Salford, Manchester, Chemical Engineer.
1888. Bailey, Walter P., Fabrica de Productos Amoniacales, 2A, Aguada, Cadiz, Spain, Manufacturing Chemist.
1902. Bain, Jas. Watson, 90, Charles Street, Toronto, Ont., Canada, Chemist.
1890. Baird, H. Harper, 14, Cross Street, Hatton Garden, London, E.C., Laboratory Furnisher.
1902. Baird, Dr. Julian W., Massachusetts College of Pharmacy, Boston, Mass., U.S.A., Professor of Chemistry.
1891. Baird, Wm., c/o Lewis Berger and Sons, Ltd., Homerton, N.E., Technical Chemist.
1895. Baird, W. Raymond, 271, Broadway, New York City, U.S.A., Patent Lawyer.
1899. Bairstow, John, Burley, Queen's Park, Chester, Chemical Works Manager.
1903. Baker, Arthur, 90, Blackburn Road, Darwen, Lancs., Chemist.
1902. Baker, Chas. F., Technical College, Sunderland, Lecturer in Chemistry.
1901. Baker, F. Guy Stirling, Marryatt's Lodge, The Forest, Snaresbrook, Essex, Student.
1883. Baker, Harry, Epworth House, Moughland Lane, Runcorn, Analytical Chemist.
1899. Baker, H. Fenimore, c/o Thomsen Chemical Co., Baltimore, Md., U.S.A., President.
1904. Baker, John T., Easton, Pa., U.S.A., Manufacturing Chemist.
1892. Baker, Julian L., 7, Addison Road, Bedford Park, W., Sugar Chemist.
1886. Baker, Theodore, c/o G. Henry, Pompton Lakes, N.J., U.S.A., Analytical Chemist.
1898. Baldwin, Abram T., Solvay Process Co., Syracuse, N.Y., U.S.A., Alkali Manufacturer.
1903. Baldwin, F. H., Bergenport Chemical Works, Bayonne, N.J., U.S.A., Superintendent.
1903. Baldwin, Dr. H. B., 9-11, Franklin Street, Newark, N.J., U.S.A., Chemist (Dept. of Public Health).
1901. Ball, Edward, c/o B. Young and Co., 24, Dunlop Place, Spa Road, Bermondsey, S.E., Glue and Size Manufacturer.
1903. Ball, S. F., Hull Avenue and 209th Street, Bronx Borough, New York City, U.S.A., Analytical Chemist.
1889. Ballantyne, H., 75, Chancery Lane, London, W.C., Analytical Chemist.
1903. Ballantyne, W. H., 111, Hatton Garden, London, E.C., Patent Agent's Assistant.
1892. Ballard, Ernest, Colwall, Great Malvern, Malt Vinegar Brewer.
1891. Ballinger, Jno., Free Library, Cardiff, Librarian.
1903. Baltzly, E. B., c/o Smet Solvay Co., Syracuse, N.Y., U.S.A., Chemist and Superintendent.
- O.M. Bamber, H. K., 9, Victoria Street, London, S.W., Consulting Chemist.
1894. Bamber, H. K. G., Ingress House, Greenhithe, Kent, Cement Works Chemist and Manager.
1898. Bamford, Harry, 70, Duckworth Terrace, Bradford, Yorks., Dyer.
- O.M. Banister, H. C., Elmhurst, Blundellsands, near Liverpool, Chemical Works Manager.
1890. Banks, Jno. H., c/o Ricketts and Banks, 104, John Street, New York City, U.S.A., Mining Engineer.
1895. Bannan, John F., 59, Court Street, North Andover, Mass., U.S.A., Chemist (Woollen Mill).
1885. Banner, Samuel, 4, Ivanhoe Road, Liverpool, Petroleum Merchant.
- O.M. Bannister, R., 59, Tregunter Road, South Kensington, S.W., Analytical Chemist.
- O.M. Bannister, W., Victoria Lodge, Cork, Ireland, Manufacturing Chemist.
1901. Barber, René R., Georgetown, Ont., Canada, Analytical Chemist.
1892. Barden, Alf., Far Bank, Shelley, near Huddersfield, Glue and Size Maker.
1886. Bardsley, Robt., Messrs. Jewsbury and Brown, Ardwick Green, Manchester, Mineral Water Manufacturer.
1895. Bardwell, Fred. L., Massachusetts Institute of Technology, Boston, Mass., U.S.A., Assistant Professor of Chemistry.
1903. Baringer, Fred. J., Eagle White Lead Works, 1020, Broadway, Cincinnati, Ohio, U.S.A., Chemist.
1902. Barker, Hugh S., 32, Cumberland Avenue, Sefton Park, Liverpool, Laboratory Furnisher.
1895. Barlow, Clinton W., 103-105, Greene Street, New York City, U.S.A., Merchant.
1901. Barlow, John J., 177, Manchester Road, Accrington, Calico Printer's Chemist.
1899. Barlow, Wm., 311, Market Street, Droydsden, near Manchester, Analytical Chemist.
1891. Barnes, Edward A., Dynamite Works, Modderfontein, Transvaal, Technical Chemist.
1901. Barnes, Fred., 46, Park Road, Sittingbourne, Kent, Paper Mill Chemist.
1884. Barnes, H. J., Phoenix Chemical Works, Hackney Wick, N.E., Manufacturing Chemist.
1884. Barnes, Jonathan, 301, Great Clowes Street, Manchester, Analytical Chemist.
- O.M. Barnes, Jos., Green Vale, Westhoughton, near Bolton, Lancashire, Analytical Chemist.
1902. Barnett, Marcus S., Colonial Sugar Refining Co., Ltd., O'Connell Street, Sydney, N.S.W., Australia, Sugar Works Chemist.
1897. Barnett, Robt. E., 9, Virginia Road, Leeds, Headmaster (Leeds Technical School).
1898. Barnicott, Jas. A., Messrs. May and Baker, Ltd., Garden Wharf, Church Road, Battersea, S.W., Chemical Manufacturer.
1904. Baron, Wm. Briscoe, Manchester Steam Users' Association, 9, Mount Street, Manchester, Chemist.
1901. Barr, Geo., Manchester Mills, Manchester, N.H., U.S.A., Calico Printer.
- O.M. Barr, J., Dinting Vale, Dinting, near Manchester, Chemical Manager.
1890. Barraclough, Wm. H., Mortomley, near Sheffield, Analytical Chemist.
1896. Barratt, J. Treeby, Bronheulog, Mostyn, North Wales, Chemist and Manager.
1903. Barreto, Ignacio de Barros, Engenho do Meis Vergea, Pernambuco, Brazil, Manager (Sugar Factory).
1890. Barrett, Arthur A., 5, Strada del Pozzo Leone, Messina, Sicily, Manufacturer of Essential Oils.
1890. Barrie, D. McLaurin, P.O. Box 193, Germiston, Transvaal, Analytical Chemist.
1900. Barrow, Jos., 13, The Grove, Bebbington, Cheshire, Chemist.
1893. Barton, G. E., c/o Whitall, Tatum, and Co., Flint Glass Works, Millville, N.J., U.S.A., Technical Chemist.
1900. Barton, L. Edward, 283-285, Broadway, Albany, N.Y., U.S.A., Chemist.
1903. Bartripp, Geo. F., 51, Pulteney Road, South Woodford, Essex, Analytical Chemist.
1904. Bartsch, Chas. A., 6803, Woodland Avenue, Philadelphia, Pa., U.S.A., Chemist.
1895. Baskerville, Dr. Chas., College of the City of New York, New York, U.S.A., Professor of Chemistry.
1884. Bassett, H., 26, Belitha Villas, Barnsbury, N.
1899. Bassett, Wm. H., Torrington, Conn., U.S.A., Chemist.
1890. Bate, William, c/o National Explosives Co., Ltd., and (Journals) "Ladbroke," Hayle, Cornwall, Technical Chemist.
1903. Bateman, A. H., 34, Bridge Avenue, Hammersmith, W., Chemist.
1903. Bates, C. O., c/o Coe College Library, Cedar Rapids, Iowa, U.S.A., Teacher of Chemistry.
1884. Bateson, Percy, Cuckoo Lane, Gateacre, near Liverpool, Technical Chemist.
1885. Batty, R. B., Wharfedale, Erdington, near Birmingham, Nickel Works Manager.
1903. Baty, E. J., Nunclose, Prince's Avenue, West Kirby, Liverpool, Chemical Student.

1903. Bauer, Geo. W., 632, Sacramento Street, San Francisco, Cal., U.S.A., Vice-President and Chemist (Hop and Malt Co.).
1900. Baur, Jacob, 67, Wells Street, Chicago, Ill., U.S.A., Liquid Carbonic Acid Manufacturer.
1898. Baxter, John G., Nine Elms Cement Works, Cliffe, Kent.
- O.M. Baxter, W. H., Nuthurst, Streatham, S.W., Brewery Director.
1899. Bayly, Francis W., Royal Mint, Sydney, N.S.W., Australia, Assayer.
1904. Bayly, Harold G., 65, Fulham Park Gardens, London, S.W., Analytical Chemist.
- O.M. Baynes, J., Royal Chambers, Seab Lane, Hull, County and Borough Analyst.
1897. Beadle, Alec A., Greenheys, Granville Road, High Barnet, Herts., Electro-Chemist.
1886. Beadle, Clayton, Halewood, Sidcup, Kent, Consulting Chemist.
1890. Bealey, Adam C., c/o A. C. Bealey and Sons, Radcliffe, Lancashire, Bleacher and Alkali Manufacturer.
1904. Bean, Percy, 10, Marsden Street, Manchester, Analytical Chemist.
- O.M. Beanes, E., Moatlands, Paddock Wood, Kent, Manufacturing Chemist.
1905. Beasley, Jno. K. (Journals), c/o The Duff Development Co., Ltd., Kelantan, Federated Malay States, and (communications) 29, Lamont Road, Chelsea, S.W., Metallurgical Chemist.
1883. Beaven, E. S., 5, Borcham Terrace, Warminster, Wilts, Maltster.
1897. Beaver, Chas. J., Stanmore, Cecil Road, Hale, Cheshire, Chemist.
1895. Beehi, G. de H., Walton's Parade, Preston, Lancs., Chemical Engineer.
1898. Beek, Herbert H., 105, South Queen Street, Lancaster, Pa., U.S.A., Chemist.
- O.M. Beckett, G. H., Hartford, South Beach Avenue, Ardrossan, Scotland, Analytical Chemist.
1898. Beckett, Jos. H., 3, Greashore Road, Parkgate, near Rotherham, Analytical Chemist.
1903. Beekwith, Edw., Pierrepont, Garrison on the Hudson, N.Y., U.S.A., Chemist.
1899. Bedford, Alf. C., 26, Broadway, New York City, U.S.A., Chemical Merchant.
1891. Bedford, Chas. S., Rocella, Westwood, Headingley, Leeds, Manufacturing Chemist.
1891. Bedford, Jas. E., Messrs. Wood and Bedford, Airedale Chemical Works, Leeds, Manufacturing Chemist.
- O.M. Bedson, Prof. P. Phillips, Armstrong College, Newcastle-on-Tyne, Professor of Chemistry.
1901. Beebe, Murray C., 2210, Farmer's Bank, Pittsburg, Pa., U.S.A., Engineer.
1901. Beevers, Clifford J., c/o Brotherton and Co., Ltd., Holmes Street, Dewsbury Road, Leeds, Analyst.
1899. Behr, Dr. Arno, Pasadena, Cal., U.S.A., Chemist.
1903. Behrend, F., 54, Front Street, New York City, U.S.A., Importer of Chemical Stoneware.
1902. Behrend, Dr. Otto F., Hammermill Paper Co., Erie, Pa., U.S.A., Vice President.
- O.M. Beilby, G., 11, University Gardens, Glasgow, Chemical Engineer.
1902. Bek, Lars P., Goondi, Johnston River, North Queensland, Australia, Analytical Chemist.
1902. Bell, Edwin L., Vida's Dyes Syndicate, Ltd., West Ferry Road, Millwall, E., Manager.
1884. Bell, Sir Hugh, Bart., Middlesbrough-on-Tees, Soda and Iron Manufacturer.
1900. Bell, Hugh P., 3, Mining Lane, London, E.C., Chemist.
- O.M. Bell, J. Carter, Bank House, The Cliff, Higher Broughton, Manchester, Public Analyst.
1886. Bell, J. Ferguson, Derby Gas Light and Coke Co., Derby, Gas Engineer.
1905. Bell, Miss M. M., Tulane University Library, New Orleans, La., U.S.A., Librarian.
1903. Bell, P. Carter, Milburn, N.J., U.S.A., Chemical Manufacturer.
1902. Bement, Alberto, 218, La Salle Street, Chicago, Ill., U.S.A., Chemical Engineer.
- O.M. Bendix, D., The British Alzium Co., Limited, Silvertown, Victoria Docks, E., Journals to 371, Remford Road, Forest Gate, E., Managing Chemist.
1897. Benfey, Dr. Hays, 2, Sunnyside Terrace, Clayton, Manchester, Manufacturing Chemist.
1903. Benham, Keith, Deans Hill, Stafford, Analytical and Consulting Chemist.
1902. Benjamin, Albert, c/o Thos. Hardcastle and Sons, Ltd., Firwood Works, Bolton, Colnutt and Dyer.
- O.M. Benjamin, Dr. M., Smithsonian Institution, Washington, D.C., U.S.A., Consulting Chemist, A.M.
1904. Benn, R. H. D., 16, Springfield Avenue, Westmount, Montreal, Canada, Analytical Chemist.
1899. Bennett, Alex. H., Chemical Laboratory, 39, Lime Street, E.C., Chemist.
1901. Bennett, Arnold, c/o Saml. Osborn and Co., Clyde Steelworks, Sheffield, Chemist.
1881. Bennett, Thos., Birch Vale, near Stockport, Calico Printer.
1902. Bennie, P. McN., Fitzgerald and Bennie Laboratories, P.O. Box 118, Niagara Falls, N.Y., U.S.A., Consulting Chemist.
1901. Bentley, Wm. H., 6, Woodbine Terrace, Irlam, near Manchester, Technical Chemist.
1890. Bentz, Ernest, 107, Shaw Lane, Dinting, near Manchester, Lecturer on Dyeing.
1897. Berg, Julius, Dürrenbach, bei Wörth a. S. Elsass, Germany, Oil Refinery Manager.
1884. Berringer, J. J., Basset Road, Camborne, Cornwall, Metallurgist.
1893. Berk, Fred. W., 1, Fenchurch Avenue, London, E.C., Chemical Manufacturer.
1903. Berkeley, Dr. Wm. N., Box 466, San Juan, Puerto Rico, U.S. West Indies, Chemist.
1900. Bermingham, Jno., jun., California Powder Works, Pinole, Contra Costa Co., Cal., U.S.A., Superintendent.
1889. Bernard, Jas., jun., Casal das Rolas, Olivares, near Lisbon, Portugal, Chemical Works Manager.
- O.M. Bernays, J., 96, Newgate Street, London, E.C., Civil Engineer.
1900. Berolzheimer, D. D., 1, West 92nd Street, New York City, U.S.A., Chemist.
1897. Berry, Albert E., 62, Claremont Road, Forest Gate, Essex, Works Manager.
1883. Berry, E. E., Bordighera, Italy, Technical Chemist.
1889. Berry, G. F., Atlas Chemical Works, West Ferry Road, Millwall, E., Manager.
1903. Berry, W. G., 329, West 83rd Street, Manhattan Borough, New York City, U.S.A., Chemist.
1886. Best, Dr. T. L., Hardshaw Brook Chemical Works, St. Helens, Lancashire, Technical Chemist.
1901. Betts, Anson G., Troy, N.Y., U.S.A., Chemist.
- O.M. Bevan, E. J., 4, New Court, Lincoln's Inn, London, W.C., Public Analyst and Consulting Chemist.
1900. Bevan, Jno. W., Risolab, St. James' Crescent, Swansea, Manager of Metallurgical Works.
- O.M. Beveridge, Jas., c/o Miramichi Pulp and Paper Co., Ltd., Chatham, N.B., Canada, Pulp and Paper Manufacturer.
1900. Bevington, Col. S. B., 42, St. Thomas Street, Southwark, S.E., Leather Dresser.
1893. Bhaduri, Prof. K., Canning College, Lucknow, India, Professor of Chemistry.
1898. Bhattacharyya, Haripada, Foundry and Shell Factory, Cossipore, Calcutta, India, Chemist.
1896. Bibby, John, c/o J. Bibby & Sons, Formby Street, Liverpool, Student.
- O.M. Bickerdike, W. E., Bryer's Croft, Wiltshire, near Blackburn, Manufacturing Chemist.
1901. Bielecki, Dr. Jan, "Chemicik Polski," 118, Marszałkowska Street, Warsaw, Poland, Chemist.
1903. Bierwirth, L. W., Dover, N.J., U.S.A., Civil Engineer (Lafin and Rand Powder Co.).
1884. Biggart, J. Wm., 29, Cathcart Street, Greenock, N.B., Analytical Chemist.

1891. Biggart, Wm. L., Woodbine, Bridge of Weir, N.E., Public Analyst.
- O.M. Biggs, B., 110, Cannon Street, London, E.C., Chemical Merchant.
- O.M. Billing, H. S., 11, Devon Terrace, Ford Park, Plymouth, Analytical and Managing Chemist.
1896. Billings, Edgar F., 64, Federal Street, Boston, Mass., U.S.A., Manufacturing Chemist.
1896. Billington, Chas., jun., Studleigh, Longport, Staffordshire, Metallurgist.
1898. Binney, Harold, Washington Life Building, 141, Broadway, New York City, U.S.A., Patent Lawyer.
1902. Binning, Stevenson, 101, Shooter's Hill Road, Blackheath, S.E., Technical Chemist.
1903. Binns, John H., Thorndfield, Mystic Pond, Methuen, Mass., U.S.A., Dyer and Finisher.
1896. Bird, Arthur W., 10, Norfolk Square, London, W., Works Engineer.
1896. Bird, Jno. B., Minver House, 61, Bateman Street, Cambridge, Manure Manufacturer.
1903. Bird, Thos., 59A, Brook Street, Grosvenor Square, London, W., Surgeon.
1902. Bird, W. Robt., 217, Newport Road, Cardiff, Oil Merchant.
1895. Bird, Wm. R., (communications) 125, Goddard Avenue; (Journals) Laboratory, G.W.R. Works, Swindon, Wilts., Analytical Chemist.
1885. Birley, R. K., c/o Chas. Macintosh and Co., Ltd., Cambridge Street, Manchester, India-rubber Manufacturer.
1883. Bishop, A. Conway, Three Mills Lane, Bromley-by-Bow, E., Manufacturing Chemist.
1884. Bishop, Fred., c/o Burmah Oil Co., Rangoon, Burmah, Technical Chemist.
- O.M. Bishop, G. A., 38, Sherbrooke Avenue, Maxwell Park, Glasgow, Mining Engineer.
1903. Bishop, Howard B., 609, Greene Avenue, Brooklyn, N.Y., U.S.A., Chemist.
1903. Bishop, J. T. F., Chemical Club, Manchester, Secretary.
1905. Bjerregaard, August P., c/o Emil Cahnan & Co., Long Island City, N.Y., U.S.A., Varnish Chemist.
1904. Black, J. Wyclif, 20, Mardale Crescent, Edinburgh, Analytical Chemist.
1902. Black, W. Geoffrey, 9, Routh Road, Wandsworth Common, S.W., and (Journals) Malvern, Bradford Street, Bocking, near Braintree, Chemist.
1894. Blackmore, H. S., 206, South Ninth Avenue, Mount Vernon, N.Y., U.S.A., Chemist (Pure Aluminium and Chemical Company).
1899. Blackwell, G. G., 44-47, The Albany, Liverpool, Mineral and Metal Merchant.
1896. Blagden, Victor, 50-51, Lime Street, London, E.C., Chemical Merchant.
1883. Blagden, W. G., The Manor House, Harting, near Petersfield, Chemical Merchant.
1897. Blair, Andrew A., 406, Locust Street, Philadelphia, Pa., U.S.A., Analytical Chemist.
1884. Blake, Jas., Thames Sugar Refinery, Silvertown, E., Manager.
1902. Blakemore, Geo. H., Great Cobar Copper Mine, Cobar, N.S.W., Australia, Metallurgist.
1890. Blakey, A. J., Dudbridge Mills, Stroud, Gloucestershire, Dyer.
1891. Blass, Edw., Essen (Ruhr), Germany, Civil Engineer.
1904. Bleakley, Wm., Dean's Mill, Swinton, Lancs., Cotton Mill Manager.
1893. Blears, John, c/o Langworthy Bros. and Co., Ltd., Greengate Mills, Salford, Dyer and Calico Printer.
- O.M. Bles, A. J. S., 32, Chorlton Street, Manchester, Chemical Merchant.
1889. Bloede, Victor G., Station D., Baltimore, Md., U.S.A., Manufacturing Chemist.
1891. Bloomer, Fred. J., Penpont, Clydach, R.S.O., Glamorgan, Nickel Works Manager.
1886. Blount, Bertram, Laboratory, 76 and 78, York Street, Westminster, S.W., Analytical Chemist.
1888. Bloxam, A. G., Birkbeck Bank Chambers, Chancery Lane, W.C., Chemist and Patent Agent.
1890. Bloxam, W. Popplewell, 25, Upper Bedford Place, London, W.C., Research Chemist.
1903. Blumenthal, Lionel, 25, Lever Street, Piccadilly, Manchester, Chemist.
1886. Blundstone, E. R., Heathfield, Park Road, Hampton Hill, Middlesex, Consulting Chemist.
1905. Blyth, Thomas R., Uphall Chemical Works, Ilford, Essex, Analytical Chemist.
- O.M. Boake, A., Warton Road, Stratford, E., Manufacturing Chemist.
1888. Boake, Edmund J., Aberffraw, Nursery Road, Loughton, Essex, Manufacturing Chemist.
1885. Board, J. T., Cheese Lane, Bristol, and (Journals) Roseneath, Willsbridge, near Bristol, Distiller.
1899. Boehm, Fred., 16, Jewry Street, London, E.C., Chemical Agent and Merchant.
1905. Bogardus, Chas. E., 90, Columbia Street, Seattle, Wash., U.S.A., Assayer and Chemist.
1898. Bogert, Prof. Marston T., Department of Organic Chemistry, Columbia University, New York City, U.S.A., Instructor in Organic Chemistry.
1903. Boissevain, Chas. E. H., 92, van Eeghenstraat, Amsterdam, Holland, Chemical Manufacturer.
1903. Bolam, Dr. H. W., 2, Summerfield, Leith, N.B., Lecturer on Chemistry.
1901. Bolton, E. Richards, 16, Flanchford Road, Ravenscourt Park, W., Manufacturing Chemist.
1905. Bond, John, Crowlands, Southport, Engineer.
1892. Bookman, Dr. S., 9, East 62nd Street, New York City, U.S.A., Chemist.
1888. Boor, Leonard G., 39, Mincing Lane, London, E.C., Chemical Merchant.
1896. Boot, John C., Klatten, Java, Netherlands Indies, Chemist.
1904. Booth, N. Parr, Laboratory, Cadbury Bros., Ltd., Bournville, near Birmingham, Chemist.
1894. Booth, Robt., 110, Cannon Street, London, E.C., Engineer.
1891. Boothby, Chas., 70, Bedford Court Mansions, Bedford Square, London, W.C., Chemist.
1903. Boral, Robin, Rhodes Mount, Rhodes, near Manchester, Works Manager.
1897. Borland, C. R., P.O. Box 683, Concord, Mass., U.S.A., Smokeless Powder Manufacturer.
- O.M. Borland, W.D., Beacon Lodge, Bean, *via* Dartford, Kent, Explosives Chemist.
1903. Boroschek, Dr. L., 149, East 56th Street, New York City, U.S.A., Chemist.
1903. Bossi, Dr. Arnold L., Arnold Print Works, North Adams, Mass., U.S.A., Assistant Manager.
1890. Bost, W. D., Ashton, Cartvale Chemical Works, Paisley, N.B., Chemical Manufacturer.
- O.M. Bothamley, C. H., Tanglewood, Southside, Weston-super-Mare, Somerset, County Director of Technical Instruction.
1890. Bott, Dr. W. Norman, 16, St. Helen's Place, London, E.C., Consulting Chemist.
1884. Böttinger, Dr. H. T., Elberfeld, Germany; and (subs.) c/o The Bayer Co., Ltd., 19, St. Dunstan's Hill, E.C., Colour Manufacturer.
- O.M. Bottle, Alex., 4, Godwyne Road, Dover, Pharmaceutical Chemist.
1901. Bottomley, Dr. J. Frank, 21, Wentworth Place, Newcastle-on-Tyne, Consulting Chemist.
- O.M. Boulton, H. E., 64, Cannon Street, London, E.C., Chemical Manufacturer.
1890. Boulton, James, Crayford, Mills, Stratford, E., Manufacturing Chemist.
- O.M. Boulton, S. B., 64, Cannon Street, London, E.C., Chemical Manufacturer.
1883. Boulton, T. S., 14, Freegrove Road, Caledonian Road, N., Manager.
1900. Bourcoud, Augustin E., Comp. General de Produits Químicos del Abafio, Gijón, Spain, Civil Engineer.
1902. Bousfield, E. G. P., c/o Ozonised Oxygen Co., Ltd., 20, Mount Street, Manchester, Electro-Chemist.
1884. Bow, R. H., 7, South Gray Street, Edinburgh, Civil Engineer.

1904. Bowden, Thos., Starring Grove, Studley, Little-borough, Lancs., Dyer and Chemist.
1905. Bowen, Henry, c/o St. Louis Chemical Co., St. Louis, Mich., U.S.A., Secretary.
1885. Bowen, S. B., Brickfield Chemical Works, Manely, South Wales, Chemical Manufacturer.
1899. Bowen, Wm., Rockingham, Cecil Road, Erdington, Birmingham, Chemist.
1888. Bower, Frank, Brewery House, Spitalfields, E., Analytical Chemist.
1897. Bower, Wm. H., 29th Street and Gray's Ferry Road, Philadelphia, Pa., U.S.A., Chemical Manufacturer.
1892. Bowes, Harry, 40, Radford Street, Blackley, Manchester, Analytical Chemist.
1903. Bowey, John, jun., 567, Dufferin Avenue, London, Ont., Canada, Chemist.
1889. Bowing, Jno., 101, North Street, Wandsworth, S.W., Consulting Chemist.
1883. Bowley, Jos. John, Wellington Works, Battersea Bridge, and (Journals) 61, Redcliffe Gardens, London, S.W., Chemical Manufacturer.
1899. Bowley, J. Plunkett, 1, Wellington Road, Battersea, and (Journals) 61, Redcliffe Gardens, London, S.W., Varnish Manufacturer.
1883. Bowman, Dr. F. H., Spinningfield, Deansgate, Manchester, Chemical Manufacturer.
1894. Bowman, Jas. H., Canada Chemical Manufacturing Co., London, Ont., Canada, Chemist.
1884. Bowman, R., Cynwyd, near Corwen, N. Wales, Chemical Manufacturer.
1896. Bowman, Walker, 39, Cortlandt Street, New York City, U.S.A., Chemist.
1904. Boyce, Framroze H., City of Bombay Manufacturing Co., Ltd., 39, Hornby Road, Bombay, India, Technical Chemist.
1893. Boyce, Frank, c/o Goodall, Backhouse, and Co., White Horse Street, Leeds, Technical Chemist.
1884. Boyd, Pythagoras, 17, Union Street, North Adams, Mass., U.S.A., Print Works Superintendent.
- O.M. Boyd, W., P.O. Box 143, Germiston, Transvaal, Technical Chemist.
1899. Boyes, Herb. J., Mameda, Barao de Piracicula, Sao Paulo, Brazil, Chemist.
1902. Brach, Dr. Ludwig K., Chemist and Colourist.
1885. Bradburn, J. A., Chemical Engineer.
1883. Bradbury, A., Queen Buildings, 11, Dale Street, Liverpool, Chemical Broker.
1902. Bradbury, S., Thornham New Road, Castleton, Manchester, Chemist.
1895. Bradford, Henry, c/o W. H. Gorringe, Southampton House, Southwick, near Brighton, Analytical Chemist.
1904. Brading, R. W., Casella, Sandal Road, New Malden, Surrey, Builder.
1896. Bragg, Everett B., 1745, Chicago Avenue, Evanston, Ill., U.S.A., Manufacturing Chemist.
1891. Braithwaite, Isaac, Kendal, Westmoreland, Dry-salter.
1897. Braithwaite, Jno. O., Hilika, Warren Road, Chingford, Essex, Pharmaceutical Research Chemist.
1904. Brame, Winfred W., State College, Pennsylvania, U.S.A., Assistant Instructor.
1903. Brame, J. S. S., 5, Coleraine Road, Blackheath, S.E., Demonstrator in Chemistry.
- O.M. Bramham, W., 86, Bow Road, London, E., and (communications) 115, Broadhurst Gardens, West Hampstead, N.W., Chemical Engineer.
- O.M. Bramwell, Major E., Chemical Works, St. Helens, Lancashire, Chemical Manufacturer.
- O.M. Bramwell, G. H., Cowley Hill, St. Helens, Lancashire, Alkali Manufacturer.
1904. Brandeis, R., Oesterreichischer Verein f. Chem. und Metall. Production, Aussig, Austria, Chemical Manufacturer.
1902. Branegan, Jas. Aug., 4523 North Uber Street, Philadelphia, Pa., U.S.A., Chemical Salesman.
- O.M. Branson, F. W., Wynneholme, Far Headingley, Leeds, Pharmaceutical Chemist.
1903. Brassard, Fred., c/o 46, Ave. of Lane, Bradford, Yorks, Audine Cotton Importer.
1901. Brearby, Harry, Salzwander, Stollwerke, Jaegel, Riga, Russia, Analytical Chemist.
1888. Brettitt, Wm., Glasshouse Lane, Cuffley, Yorks., Glass Manufacturer.
1888. Bressey, Edw., 299, Renford Road, Stratford, E., Gold and Silver Refiner.
1901. Brewer, Dr. C. E., Wade Park, N.C., U.S.A., Professor of Chemistry.
1900. Brewis, E. Theodore, 21, Belgrave Road, Leyton, E., Chemist.
1894. Breyer, Theodore, c/o Warner Sugar Refining Co., Wankegan, Ill., U.S.A., Chemist.
1885. Briant, L., 24, Holborn Viaduct, London, E.C., Analytical Chemist.
1890. Brierley, J. T., Highfield, Golden Hill, Leyland, near Preston, Lancs., Analytical Chemist.
1894. Briggs, J. Burnett, Vauxhall Soap Works, 6, Blackstock Street, Liverpool, Soap Manufacturer.
1893. Briggs, J. F., 2, Frankfort Road, Herne Hill, S.E., Sugar Works Chemist.
1885. Briggs, T., Lynton, 188, Central Avenue, Flushing, Long Island, N.Y., U.S.A., Technical Chemist.
1886. Briggs, Wm., 13, Panmure Street, Dundee, Manufacturing Chemist.
1890. Brindley, G. E., c/o Niagara Electro-Chemical Co., Niagara Falls, N.Y., U.S.A., Chemical Engineer.
1886. Bristow, G. W., 10, Philpot Lane, London, E.C., Chemical Manager.
1887. Broadbent, H., c/o Goodall, Backhouse, and Co., Sovereign Street, Leeds, Chemist.
1896. Broadhurst, W. Homer, 299, Lafayette Avenue, Brooklyn, N.Y., U.S.A., Chemist.
1889. Brock, Arthur, Firework Factory, Sutton, Surrey, Firework Manufacturer.
- O.M. Brock, J., Gwern-Tyno, Colwyn Bay, North Wales, Chairman of United Alkali Co., Ltd.
1896. Brooke, C. B., jun., Colne House, Brantham, near Manningtree, Xylonite Manufacturer.
1900. Brooke, Jno. R., Chemical Laboratory, 20, Cullum Street, London, E.C., Chemist.
1884. Brookes, E. A., c/o The Chilian Mills Co., Ltd., Chiguayante, Concepcion, Chile, Chemist.
1895. Brookman, Fred W., 8, West Street, Rochdale, Manure Works Manager.
1903. Brooks, H. Kibbe, Swanton, Vermont, U.S.A., Chemist.
1893. Broome, F. S. J., Lenholme, Holloway, near Matlock Bath, Derbyshire, Assayer.
1901. Broome, Jos., 40, East 30th Street, Bayonne, N.J., U.S.A., Chemical Engineer.
- O.M. Brotherton, E. A., M.P., Commercial Buildings, Leeds, Ammonia Distiller.
1884. Brown, Prof. A. Crum, F.R.S., 8, Belgrave Crescent, Edinburgh, Professor of Chemistry.
1902. Brown, A. H., c/o Daly Reduction Co., Hedley, B.C., Canada, Metallurgist.
1891. Brown, Cesar R., 23, Gower Road, Forest Gate, E., Works Foreman.
- O.M. Brown, D., 93, Abbey Hill, Edinburgh, Chemical Manufacturer.
- O.M. Brown, D., Donaghmore, Tyrone, Ireland, Soap Manufacturer.
1890. Brown, Edw. Hilton, c/o W. Ropes and Co., St. Petersburg, Russia, Analytical Chemist.
1903. Brown, Frank C., P.O. Box 211, Framingham, Mass., U.S.A., Foreman.
1904. Brown, Fred W., 470, Lenox Avenue, New York City, U.S.A., Chemist.
1894. Brown, Geo. E., c/o "The British Journal of Photography," 24, Wellington Street, Strand, London, W.C., Chemist.
1905. Brown, Harold G. S., c/o Messrs. G. H. Ogston and Moore, Strada degle Argentieri, 19, Messina, Sicily, Analyst.
- O.M. Brown, Henry, Benskin's Brewery, Watford, Herts., Brewing Chemist.
1899. Brown, Dr. Henry C., The Chemical Works, King's Lynn, Chemical Manufacturer.

- O.M. Brown, Dr. Horace T., F.R.S., 52, Nevern Square, Kensington, S.W., Brewing Chemist.
- O.M. Brown, Dr. J. Campbell, 8, Abercromby Square, Liverpool, Professor of Chemistry.
1891. Brown, J. Henry, Minas d'Aljustrel Alemtejo, Portugal, Technical Chemist.
1901. Brown, Jos., Ashleigh House, Savile Town, Dewsbury, Manufacturing Chemist.
1892. Brown, Reginald B., c/o Badische Co., Ltd., 2, Samnel Ogden Street, Manchester, Technical Chemist.
1889. Brown, Robt., The Firs, Hartford, Northwich, Engineer.
1901. Brown, Samuel B., Loveclough, Rawtenstall, Lancashire, Calico Printer's Manager.
- O.M. Brown, Walter, c/o Jas. H. Dennis and Co., Ltd., Widnes, Technical Chemist.
1900. Brown, Walter B., Victor Chemical Works, Chicago Heights, Ill., U.S.A., Chemist.
1904. Brown, W. Anderson, 104, Kingston Road, Hford, Essex, Soap Analyst.
1897. Brown, Wm., Terrace House, The Cliff, Higher Broughton, Manchester.
1901. Browne, Dr. Arthur L., 13-15, North Street, Baltimore, Md., U.S.A., Analytical Chemist.
1903. Browne, Dr. Chas. A., jun., Audnon Park, New Orleans, La., U.S.A., Sugar Chemist.
- O.M. Browning, W., Broad Oak, Accrington, Calico Printer.
1901. Brownlie, David, 11, Langford Road, Heaton Chapel, near Manchester, Chemist.
1902. Brownrigg, Marcus P., Colonial Sugar Refining Co., Ltd., O'Connell Street, Sydney, N.S.W., Australia, Analytical Chemist.
1902. Brownsdon, Dr. H. W., King's Norton Metal Co., Ltd., Abbey Wood, Kent, Works Chemist.
1902. Bruce, Alex., Laboratory, Hyde Park Corner, Colombo, Ceylon, Chemist.
1890. Bruce, Jas., 2, Kirkliston Drive, Bloomfield, Belfast, Ireland, Distiller.
1900. Bruce, Wm. T., c/o Hugh Wallace and Co., Ltd., 5, Fenchurch Street, London, E.C., Director.
1892. Bruckmann, G. T., 192, 18th Street, Brooklyn, N.Y., U.S.A., Chemical Engineer.
1905. Bruhier, A. G., 534, Canal Street, New York City, U.S.A., U.S. Agent for Kalle and Co.
- O.M. Brunner, H., Holly Mount, Tarbock Road, Huyton, near Liverpool, Chemical Manufacturer.
1894. Brunner, H. Bertram, Winnington Park, Northwich, Chemist and Electrician.
1887. Brunner, J. F. L., c/o Brunner, Mond and Co., Ltd., 39, Victoria Street, London, S.W., Chemical Manufacturer.
- O.M. Brunner, Sir J. T., Bart., M.P., Druid's Cross, Wavertree, Liverpool, Chemical Manufacturer.
1902. Brunner, Roscoe, c/o Messrs. Brunner, Mond and Co., Ltd., Northwich, Alkali Manufacturer.
1894. Brunton, J. Dixon, Wire Mill, Musselburgh, N.B., Wire Manufacturer.
1904. Bryant, Arthur P. (communications) c/o Glucose Sugar Refining Co., West Taylor Street and River, and (Journals) 661, Winthrop Avenue, Chicago, Ill., U.S.A., Chemist.
1903. Bryant, V. Seymour, The Bank, Camberne, Cornwall, Analytical Chemist.
1905. Bryce, Clarence H., c/o Benj. Moore and Co., 244, Water Street, Brooklyn, N.Y., U.S.A., Factory Superintendent.
1894. Bryce, Thos., Tharsis Mines, Huelva, Spain, Chemist.
1897. Bryson, Jas., Pumpherton Oil Works, Midealder, N.B., Oil Works Manager.
1892. Buchanan, D. G., (Subs.) Mount Vernon House, Glasgow, and (Journals) c/o Gibbs and Co., Iquique, Chili, Analyst.
1902. Buchanan, Duncan, G., 500, Church Street, Toronto, Ont., Canada, Chemist.
1904. Buchanan, E. F., 712, Payne Avenue, Akron, Ohio, U.S.A., Chemist.
1888. Buchanan, Jas., jun., Caledonia Foundry, Brasenose Road, Liverpool, Engineer.
1904. Buchanan, Joshua D., c/o Nobel's Explosives Co., Ltd., Polmont Station, N.B., Chemist.
1904. Buchanan, J. L., 27, Birch Road, Lower Bebington, Cheshire, Analytical Chemist.
1897. Bucher, Prof. John E., Brown University, Providence, R.I., U.S.A., Assistant Professor.
1897. Buck, Chas. A., 521, Locust Street, South Bethlehem, Pa., U.S.A., Chief Chemist (Bethlehem Iron Co.).
1897. Buckmill, Jno. A., P.O. Box 52, Government Patent Office, Pretoria, Transvaal, Comptroller General.
- O.M. Budden, E. R., Park View, Eversleigh Road, Finchley, N., Consulting Chemist.
1900. Bull, Dr. Benjamin S., 104, Humber Road, Blackheath, S.E., Technical Chemist.
1902. Bull, Irving C., P.O. Box, 294, Middletown, N.Y., U.S.A., Chemist.
- O.M. Bullock, J. L., 3, Hanover Street, Hanover Square, London, W., Manufacturing Chemist.
1899. Bult, Herbert J., 18, Billiter Street, London, E.C., Chemist.
- O.M. Bumby, H., Coltness Ironworks, Newmains, N.B., Ironworks Manager.
- O.M. Bunker, H. E., 19, Napier Street, Toronto, Ont., Canada, Technical Chemist.
1901. Bunting, Henry H., c/o Peruvian Corporation, Ltd., Lima, Peru, Analyst.
1894. Bunting, W., Lightfoot, Forest Bank, Crawshawbooth, near Manchester, Calico Printer.
1905. Bunzl, Hugo, 175, High Street, Chorlton on Medlock, Manchester, Chemist.
1893. Burbidge, Jas., India-rubber Mills, Tottenham, N., India-rubber Manufacturer.
1886. Burdekin, G., jun., Heathfield, Prescott Road, St. Helens, Chemical Works Manager.
1896. Burford, Samuel F., The Firs, Kirby Muxloe, near Leicester, Analytical Chemist.
1898. Burge, Chas. H., Government Laboratory, Clement's Inn Passage, Strand, W.C., Analyst.
1889. Bürger, Dr. J., 1, Birch Avenue, Talbot Road, Old Trafford, Manchester, Technical Chemist.
1901. Burgess, Prof. C. F., University of Wisconsin, Madison, Wis., U.S.A., Electro-chemical Engineer.
1889. Burgess, Geo., Hale Road, Ditton, Widnes, Chemist.
1889. Burgess, Wm. T., 20, Priory Road, Bedford Park, London, W., Analytical Chemist.
1902. Burkard, Dr. Ernst, The Heyden Chemical Works, Garfield, N.J., U.S.A., Chemist.
1899. Burkhardt, Dr. G., Pragerstrasse 12, Wilmersdorf-Berlin, Germany, Chemist.
1897. Burland, Lt.-Col. Jeffrey H., 824, Sherbrooke Street, Montreal, Canada, Paper and Card Manufacturer.
1896. Burland, Richard O., Bishopsgate, Wigan, Manufacturing Chemist.
1900. Burleigh, Wm. F., c/o Murphy Varnish Co., Newark, N.J., U.S.A., Technical Chemist.
1897. Burls, Frank B., 4, Dyers Hall Road, Leytonstone, Essex, Chemist.
1898. Burls, Herbert T., (Journals) c/o Royal Societies Club, St. James Street, S.W., and (communications) Foulis Terrace, Onslow Gardens, S.W., Mechanical Engineer.
1901. Burnand, Sydney, Manbré Saccharine Co., Ltd., Hammersmith, W., Manager.
- O.M. Burnard, R., Plymouth Chemical Works, Plymouth, Chemical Manufacturer.
1891. Burnet, Henry K., North Brook Vitriol Works, Bradford, Yorks., Sulphuric Acid Maker.
1897. Burnet, Jno. Jas., 18, University Avenue, Glasgow, Architect.
1893. Burnham, J. C., Cordite Factory, Wellington, Nilgiri Hills, India, Analytical Chemist.
1900. Burnside, Chas. F., c/o International Smokeless Powder Co., Parlin, N.J., U.S.A., Chemist.
1900. Burr, Edmund C., 1722, Vallejo Street, San Francisco, Cal., U.S.A., Manufacturer.
- O.M. Barrell, B. A., 8, Springfield Mount, Leeds, Analytical Chemist.
1892. Burrough, Horace, jun., 503, West Lombard Street, Baltimore, Md., U.S.A., Technical Chemist.
1888. Burrows, Edw., Home Villa, Low Fell, Gateshead-on-Tyne, Alkali Works Manager.

1905. Burtenshaw, Wm. H., P.O. Box 814, Detroit, Mich., U.S.A., Secretary, Michigan Carbon Works.
1901. Burton, Alf., 114, Bedford Road, Toronto, Canada, Dyer and Finisher.
1903. Burton, Jno., 2, Green Street, Bethnal Green, E., Dye and Chemical Manufacturer.
1904. Burton, T. R., c/o Scott, Greenwood and Co., 19, Ludgate Hill, London, E.C., Technical Journalist.
1889. Burton, Wm., The Hollies, Clifton Junction, near Manchester, Potter's Chemist.
1897. Burwell, A. W., Kyle Street, Lakewood, *via* Cleveland, Ohio, U.S.A., Consulting Chemist.
1885. Bury, J. H., Church Chemical Works, near Averington, Chemical Manufacturer.
1897. Bush, J. M., c/o W. J. Bush and Co., Ltd., Ash Grove, Hackney, E., Manufacturing Chemist.
1897. Butler, David B., 41, Old Queen Street, Westminster, S.W., Cement Expert.
1903. Butler, Fredk., Ash Lane, Hough Green, near Widnes, Manager (Ditton Copper Works).
1890. Butler, Paul, Lowell, Mass., U.S.A., Ammunition Manufacturer.
1885. Butler, Samuel, The Cedars, Compton, Wolverhampton, Brewer.
1886. Butler, W. W., Southfield, Norfolk Road, Edgbaston, Birmingham, Brewer.
1903. Buttenshaw, E. L., 31, Edge Lane, Chorlton-cum-Hardy, Manchester, Analytical Chemist.
- O.M. Butterfield, J. C., 79, Endlesham Road, Balham, S.W., Analytical Chemist.
1892. Butterfield, W. J. A., 66, Victoria Street, Westminster, S.W., Analytical Chemist.
1897. Butters, Charles, 28-31, Bishopsgate Street Within, London, E.C., and (Journals) Ros-dawn, Oakland, Cal., U.S.A., Metallurgist.
1900. Butterworth, Elwell R., c/o Reversible Collar Co., 111, Putnam Avenue, Cambridge, Mass., U.S.A., Chemist.
1902. Butterworth, F. J., P.O. Box 51, Newark, N.J., U.S.A., Chemist.
1892. Buttfeld, Horace V., 13, Wellington Road, Bush Hill Park, Enfield, N., Chemical Demonstrator.
- O.M. Byard, A. G., c/o Burt, Boulton, and Haywood, Apartado, 8, Bilbao, Spain, Technical Chemist.
1899. Byrnes, Eugene A., c/o Byrnes and Townsend, 918, F. Street, N.W., Washington, D.C., U.S.A., Patent Lawyer.
1893. Byron, T. H., Laboratory, Wigan Coal and Iron Co., Wigan, Analytical Chemist.
1887. Bythway, M., 44, Lloyd Street, Albert Square, Manchester, Drysalter.
1884. Cabot, Godfrey L., 82, Water Street, Boston, Mass., U.S.A., Chemist.
1889. Cadett, Jas., Ashted, Surrey, Chemical Engineer.
1902. Cady, Walter B., c/o Wabash Portland Cement Co., Strohn, Ind., U.S.A., Chemist.
1901. Cady, Wm. H., 127, Power Street, Providence, R.I., U.S.A., Colour Chemist.
1905. Cain, Dr. J. C. (Journals) 28, Pembury Road, Lower Clapton, N.E., and c/o Brooke, Simpson and Spiller, Ltd., Hackney Wick, N.E., Manager and Head Chemist.
1891. Caines, G. S. A., 7, Rochester Terrace, Camden Road, London, N.W., Analytical Chemist.
1900. Cairns, Adam, Thistle Rubber Mills, 98, Commerce Street, Glasgow, Manager.
1897. Cairns, Wm., 5, Carlton Place, Glasgow, Plumber.
1891. Caldecott, W., Arthur, Box 67, Johannesburg, Transvaal, South Africa, Metallurgist.
1905. Calder, Prof. Edwin E., Long Meadow, R.I., U.S.A., Professor of Chemistry.
1897. Calder, W. A. S., Ormeau, Little Moor Hill, Smethwick, Chemical Manufacturer.
1888. Caldwell, Wm., Murray Street, Paisley, N.B., Dry-salter.
1891. Calkin, Wm. S., Spring Forge, Pa., U.S.A., Paper Pulp Works Chemist.
1902. Calm, Chas. E., 190, Michigan Street, Chicago, Ill., U.S.A., Manufacturing Chemist.
1904. Calvert, Harry T., West Riding of Yorkshire Rivers Board, Wakefield, Chemist.
1901. Calvert, Jos. E., 293, Butler Street, Etna, Allegheny Co., Pa., U.S.A., Analytical Chemist.
1899. Calvert, Sidney, State University, Columbia, Mo., U.S.A., Professor of Chemistry.
1895. Cambier, Jacob, 919, Spruce Street, Pueblo, Colo., U.S.A., Chemist.
1894. Cameron, Alex., Whitechapel, Rochester Road, Camden Road, N.W., Chemical Engineer.
1891. Cameron, Jas., Ingleby, Woodley, near Birkenhead, Chemist.
1904. Cameron, Walter S., 239, West 136th Street, New York City, U.S.A., Manufacturing Perfumer.
- O.M. Cammack, J., 51, Denton's Green Lane, St. Helens, Lancashire, Technical Chemist.
1886. Campbell, Andrew, c/o Burnah Oil Co., Ltd., Dumfries, Rangoon, Burma, Analytical Chemist.
- O.M. Campbell, Archibald, Berry Lodge, Rugeley, Staffordshire, Technical Chemist.
1902. Campbell, Ashley, Colonial Sugar Refining Co., Ltd., Yarraville Refinery, Melbourne, Vic., Australia, Analytical Chemist.
1899. Campbell, Jas. Emrys, 22, Shirley Street, Worcester, Mass., U.S.A., Chemical Engineer.
1886. Campbell, John, 75, Hudson Street, New York City, U.S.A., Dye Manufacturer.
1904. Campbell, J. H., 41, Summit Street, Brooklyn, N.Y., U.S.A., Chemist.
1901. Campbell, Kenneth F., M.Inst.C.E., 1, Peel Street, Huddersfield, Civil Engineer.
1904. Campion, A., Laboratory, 144 Wellington Street, Glasgow, Chemist and Metallurgist.
1897. Canfield, F. D., jun., c/o Cuban Sugar Refining Co., Cardenas, Cuba, Sugar Refiner.
1893. Cannon, J. C., Danchurst, Gordon Road, Shoreham, Sussex, Analyst.
- O.M. Cannon, M., 25, Stormont Road, Clapham Common, S.W., Vinegar Works Manager.
1891. Canziani, Enrico, 3, Palace Green, Kensington, W., Civil Engineer.
1905. Capen, Geo. H., Canton Junction, Mass., U.S.A., Manufacturer of Leather Pressings.
1891. Carden, Albert J., Dunster House, 12, Mark Lane, E.C., Distiller.
1904. Card, Prof. Hubert C., Laboratory, University of Minnesota, Minneapolis, Minn., U.S.A., Chemist. (State Board of Health).
1893. Carey, Arthur, 1, Grassendale Road, Cressington, near Liverpool, Chemist.
- O.M. Carey, Estuace, The United Alkali Co., Ltd., 39 James Street, Liverpool, Chemical Manufacturer.
1904. Cargill, J. T., c/o Finlay, Fleming and Co., Rangoon, Burma, East India Merchant.
1904. Carhart, Dr. C., c/o Mr. Berk Talley, Rama, Nicaragua, Pharmacist.
- O.M. Carile, T., St. Bryde's, Dunblane, N.B., Chemical Manufacturer.
1895. Carlsson, Hugo, 42, Smolundsgatan, Stockholm, Sweden, Analytical Chemist.
1893. Carmichael, Dr. H., 176, Federal Street, Boston, Mass., U.S.A., Analytical Chemist.
1896. Carmichael, Herbert, Bureau of Mines, Victoria, British Columbia, Public Analyst and Assayer.
1884. Carmody, Prof. Patrick, Government Laboratory, Port of Spain, Trinidad, Analytical Chemist.
1903. Carneiro da Cunha, J. M., Comp. Agricola and Mercantil, Rua do Apollo, 28, Pernambuco, Brazil, Manager.
1897. Carnell, Wm. C., c/o Tacony Chemical Works, Bridesburg, Philadelphia, Pa., U.S.A., Chemist.
- O.M. Caro, Dr. H., Mannheim, Germany, Technical Chemist.
1893. Carpenter, C. C., South Metropolitan Gas Co., 709A, Old Kent Road, London, S.E., Civil Engineer.
1900. Carpenter, Frank B., Crenshaw Building, Richmond, Va., U.S.A., Chemist.

1900. Carpenter, Harry B., c/o Lister's Agricultural Chemical Works, Newark, N.J., U.S.A.
1903. Carpenter, H. C. Harold, The National Physical Laboratory, Bushy House, Teddington, Middlesex, Chemist and Metallurgist.
- O.M. Carpenter, R. Forbes, Prestwich, Greencroft Gardens, West Hampstead, N.W., Chief Inspector under the Alkali, &c., Works Acts.
1904. Carr, Francis H., Kelvin, Church Avenue, Sidecup, Kent, Manufacturing Chemist.
1904. Carroll, Jno. L., 23, Division Place, Newark, N.J., U.S.A., Secretary (American Oil and Supply Co.).
1885. Carruthers, J. G., Burnbrae House, Milngavie, N.B., Dyeworks Manager.
1901. Carson, Geo. C., Hotel Broadway, Denver, Colo., U.S.A., Mining Engineer.
- O.M. Carteighe, M., 180, New Bond Street, London, W., Pharmaceutical Chemist.
1904. Carter, A., Cuba Street, Petone, Wellington, New Zealand, Works Manager.
1902. Carter, Jno. P., 626, South 24th Street, Philadelphia, Pa., U.S.A., Analytical Chemist.
1905. Carter, Robert A., c/o Roessler and Hasslacher Chemical Co., 100, William Street, New York City, U.S.A., Chemist.
1895. Carter, Stewart F., Windsor Printworks, North Adams, Mass., U.S.A., Technical Chemist.
1903. Carter, Thomas, 322, Scurr Hill, Bradford, Yorks, Works Chemist.
1886. Carter, W. Chas., c/o Dominion Iron and Steel Co., Sydney, C.B., Canada, Analytical Chemist.
1889. Carulla, F. J. R., 84, Rose Hill Street, Derby, Chemical Manufacturer.
1903. Caspari, Dr. W. A., 28, Coleshill Road, Teddington, Chemist and Physicist.
1895. Catlin, Chas. A., 133, Hope Street, Providence, R.I., U.S.A., Chemist (Rumford Chemical Works).
1896. Caven, Robt. M., University College, Nottingham, Lecturer in Chemistry.
- O.M. Cawley, G., 25, Victoria Street, Westminster, S.W., Chemical Engineer.
- O.M. Cawley, J., 278, Passaic Street, Newark, N.J., U.S.A., Analytical Chemist.
1897. Cawley, Thos. A., British Gelatin Works, New Bedford Road, Luton, Gelatin Manufacturer.
1900. Cayvan, Llewellyn L., 4647, Indiana Avenue, Chicago, Ill., U.S.A., Chemist.
1902. Cerasoli, Alberto, c/o Dr. L. Mond, 18, Avenue Rd., Regent's Park N.W., Engineer.
1891. Chadwick, Walter M., 24, West 3rd Street, Bayonne, N.J., U.S.A., Chemical Works Manager.
1897. Challen, Matthew B., School of Mines, Daylesford, Victoria, Australia, Assayer.
- O.M. Chaloner, G., 30, Weston Park, Crouch End, N., Chemical Lecturer.
1894. Chaloner, G. W., 26, Eagle Wharf Road, Hoxton, N., Chemical Manager.
1901. Chamberlain, C. E., 5169, Delmar Building, St. Louis, Mo., U.S.A., Chemist.
1902. Champion, Edmund C., 510, South Washington Avenue, Iola, Kansas, U.S.A., Chemist.
- O.M. Chance, A. M., Chemical Works, Oldbury, near Birmingham, Chemical Manufacturer.
- O.M. Chandler, Dr. C. F., Columbia University, West 116th Street, New York City, U.S.A., Professor of Chemistry.
1900. Chandler, Prof. W. H., Lehigh University, South Bethlehem, Pa., U.S.A., Professor of Chemistry.
1893. Chaplin, Dr. Edw. M., Public Analyst's Laboratory, Wakefield, Yorks., Analytical Chemist.
1890. Chapman, Alf. C., 8, Duke Street, Aldgate, E.C., Analytical Chemist.
1903. Chapman, Geo. W., Swift Fertilizer Works, 913, Prudential Building, Atlanta, Ga., U.S.A., Superintendent.
- O.M. Chapman, S., 36, Mark Lane, E.C., Chemical Manufacturer.
1894. Charlier, A. C. J., 6, Talbot Road, South Tottenham, N., General Manager and Chemist.
1902. Charlton, Thos., 2926, Webster Street, San Francisco, Cal., U.S.A., Manufacturing Chemist.
1900. Chase, March F., c/o New Jersey Zinc Co., Palmetton, Pa., U.S.A., Chemist.
1889. Chass, R. L., Arnold Printworks, North Adams, Mass., U.S.A., Printworks Chemist.
1894. Chatard, Dr. T. M., 1716, Rhode Island Avenue, Washington, D.C., U.S.A., Chemical Engineer.
1898. Chattock, Herbert E., 23, Apsley Road, Clifton, Bristol, Oilcake Manufacturer.
1901. Cheetham, Howard, 18, St. Ann Street, Manchester, Chartered Patent Agent.
1905. Cheke, Thos. W., 7, Elm Grove, Stroud Green, London, N., Analytical Chemist.
1894. Cheney, J. P., c/o Cheney Bros., South Manchester, Conn., U.S.A., Silk Manufacturer's Chemist.
1885. Cheyne, A. M., c/o Messrs. Burgoyne, 16, Coleman Street, London, E.C., Analytical Chemist.
1905. Chick, Oliver, 52, High Street, Hornsey, N., Analytical Chemist.
1902. Chilwell, John, Oakeswell, Wednesbury, Analyst.
1893. Cholerton, A. F., 403, Belgrave Gate, Leicester, Manufacturing Chemist.
1890. Chorley, Jno. C., Bewsey, Oxford Road, Birkdale, Lanes., Analytical Chemist.
- O.M. Christie, J., Levenfield, Alexandria, N.B., Dyer and Printer.
1903. Christie, John, c/o The New Explosives Co., Ltd., Stowmarket, Suffolk, Analytical Chemist.
1898. Christison, Geo., Cremona, Cambridge Drive, Glasgow, Engineer.
1883. Christy, Thos., The Manor House, Wallington, Surrey; and 4, 10, and 12, Old Swan Lane, London, E.C., Chemical Botanist.
- O.M. Chrystal, W. J., 7, West George Street, Glasgow, Chemical Manufacturer.
1904. Chubb, H. M., Wharfedale Villas, Tadcaster, Yorks., Brewery Chemist.
- O.M. Church, Professor A. H., F.R.S., Shelsley, Kew, Surrey, Professor of Chemistry in the Royal Academy.
1890. Church, Elihu D., jun., 63, Wall Street, New York City, U.S.A., Soda Manufacturer.
1896. Claflin, Alan, Littleton, Mass., U.S.A., Manufacturing Chemist.
1900. Clamer, Guiliam H., 46, Richmond Street, Philadelphia, Pa., U.S.A., Chemist.
1885. Clanahan, H. C., 79, Mosley Street, Manchester, Chemical Merchant.
1901. Clapham, Henry E., Laurel Bank, Wilsden, near Bradford, Yorks., Technical Chemist.
1891. Clapp, Ralph R., c/o Standard Ammonia Co., Ltd., Iceland Wharf, Old Ford, E., Ammonia Works Manager.
1889. Clapperton, J., jun., Analytical Chemist.
1903. Clare, Henry, 107, Newgate Street, Morpeth, Northumberland, Schoolmaster.
1904. Clark, Arthur W., c/o J. Elwood Lee Co., Conshohocken, Pa., U.S.A., Chemist and Bacteriologist.
1903. Clark, Augustus, Fundicio do Bowman, Caixa 57, Recife, Pernambuco, Brazil, Mechanical Engineer.
1896. Clark, Donald, Bairnsdale, Victoria, Australia, Director of School of Mines.
1903. Clark, Edmund, Room 1007, Appraisers' Stores, 641 Washington Street, New York City, U.S.A., Chemist.
1904. Clark, Ernest, Royal Technical Institute, Salford, Assistant Lecturer in Chemistry.
1904. Clark, Dr. Friend E., Pennsylvania State College, State College, Pa., U.S.A., Chemist.
1904. Clark, Dr. Homer, c/o The Vacuum Varnish and Chemical Co., 6, Seaview Avenue, East Norwalk, Conn., U.S.A., Chemical Manufacturer.
- O.M. Clark, Dr. J., 138, Bath Street, Glasgow, Analytical Chemist.
1900. Clark, Jno., Broadway Works, Millwall Dock, London, E., Manufacturing Chemist.
1902. Clark, Robt. M., Rockbank, Partickhill, Glasgow, Chemist.
1903. Clark, Dr. W. Inglis, 104, South Canongate, Edinburgh, Manufacturing Chemist.

1902. Clark, Wm. Lums, Chemist, Carbon Paper Co., Hamilton, Ohio, U.S.A., Chemist.
1904. Clarke, A. R., 613-617, Euston Avenue, Toronto, Canada, Leather Manufacturer.
1891. Clarke, Goddard, South Lodge, Champion Hill, S.E., Drysalter.
1898. Clarke, J. F. Wyllie, Messrs. J. and R. Tennent, Wellpark Brewery, Glasgow, Managing Director.
1903. Clarke, Robt. W., (Journals) c/o Chemical Research Association, Ltd., 1, Southwark Street, London, S.E., (subs.) 3, Abenden Villas, Chase Road, Southgate, N., Analyst.
1897. Clarke, Wm. B., c/o Edison-Swan U.E.I. Co., Ltd., Ponders End, N., Electric Chemist.
- O.M. Claudet, A. C., 6, Coleman Street, E.C.; and (Journals) 9, Daleham Gardens, Hampstead, N.W., Metallurgist.
- O.M. Claudet, F. G., 181, Willesden Lane, N.W., Assayer and Metallurgist.
1889. Claus, Wm. H., c/o Claus and Ree, Clayton, Manchester, Manufacturing Chemist.
- O.M. Clayton, E. G., Chemical Laboratory, 32, Holborn Viaduct, London, E.C., Consulting Chemist.
1895. Clayton, Dr. G. C., Etonfield, Waverley, Liverpool.
1891. Clayton, J. W., c/o Clayton and Jowett, Ltd., Concert Street, Liverpool, Essence Distiller.
1894. Clayton, Robt. H., Woodleigh, Blackfield Lane, Kersal, Manchester, Chemist.
1893. Clemes, J. H., The Bracken, Newquay, Cornwall.
1886. Clemenishaw, E., Alkali Works, Oldbury, near Birmingham, Technical Chemist.
1883. Clemons, G. H., Cudbear Street, Hunslet Road, Leeds, Dyeware Manufacturer.
1884. Clerk, Dugald, 18, Southampton Buildings, Chancery Lane, W.C., Engineer.
1899. Cleveland, D. B., 116, Olive Street, Cleveland, Ohio, U.S.A., Chemist.
1900. Clifford, Wm., Sewage Outfall Works, Wolverhampton, Sewage Works Manager.
- O.M. Cloud, T. C., 4, Lloyd's Avenue, Fenchurch Street, London, E.C., Metallurgist.
- O.M. Clowes, Dr. F., 40, Craven Street, Charing Cross, W.C.; and the Grange, College Road, Dulwich, S.E., Chief Chemist (I.C.C.).
1891. Clutton, J. H., Elliott's Metal Co., Ltd., Burry Port, R.S.O., Carmarthenshire, Assayer.
1900. Clymer, Wm. R., c/o National Carbon Co., Cleveland, Ohio, U.S.A., Chemist.
1899. Coates, Chas. E., jun., Louisiana State University, Baton Rouge, La., U.S.A., Professor of Chemistry.
1888. Coats, Jno. T., 105, Broughton Street, Edinburgh, Manufacturing Chemist.
1893. Cobb, Jno. W., Farnley Ironworks, near Leeds, Technical Assistant to Managing Director.
1904. Coblenz, Lambert, 1708, Sutter Street, San Francisco, Cal., U.S.A., Chemist.
1894. Coblenz, Dr. Virgil, College of Pharmacy, 115, West 68th Street, New York City, U.S.A., Chemical Lecturer.
1899. Cochran, Alfred, 559, Madison Street, Brooklyn, N.Y., U.S.A., Chemist.
1904. Cochran, C. B., 514, South High Street, West Chester, Pa., U.S.A., Teacher of Chemistry.
1898. Cochrane, A. Lynde, 55, Kilby Street, Boston, Mass., U.S.A., Clerk (Cochrane Chemical Co.).
1901. Cockburn, John A., Ardeer, Stevenston, Ayrshire, Analytical Chemist.
1902. Cocking, Allan T., Carhampton House, Four Oaks, Sutton Coldfield, Ammunition Manufacturer.
1903. Cofman-Nicoresti, J., 41, Hart Street, Bloomsbury, W.C., Chemist.
1903. Coggeshall, Dr. G. W., Chestnut Street, Dedham, Mass., U.S.A., Chemical Manufacturer.
1887. Coghill, P. de G., Borax Works, Old Swan, Liverpool, Technical Chemist.
1884. Cogswell, W. B., Syracuse, N.Y., U.S.A., Chemical Engineer.
- O.M. Cohen, Dr. J., 13, Cardigan Road, Leeds, Analytical Chemist.
1897. Cohn, Alfred J., c/o Merck and Co., 1319, University Place, New York City, U.S.A., Chemist.
1901. Cohn, Samuel, 13, Deane Street, New York City, U.S.A., Metallurgical Chemist.
1904. Cohen, Prof. W. P., M. M. C. University, Toronto, Canada, Professor of Chemistry.
1903. Colbert, W., British S.A. Dynamite Factory, Modderfontein, Transvaal, Analytical Chemist.
1891. Colby, Albert E., c/o International No. 1 Co., 43, Exchange Place, New York City, U.S.A., Metal-forged Engineer.
1899. Colby, E. A., Baker-Platinum Works, Newry, N.I., U.S.A., Metallurgical Chemist.
- O.M. Colby, W. H., Cwrtz-gwen, Aberystwith, Wales.
1893. Coletax, Dr. Arthur, 85, Oaslow Square, London, S.W., Barrister-at Law.
1893. Coleman, W. H., 299, North Road, Clayton, Manchester, Tar Works Chemist.
- O.M. Collins, E., Vinegar Works, Stourport, Worcestershire, Manager.
1887. Collett, J. M., Hillfield, Gloucester, Chemical Manufacturer.
1901. Colley, Bernard T., c/o American Smelting and Refining Co., Aguas Calientes, Mexico, Assayer.
1902. Colley, Hylton H., c/o Dr. Bedford, Ponsorby, Auckland, New Zealand, Chemist.
1903. Collier, Pierre, Companhia Industrial Pernambuco, Pernambuco, Brazil, Civil Engineer.
1893. Collin, Dr. C. A., Ferguslie Threadworks, Paisley, N.B., Textile Chemist.
1898. Collingridge, Frank, 45, Banford Road, Edgbaston, Birmingham, Chemist.
1883. Collins, J. B., Crinnis, Par Station, Cornwall, Technical Chemist.
1899. Collins, S. Hoare, Armstrong College, Newcastle-on-Tyne, Agricultural Chemist.
1888. Collins, W., Hepworth, Analytical Chemist.
1899. Collis, Walter T., Swinford House, Stourbridge, Worcestershire, Chemist.
1891. Colman, Dr. H. G., Elmside, Worcester Park, Surrey, Analytical Chemist.
1892. Colquhoun, Lewis, c/o South African Explosives Co., Modderfontein, Transvaal, Analytical Chemist.
1894. Colquhoun, W., Plas Penyddol, Bersham, near Wrexham, North Wales, Engineer.
1901. Colwell, J. Kear, Finsbury Town Hall, Roschery Avenue, E.C., Analytical and Consulting Chemist.
1900. Coney, Arthur M., 12, Pearl Street, Boston, Mass., U.S.A., Technical Chemist.
1899. Conant, Francis M., c/o Sanderson and Porter, Mishawaka, Ind., U.S.A., Chemical Engineer.
1901. Connah, Jas., 31, Rudall Crescent, Hampstead, N.W., Government Analyst.
1905. Conner, Arthur B., 1070 Fort St. West, Detroit, Mich., U.S.A., Chemist.
1902. Conner, Robt. S., c/o Newaygo Portland Cement Co., Newaygo, Mich., U.S.A., Chemist.
1883. Connor, C. C., 4, Queen's Elms, Belfast, Ireland, Chemist.
1891. Conradson, Pontus H., Galena Oil Works, Franklin, Pa., U.S.A., Analytical Chemist.
1889. Conroy, Dr. Jas. T., 13, Howard Drive, Grassendale, Liverpool, Chemist.
1887. Constable, W. H., (Journals) Australian Alum Works, Runcorn; and (communications) Riversdale, Dee Banks, Chester, Analytical Chemist.
1902. Converse, W. A., Rooms 27-34, Rialto Building, Chicago, Ill., U.S.A., Chemist.
1891. Coode, J. Charles, 19, Freeland Road, Ealing, W., Civil Engineer.
- O.M. Cook, H. J., The Firs, Woodford Green, Essex, Soap Manufacturer.
1903. Cook, Jas. W., London and Provincial Dye Works, Hackney Wick, N.E., Dyer.
1888. Cook, Jno. J., Atlas Foundry, St. Helens, Lancashire, Ironfounder.
1899. Cook, R. Anderson, New Brunswick, N.J., U.S.A., Chemist.
1898. Cook, Thos. Alex., East London Soap Works, Bow, E., Soapmaker.

1899. Cook, Walter G., 9, Hendon Lane, Finchley, N., Analytical Chemist.
1891. Cooke, Arthur W., c/o Brotherton and Co., Ltd., Holmes Street, Dewsbury Road, Leeds, Analytical Chemist.
1904. Cooke, W. Tennent, 84, Elliscombe Road, Charlton, S.E., Research Student.
1901. Cooper, T. S., Beckfoot, Manchester, S.E., Calico Printing Chemist.
1891. Cooper, Walter J., (communications) c/o South Wales Cement Co., Penarth, Cardiff; and (Journals) The Elms, Lower Penarth, South Wales, Cement Works Manager.
1897. Cooper, Wm. R., 113, Tulse Hill, S.W., Electrical Engineer.
1890. Corcoran, Bryan, Chestnuts, Sutton, Surrey, Chemical Engineer.
1887. Corder-James, J. H., Finsbury House, Blomfield Street, London, E.C., Mining Engineer.
1905. Cormack, Wm., c/o G. Nelson, Dale and Co., Ltd., Emscote Mills, Warwick, Chemist.
1899. Cornelison, Dr. Robt. W., Bloomfield, N.J., U.S.A., Consulting Chemist.
1887. Cornett, Jas. P., Ford Paper Works, Hylton, near Sunderland, Paper Maker.
1903. Corrêa de Brito, Dr. L., Rua do Commercio, 6, Recife, Pernambuco, Brazil, Civil Engineer.
1889. Corrie, David, c/o Nobel's Explosives Co., Ltd., Polmont Station, N.B., Technical Chemist.
1902. Corse, Wm. Malcom, 1283, Third Avenue, Detroit, Mich., U.S.A., Chemist.
1903. Cortright, R. M., 20, South Centre Street, Bethlehem, Pa., U.S.A., Assistant Chemist.
1894. Coste, J. H., 40, Craven Street, W.C., and (Journals) 206, Amburst Road, Hackney, E., Analytical Chemist.
1904. Costobadie, H. A., Overdale, Mottram-in-Longden- dale, near Manchester, Calico Printer.
1891. Cotton, W. F., Hollywood Roebuck, Co. Dublin, Gas Works Manager.
1905. Cotton, Wm. H., The Schlüsselburg Calico Printing Co., Schlüsselburg, near St. Petersburg, Russia, Chemist.
1904. Coubrough, Col. John, Blenheim, Stirlingshire.
1898. Coupe-Annable, H. W., c/o Tungsten and Rare Metals Co., Queen's Road, Battersea, S.W., Chemist.
1894. Court, Heywood, 67, Surrey Street, Sheffield, Analytical Chemist.
1898. Courtney, Samuel, 37, The Mount, Belfast, Ireland, Manager.
1894. Cousins, W. J., 17, Temple Chambers, Temple Avenue, E.C., Consulting Chemist and Director.
1903. Cowan, Wallace, c/o The Stirling Boiler Co., Ltd., Motherwell, N.B., Analytical Chemist.
1893. Cowan, W. J., 12, Park Avenue, Wood Green, N., Fine Colour Manufacturer.
1897. Cowburn, Arthur W., 29, Princess Street, Man- chester, Chemical Merchant and Analytical Chemist.
1894. Cowburn, W. H., 29, Princess Street, Manchester, Chemical Merchant.
1904. Cowie, Harvey D., 161, River Street, Troy, N.Y., U.S.A., Chemist.
1905. Cowles, Horace W., jun., Box 225, Hinsdale, Du Page Co., Ill., U.S.A., Assistant Chemist.
1891. Cownley, A. J., 225, Barry Road, Dulwich, S.E., Analytical Chemist.
1891. Cowper-Coles, Sherard Osborn, Grosvenor Mansions, Victoria Street, Westminster, S.W., Metallurgical Engineer.
1902. Coyle, Berj. C., City Laboratory, 17, Castle Street, Dublin, Analytical Chemist.
1904. Coysb, Basil R., 23, Woodville Gardens, Ealing, W., Manufacturing Chemist.
1884. Craig, Geo., Chemical Laboratory, 95, Bath Street, Glasgow, Technical Chemist.
1895. Craig, Thos. J., 21, Dunard Road, Rutherglen, N.B., Chemist.
1903. Crane, Chas. R., 42, Pooley Place, Buffalo, N.Y., U.S.A., Chemist.
1904. Cramer, A., jun., Cramer and King Co., Paterson, N.J., U.S.A., Chemist.
1901. Crane, Fred. D., 28, Hillside Avenue, Montclair, N.J., U.S.A., Consulting Chemist.
1902. Crane, Jasper E., c/o The Arlington Co., Arlington, N.J., U.S.A., Chemist.
1898. Cranfield, Wm., Higher Grade Board School, Halifax, Yorks, Teacher of Chemistry.
1903. Cranmer, Ridgeway, 170, 88th Street, Bay Ridge, Brooklyn, N.Y., U.S.A., Chemist.
1902. Craven, Alfd. B., 91, Fielding Terrace, Armley, Leeds, Analytical Chemist.
1889. Craven, Chas. E., Oak Villa, Bramley, near Leeds, Dyer.
1899. Craven, Jas. c/o Columbia Creosoting Co., Shirley, Ind., U.S.A., Chemist.
1891. Craven, Jno., jnn., c/o Dominion Tar and Chemical Co., Ltd., Sydney, C.B., Canada, Chemist.
1885. Craw, John, 15, Cadogan Street, Glasgow, Drysalter.
- O.M. Crawford, D., Langdale's Chemical Manure Co., Ltd., St. Lawrence, Newcastle-on-Tyne, Manager.
1884. Crawford, D., 12, Abbey Grove, Eccles, Manchester, Dyer and Printer.
1890. Crawshaw, E., 25, Tollington Park, London, N., Dye Merchant.
1900. Crayen, Dr. Gustav, 354, West 23rd Street, New York City, U.S.A.
- O.M. Cresswell, C. G., Ermyngarth, Ashted, Surrey; and 9, Bridge Street, Westminster, S.W., Chemist.
1901. Cribb, Cecil, 136, Shafteshury Avenue, London, W., Analytical and Consulting Chemist.
1905. Crighton, W. H., 33, Ardleigh Road, Southgate Road, London, N., Chemist.
1890. Crier, Wm. R., c/o Messrs. D. Weldie and Co., Konnagar, near Calcutta, India, Manufacturing Chemist.
1902. Cripps, R. A., Laboratory, D'Avigdor Road, Hove, Sussex, Analyst.
1902. Croasdale, Dr. Stuart, 1574, York Street, Denver, Colo., U.S.A., Mining Engineer and Metallurgist.
1885. Crompton, Percy R., Elton Paper Mills, near Bury, Lancashire, Paper Maker.
1901. Cronquist, G. W., Hyllinge, Bjuf, Sweden, Fire Brick Works Manager.
1889. Cronquist, Prof. A. Werner, 4, Kammakaregatan, Stockholm, Sweden, Consulting Chemist.
- O.M. Crookes, Sir Wm., F.R.S., 7, Kensington Park Gardens, Notting Hill, W., Analytical Chemist.
1896. Crosby, Thos., Llanelly Steelworks, Llanelly, South Wales, Metallurgist.
- O.M. Crosfield, A. L., 46, Bidston Road, Oxtou, Birken- head, Analytical Chemist and Assayer.
1896. Crosfield, Capt. G. R., Volunteer Quarters, Sankey Street, Warrington, Soap Manufacturer.
1905. Crosley, W., Hall Mines Smelting Co., Ltd., Nelson, B.C., Canada, Chemist.
1884. Cross, C. F., 4, New Court, Lincoln's Inn, London, W.C., Analytical Chemist.
1894. Crossley, Prof. Arthur W., Pharmaceutical Society, 17, Bloomsbury Square, London, W.C., Professor of Chemistry.
1900. Crossley, Frank, Duchy Bank, Seedley Road, Pendleton, Manchester, Analytical Chemist.
1904. Crossley, T. Linsey, Hawkesbury, Ont., Canada, Analytical Chemist.
1902. Crossley-Holland, F. W., 68, Parade, Leamington, Chemist and Druggist.
1892. Crossman, Tom, Albion Brewery, Coldhurst Street, Oldham, Brewing Chemist.
1894. Crow, Henry W., 94, Romford Road, Stratford, E., Tar Distiller.
1884. Crow, Dr. J. K., 2, Ulundi Road, Blackheath, S.E., Technical Chemist.
1902. Crowell, Henry H., c/o Jos. Bancroft and Sons Co., Wilmington, Del., U.S.A., Dyer.
1893. Crowther, Edw., Woodland Dyeworks, Headingley, Leeds, Dyer.
1883. Crowther, Horace W., The Beeches, West Bromwich, Technical Chemist.

1899. Crowther, J., South Australian School of Mines; and (Journals) Weedna Villa, Mand Street, Unley, Adelaide, South Australia, Metallurgist.
1884. Crowther, W. M., Field House, Gomersal, near Leeds, Manufacturing Chemist.
1884. Crumble, W. D., 116, Washington Street, East Orange, N.J., U.S.A., Analytical Chemist.
1902. Crush, E. H., 225, Westcombe Hill, Blackheath, S.E., Technical Chemist.
1903. Cullen, W. H., The Castner-Kellner Alkali Co., Ltd., Weston Point, near Runcorn, Cheshire, Engineer.
1892. Cullen, Wm., Dynamite Factory, Modderfontein, Transvaal, Chemist.
1897. Culmann, Dr. Julius, 525, Norwood Avenue, Buffalo, N.Y., U.S.A., Chemist and Colourist.
1904. Culmer, Harry H., 6200, Madison Avenue, Chicago, Ill., U.S.A., Chemist and Tar Distiller.
1883. Cuming, James, jun., Chemical Works, Yarraville, Melbourne, Australia, Chemical and Fertiliser Manufacturer.
1897. Cunliffe, Albert J., Claytonfield, Clayton-le-Woods, Chorley, Lancashire, Calico Printer.
1893. Cunningham, Edw., c/o S. Cabot, 141, Milk Street, Boston, Mass., U.S.A., Chemical Engineer.
- O.M. Curphey, W. S., Borya, Lenzie, N.B., Alkali Works Inspector.
1902. Currier, Edw. Eng., 15, Ferry Street, Everett, Mass., U.S.A., Chemist.
1898. Curtis, Marvin, 123, California Street, San Francisco, Cal., U.S.A., Wine Chemist.
1903. Cushing, Robt. P., Lock Haven, Pa., U.S.A., Chemist.
1902. Cutbush, Chas. G., 149, Westcombe Hill, Blackheath, S.E., Electrical Engineer.
1890. Cutler, Fred. F., 183, Essex Street, Boston, Mass., U.S.A., Publisher.
1904. Cutts, Henry E., 55, Fulton Street, New York City, U.S.A., Technical Chemist.
1891. Davidson, Richard, 11, High Street, Dundee, Oil Merchant's Clerk.
- O.M. Davidson, R. Holden, c/o United Alkali Co., Ltd., Ammonia Soda Works, Fleetwood, Manager.
1904. Davidson, Robert, c/o Edgely and Co., Ltd., 15, Bent Street, Sydney, N.S.W., Australia.
1905. Davidson, Thos. A., c/o Joe. Watson and Sons, Ltd., Leeds; and (Journals) 20, Cromer Terrace, Leeds, Chemist (Glycerin Distillery).
1897. Davies, Charles T., 207, Windsor Street, Reading, Pa., U.S.A., Chemist.
1889. Davies, G. W., 8, Spring Hill, Stockport, Chemical Lecturer.
1898. Davies, Herbert E., The Laboratory, 28, Chapel Street, Liverpool, Analytical Chemist.
1898. Davies, Laysdon, 1, North Claremont Gardens, Glasgow, Gunpowder Mills Manager.
1896. Davies, Llewellyn J., Bute Chambers, Bute Road, Cardiff, Analytical and Consulting Chemist.
1886. Davies, M. Lloyd, North American Chemical Co., Bay City, Mich., U.S.A., Alkali Works Manager.
1897. Davies, Saml. H., c/o Rowntree and Co., Ltd., Cocoa Works, York, Research Chemist.
1903. Davies, Thomas, 56, Wellesley Street, Toronto, Ont., Canada, Manufacturer.
1902. Davies, Wm. Rhys, 60, Northampton Terrace, Bradford, Yorks, Analytical Chemist.
1900. Davis, Arthur C., 2, Downing Grove, Cambridge, Cement Maker.
- O.M. Davis, A. R., Haydock Villa, Wellington Road North, Stockport, Analytical Chemist.
1901. Davis, Bernard F., c/o Borneo Co., Baedak, Sambas, Borneo, Metallurgical Engineer.
1902. Davis, Charles B., S.W., Corner of 23rd Street and 9th Avenue, New York City, U.S.A., Technical Chemist.
1902. Davis, Emerson, 515, Cass Avenue, Detroit, Mich., U.S.A., Chemist.
1893. Davis, Fred., 51, Imperial Buildings, Ludgate Circus, London, E.C., Consulting Chemist.
- O.M. Davis, George E., 265, Strand, London, W.C., Chemical Engineer.
- O.M. Davis, H. W., Government Laboratory, Clement's Inn Passage, Strand, W.C., Analytical Chemist.
1903. Davis, Leon K., Room 510, 31, Milk Street, Boston, Mass., U.S.A., Chemical Engineer.
- O.M. Davis, T. Sebastian, 199, South Lambeth Road, London, S.E., Vinegar Works Chemist.
1897. Davis, Wm. A., 8, Quenington Mansions, Rostrevor Road, Fulham, S.W., Chemist.
1900. Daw, Fred W., Alexander Place, Ebbw Vale, Mon., Metallurgical Chemist.
1903. Daves, Arthur W., 3, Madison Place, Albany, N.Y., U.S.A., Chemist.
- O.M. Dawson, C. A., 40, Russell Road, Sefton Park, Liverpool, Technical Chemist.
1886. Dawson, W. Haywood, British Alizarin Co., Ltd., Silvertown, E., and (Journals) 187, Eglinton Road, Woolwich, S.E., Technical Chemist.
1901. Day, Dr. David T., U.S. Geological Survey, Washington, D.C., U.S.A., Geologist.
- O.M. Deacon, H. W., 8, Ullet Road, Liverpool, Alkali Manufacturer.
- O.M. Deakin, H. T., Dewhurst House, Egerton, near Bolton, Dyer.
1903. Deane, Harry, 23, Spinkfield Road, Birkby, Huddersfield, Chemist.
1899. Deane, Leopold M., Davington House, Faversham, Kent, Chemist (Cotton Powder Co., Ltd.).
1892. Deaville, B., Beech Avenue, Nottingham, Manufacturing Chemist.
1903. De Blois, W. H., c/o Pulaski Mining Co., Pulaski, Va., U.S.A., Chemist.
1899. De Castro, J. Paul, Laboratory, Eppingham House, Arundel Street, Strand, W.C., Consulting Chemist and Assayer.
1902. De Cew, J. A., c/o Canada Paper Mills, Windsor Mills, Quebec, Canada, Chemist.
1893. De Clerck, Maurice, Heule-lez-Courtrai, Belgium.
1884. Deering, W. H., Chemical Department, Royal Arsenal, Woolwich, S.E., Analytical Chemist.

D

- O.M. Dacie, J. C., Soap Works, Putney, S.W., Soap Manufacturer.
1897. Dains, Herbert H., 27, Inderwick Road, Stroud Green, N., Analytical Chemist.
1904. Dale, G., Waverley Terrace, Hood Lane, Warrington, Technical Chemist.
1884. Daniell, Louis C., (Journals) Royal Standard Brewery, Tamworth, New South Wales; and (subs.) c/o W. T. Allen and Co., 132, Queen Victoria Street, London, E.C., Brewer.
1904. Danker, Dan. J., 247, Atlantic Avenue, Boston, Mass., U.S.A., Dyestuff and Chemical Manufacturer.
1903. Dannenbaum, Dr. H., 3346, Frankland Avenue, Philadelphia, Pa., U.S.A., Secretary and Treasurer (National Ammonia Co.).
1902. Danziger, Jos. L., 302, West 114th Street, New York City, U.S.A., Analytical Chemist.
1885. Darby, Jno. H., Brymbo Hall, near Wrexham, Ironmaster.
1894. Darling, G. A., c/o Lisbon Berlyn, Ltd., Frankfort, Pilgrim's Rest, Transvaal, S.A., Metallurgical Chemist.
- O.M. Darling, W. H., 26, Dover Street, Manchester, Analytical Chemist.
1887. Davenport, Dr. B. F., 161, Tremont Street, Boston, Mass., U.S.A., Consulting Chemist.
1900. Davidson, Alex., jun., 2, Hamilton Park Terrace, Hillhead, Glasgow, Analytical Chemist.
1899. Davidson, Charles, 37, Heriot Street, Pollokshields, Glasgow, Analytical Chemist.
1901. Davidson, G. M., Chicago and N.W. Railroad Shops, P.O. Station E., Chicago, Ill., U.S.A., Chemist.
1883. Davidson, J. E., 40, Percy Gardens, Tynemouth, Chemical Manufacturer.

1900. Deerr, Noel, Blairmont, Berbice, British Guiana, Analytical Chemist.
1902. Deghuccé, Dr. Jos. A., 247, Harrison Street, Brooklyn, N.Y., U.S.A., Chemist.
1901. De Jonge, Cornelius, 36, Doughty Street, Brooklyn, N.Y., U.S.A., Pharmaceutical Chemist.
1893. Delahaye, Philibert, 105, Rue St. Lazare, Paris (IX.), Gas Engineer.
1901. Delany, Chas., c/o Elliott Bros., Ltd., O'Connell Street, Sydney, N.S.W., Australia, Chemist.
1888. Dempsey, Geo. C., 165, Market Street, Lowell, Mass., U.S.A., Chemist.
1904. Dempwolf, Chas., jun., 713, South George Street, York, Pa., U.S.A., Chemical Manufacturer.
1899. Denham, Wm. S., 2, Kelvinside Terrace North, Glasgow, Chemist.
1891. Denison, Joseph R., 18, Duckworth Lane, Bradford, Yorks., Analytical Chemist.
1898. Dent, Dr. Frankland, 3, Claremont Drive, Headingley, Leeds, Consulting Chemist.
1901. Devas, Dr. Ernest W., 74, Woodland Terrace, Old Charlton, Kent, Technical Chemist.
1890. De Velling, F. W., Higher Grade Board School, The Boulevard, Hull, Head Master and Science Lecturer.
1898. Dewar, Alex. H., c/o The Linoleum Manufacturing Co., Staines, Middlesex, Chemist.
- O.M. Dewar, Sir J., F.R.S., Royal Institution, Albemarle Street, W. (Journals); and J. Seroupe Terrace, Cambridge, Professor of Chemistry and Physics.
1889. Dewey, Fred. P., Lanier Heights, Washington, D.C., U.S.A., Metallurgist.
1899. Dewez, Eugène, jun., Herve, Belgium, Tanner.
1904. Dewhurst, J. A., 36, Southfield Square, Bradford, Yorks., Analyst.
1891. De Wilde, Prof. P., 1, Quai du Léman, Geneva, Switzerland, Professor of Chemistry.
1903. Diamond, Wm., c/o Simon-Carves, Ltd., Barrow Collieries, near Barnsley, Yorks., Works Manager.
- O.M. Dibdin, W. J., Edinburgh Mansions, Howick Place, S.W.; and (Journals) Mayfield, Grange Road, Sutton, Surrey, Analytical Chemist.
1897. Dick, Jno., c/o Jno. Dick, Ltd., 77, York Street, Toronto, Ont., Canada, Manufacturer.
1902. Dick, Jno., Wharf Road, Cubitt Town, London, E., Manager and Chemist.
1904. Dick, W. D., 46, Primrose Hill Road, South Hampstead, N.W., Analytical Chemist.
1898. Dickenson, Frank, 26, O'Connell Avenue, Berkeley Road, Dublin.
1896. Dickenson, F. M., c/o Broken Hill Proprietary Co., 3, Great Winchester Street, E.C., Secretary.
1904. Dickenson-Gair, C. J., 11, St. Luke's Road, Clapham, S.W., Analytical Chemist.
1902. Dieckman, Jndson C., 10, Minot Street, Woburn, Mass., U.S.A., Chemical Engineer.
1893. Dickerson, E. N., 141, Broadway, New York City, U.S.A., Lawyer.
- O.M. Dickinson, A. J., Neptune Tar and Chemical Works, Deptford, S.E.; and (Journals) 57, Lewisham High Road, S.E., Tar Distiller.
1905. Dickinson, Cyril, Abbotsford, Hollycroft Avenue, Hampstead, N.W., Analytical Chemist.
1887. Dickson, Jno., Easter Fluchter, Baldernock, near Glasgow.
1898. Dickson, Samuel, 2, Broadway, Westminster, S.W., Analytical Chemist.
1899. Dieckmann, Dr. Otto, 1182, Harrison Avenue, Cincinnati, Ohio, U.S.A., Chemist.
1901. Diehl, Oscar C., c/o Saginaw Salt Co., St. Charles, Mich., U.S.A., Chemist.
1894. Diestel, Wm., 77, William Street, New York City, U.S.A., Dyestuff Importer.
1898. Dillon, Wm., 28, Oakwood Avenue, Roundhay, Leeds, Oil, Colour, and Varnish Manufacturer.
- O.M. Divers, Dr. E., F.R.S., 3, Canning Place, Palace Gate, London, W., Professor of Chemistry.
1903. Divine, Robt. E., Hamburg, Erie Co., N.Y., U.S.A., Chemist.
1899. Dixon, Fred. W., 11, Clarendon Avenue, Newtonville, Mass., U.S.A., Dyer.
1888. Dixon, Prof. Harold B., F.R.S., Owens College, Manchester, Professor of Chemistry.
1885. Dixon, Jos., Spring Grove, near Sheffield, Paper Maker.
1884. Dixon, Wm., 102, Spring Street, Bury, Lancashire, Science Master.
1902. Dixon, Wm. A., 97, Pitt Street, Sydney, N.S.W., Australia, Public Analyst and Assayer.
1892. Dobb, Thos., 54, Riverdale Road, Sheffield, Pharmaceutical Chemist.
- O.M. Dobbie, Dr. J. J., Royal Scottish Museum, Chambers Street, Edinburgh, Director.
1901. Dobbie, Jas., Laurel Bank, Broomfield Road, Ayr, N.B., Tanner.
- O.M. Dobbins, Dr. L., Chemical Laboratory, University, Edinburgh, Professor of Chemistry.
1890. Dodd, A. J., Heathfield House, Belvedere, Kent, Works Manager.
1889. Dodd, W. Ralph, Trederwen, Village Road, Enfield, Middlesex, Chemical Works Manager.
1901. Dodds, Roger, Bigod's Hall, Dunmow, Essex, Technical Chemist.
1900. Dodge, Dr. Francis D., 69, Avenue A., Bayonne, N.J., U.S.A., Chemist.
1897. Doerflinger, Wm. F., c/o Acker Process Co., Niagara Falls, N.Y., U.S.A., Research Chemist.
1897. Dohme, Dr. Alf. R. L., Messrs. Sharp and Dohme, Baltimore, Md., U.S.A., Manufacturing Chemist.
1885. Doidge, H., Mountain Rise, Maritzburg, Natal.
1903. Dole, Richard B., State Bacteriological Laboratory, Minneapolis, Minn., U.S.A., Chemist.
1897. Dolge, Carl B., Westport, Conn., U.S.A., Manufacturer of Instruments and Antiseptics.
1884. Donald, Jas., 96, Anerley Park, Anerley, S.E., Manufacturing Chemist.
1903. Donald, Dr. Jas. T., 112, St. Francois Xavier Street, Montreal, Canada, Consulting Chemist.
- O.M. Donald, W., Saltecoats, N.B., Analytical Chemist.
1900. Donald, Wm., Ridgefield Park, Bergen Co., N.J., U.S.A., Assayer and Chemist.
1902. Donaldson, Thos., c/o South African Explosives Co., Ltd., Modderfontein, Transvaal, Chemist.
1901. Donnelly, Francis, 335, Hyde Road, Ardwick, Manchester, Manager (Varnish Co.).
1886. Doolittle, Orrin S., 445, Oley Street, Reading, Pa., U.S.A., Chemist.
1890. Dore, Jas., Copper Works, High Street, Bromley-by-Bow, E., Distiller's Engineer.
1896. Doremus, Dr. Chas. A., 59, West 51st Street, New York City, U.S.A., Professor of Chemistry.
- O.M. Dott, D. B., Abbey Hill Chemical Works, Edinburgh, Analytical Chemist.
1883. Dougall, Archibald, Gasworks, Kidderminster, Gas Engineer.
1897. Douglas, Geo., Heather Bank, Bingley, Yorks., Dyer.
1894. Douglas, Loudon M., Baltic Wharf, Putney, S.W., Chemical Manufacturer.
1884. Douglas, William, Diamond Plantation, Demerara, British Guiana, Chemical Engineer.
1900. Doulton, H. Lewis, Lambeth Pottery, London, S.E., Potter.
1902. Doveton, Godfrey D., 319, Majestic Building, Denver, Colo., U.S.A., Metallurgist.
1900. Dow, Allan W., 2016, Hillyer Place, Washington, D.C., U.S.A., Chemist (District Engineer's Dept.).
1898. Dow, Herbert H., Midland, Mich., U.S.A., Manufacturing Chemist.
1905. Dowbiggin, James, Pentland Cottage, Lancaster, Chemist.
1885. Dowson, J. Emerson, 39, Victoria Street, Westminster, S.W., Civil Engineer.
1901. Doxrud, Christian, Christiania, Norway, Professor of Chemical Technology.
1902. Drake, Bryant S., 1121, 5th Avenue, East Oakland, Cal., U.S.A., Chemist.
1885. Drake, Chas. A., Three Mills Distillery, Bromley-by-Bow, E., Brewer.
1886. Dreaper, W. P., 38, Sydney Road, Beckenham, Kent, Technical Chemist.
- O.M. Drew, D., Lower House Print Works, near Burnley, Calico Printer.

1896. Drewsen, Dr. Viggo B., 5, Beckman Street, New York City, U.S.A., Wood Pulp and Paper Expert.
- O.M. Dreyfus, Dr. C., Clayton Aniline Co., Ltd., Clayton, Manchester, Dye Manufacturer.
1904. Dreyfus, Dr. L. A., c/o The Muralo Co., New Brighton, S.I., N.Y., U.S.A., Chemist.
1893. Dreyfus, S., 1, Sunnyside Terrace, North Road, Clayton, Manchester, Chemist.
1899. Dreyfus, Dr. Wm., 162, East 95th Street, New York City, U.S.A., Chemist.
1899. Drobegg, G., 81, Maiden Lane, New York City, U.S.A., Superintending Chemist.
1889. Drummond, Hon. Sir George, K.C.M.G., Montreal, Canada.
1898. Drummond, Dr. Isaac W., 436, West 22nd Street, New York City, U.S.A., Chemist.
1904. Dubois, Norman A., 495, Euclid Avenue, Syracuse, and (Journals) Hayenmeyer Chemical Laboratory, New York University, N.Y., U.S.A., Instructor in Chemistry.
1903. Dubeque, Edwin D., 310, Reddy Building, Elmira, N.Y., U.S.A., Chemist.
1899. Duens, B. P., 151, Front Street, New York City, U.S.A., Chemical and Dyestuff Importer.
1897. Duckham, Alex., Phoenix Wharf, West Ferry Road, Millwall, E., Works Chemist.
1902. Duckworth, Wm. H., Moorfield, Sylvan Avenue, Sale, Cheshire, Manufacturing Chemist.
1899. Dudderidge, Frank R., 55, Northumberland Street, Newcastle-on-Tyne, Teacher of Chemistry.
1890. Dudley, Dr. C. B., 1219, 12th Avenue, Altoona, Pa., U.S.A., Analytical Chemist.
1887. Dudley, Prof. W. L., Vanderbilt University, Nashville, Tenn., U.S.A., Professor of Chemistry.
1899. Duff, Wm. S., Sebert Villa, Bushwood, Laytonstone, Essex, Manufacturing Chemist.
1901. Duffy, Lawrence, 23, Broomhill Place, Sheffield, Analytical Chemist.
- O.M. Duggan, T. R., 60, Foyle Road, Blackheath, S.E., Analytical Chemist.
1898. Duisberg, Dr. Carl, The Bayer Co., Ltd., (Journals) Elberfeld, Germany; (subscriptions) 19, St. Dunstan's Hill, E.C., Chemist.
1888. Dukes, T. William, Box 10, Vryheid, South Africa, Merchant.
1889. Duncan, Arthur W., 1, Trafalgar Road, Higher Bentcliffe, Pendleton, Manchester, Analytical Chemist.
- O.M. Duncan, Jas., 52, Shakespeare Street, Hove, Sussex; and (Journals) Hotel Bristol, San Remo, Italy, Sugar Refiner.
1904. Duncan, R. A., P.O. Box, 509, Honolulu, Hawaii, Chemist.
1904. Duncan, Wm. Wheeler, 406, Massachusetts Avenue, Boston, Mass., U.S.A., Chemist.
1898. Dunham, Edw. K., 338, East 26th Street, New York City, U.S.A., Professor of Bacteriology and Hygiene.
1901. Dunham, Henry V., c/o Casein Co. of America, Bellows Falls, Vermont, U.S.A., Chemist.
1905. Dunlop, Harry, Craigdarroch, Cove, Dumbartonshire, Chemist.
1889. Dunlop, Robt., 5, Morrison Terrace, North Road, Bellshill, N.B., Oil Works Manager.
1892. Dunn, Fred., 193, Collins Street, Melbourne, Victoria, Analytical Chemist.
- O.M. Dunn, Dr. J. T., 10, Dean Street, Newcastle-on-Tyne, Consulting Chemist.
- O.M. Dunn, P., Northern Assurance Buildings, Albert Square, Manchester, Chemical Merchant.
1902. Dunning, D. M., jun., Auburn, N.Y., U.S.A., Gas Engineer.
1901. Dunsford, Geo., Laboratory, Wigan Coal and Iron Co., Ltd., Wigan, Analytical Chemist.
- O.M. Dupré, Dr. A., F.R.S., Edinburgh Mansions, Howick Place, S.W., Consulting Chemist.
1905. Durand, Halsey, Dept. of Health, 55th Street and 6th Avenue, New York City, U.S.A., Chemist.
1897. Durant, H. T., P. O. Box 603, Bulawayo, Matabeleland, South Africa, Metallurgist.
1897. Durkee, Frank W., Tufts College, Mass., U.S.A., Assistant Professor of Chemistry.
1899. Duvea, Chester B., 89, Madison Avenue, New York City, U.S.A., Starch Manufacturer.
1894. Dyckowitch, Dr. P., 26, Bevis Marks, London, E.C., Technical Chemist.
1903. Dyck, George E., c/o Morriand Co., South Saint Joseph, Mo., U.S.A., Analytical Chemist.
- O.M. Dyer, Dr. B., 17, Great Tower Street, London, E.C., Analytical and Consulting Chemist.
- O.M. Dyson, C. E., Flint, North Wales.
1902. Dyson, George W., 89, Cowlishaw Road, Sheffield, Analyst.
1892. Dyson, Septimus, 8, Belmont Avenue, Haringey, Manufacturing Chemist.

E

1905. Eager, Nassau B., Toronto, Ont., Canada, Barrister.
1904. Eames, Charles J., 99, Water Street, New York City, U.S.A., Consulting Chemist.
1899. Earnshaw, Edward H., 22nd and Fifth Streets, Philadelphia, Pa., U.S.A., Chemist (Gas Improvement Co.).
1902. Earp, Dr. Francis S., 72, Addis Street, Kildgoorie, West Australia, Metallurgical Chemist.
- O.M. Earp, W. R., c/o Rowland A. Earp, Buckfastleigh, Devon, Chemical Manufacturer.
1902. Easterbrooks, Frank D., Raritan Copper Works, Perth Amboy, N.J., U.S.A., Chemist.
1884. Eastick, C. E., 7, King Edward Street, Whitechapel, E., Sugar Works Manager.
- O.M. Eastick, J. J., Milliquin Refinery, Bundaberg, Queensland, Sugar Works Manager.
1890. Eastlake, A. W., Greenwood House, Grove Road, Clapham Park, S.W., Petroleum Works Manager.
1891. Eastwick, Jos. H., 2216, North 51st Street, Philadelphia, Pa., U.S.A., Chemist.
1885. Eastwood, Edw., 7, Bolton Road, Port Sunlight, Birkenhead, Soapmaker.
1902. Eastwood, Robert F., 128, Derby Road, Widnes, Chemist.
1903. Eaton, Edward N., 1628-315, Dearborn Street, Chicago, Ill., U.S.A., Chemist.
1898. Eavenson, Alban, 2013, Vine Street, Philadelphia, Pa., U.S.A., Soap Works Chemist.
1902. Eckel, Edwin Clarence, U.S. Geological Survey, Washington, D.C., U.S.A., Geologist.
1892. Eddy, Harrison P., Sewage Purification Works, Worcester, Mass., U.S.A., Superintendent.
1901. Eddy, W. Clifton, Owosso, Mich., U.S.A., Superintendent.
1894. Ede, Henry E., c/o Copiaque Copper Sulphate Co., Ltd., (Journals) Iquique, Chile; (subscriptions) 101, Leadenhall Street, London, E.C., Chemist.
1885. Edge, Anthony, 79, Milton Street, Readville, Mass., U.S.A., Chemist.
1900. Edgerley, Daniel W., Chilton Paint Co., 69, Cartland Street, New York City, U.S.A., Chemist.
1902. Edison, Thos. Alva, Edison Laboratory, Orange, N.J., U.S.A., Inventor and Manufacturer.
1902. Edwards, H. Seson, 19, Park Road, Port Sunlight, Cheshire, Analyst.
1903. Edwards, R. S., Rockland-Rockport Line Co., Rockland, Maine, U.S.A., Chemist.
1885. Ehrenfeld, Prof. Chas. H., York Collegiate Institute, York, Pa., U.S.A., Professor of Chemistry.
1896. Ehrhardt, Ernest F., Badische Anilin und Soda Fabrik, Ludwigshafen a Rhein, Germany, Research Chemist.
1895. Ekenberg, Dr. M., Stockholm, Sweden, Technical Chemist.
1885. Elborough, T., 59, Mark Lane, London, E.C., Manure Manufacturer.
1901. Elkan, Leo A., 594, Dearborne Avenue, Chicago, Ill., U.S.A., Tanner.
1901. Elkins, Arthur W., 520, Park Avenue, East Orange, N.J., U.S.A., Civil Engineer.

1884. Elliott, Dr. A. H., Consolidated Gas Co., 4, Irving Place, New York City, U.S.A., Chemist.
1896. Elliott, Dr. J. F., c/o Grimwade and Co., 6, Trinity Square, E.C.; and (Journals), O'Connell Street, Sydney, N.S.W., Manufacturing Chemist.
1904. Elliott, Philip, c/o Lanosap, Ltd., Marion Street Works, Bradford, Yorks, Works Chemist.
1902. Elliott, Victor G., Chemical Works, Rozelle, Sydney, N.S.W., Australia, Manufacturing Chemist.
1903. Ellis, A. W., Public Analyst's Laboratory, Town Hall, Southwark, S.E., Analytical Chemist.
1903. Ellis, Chas. E., Iowa State College, Ames, Iowa, U.S.A., Agricultural Chemist.
1885. Ellis, C. J., Almorah Villa, Milngavie, near Glasgow, Technical Chemist.
1893. Ellis, E. Victor, 7, Hill-side Crescent, Edinburgh, Analytical Chemist.
1902. Ellis, Frederick R., 15, Shadwell Road, Bishopston, Bristol, Chemist and Druggist.
1894. Ellis, G. Beloe, 70, Chancery Lane, London, W.C., Patent Agent.
- O.M. Ellis, H., 112, Regent Road, Leicester, Chemical Merchant.
1891. Ellis, Prof. W. Hodgson, School of Practical Science, Toronto, Ont., Canada, Professor of Applied Chemistry.
1891. Ellison, Henry, Northfield, Cleckheaton, Yorks., Manufacturing Chemist.
1901. Ellms, Jos. W., Laboratory, East Court and Martin Street, Cincinnati, Ohio, U.S.A., Chemist.
- O.M. Elmore, A. S., 4, Broad Street Place, London, E.C., Electro-Metallurgist.
1904. Elson, J. Hugh, Monroe Drug Co., Unionville, Mo., U.S.A., General Manager.
1885. Elworthy, H. S., Battlefield Road, St. Albans, Herts, Sugar Works Chemist.
1901. Emerson, Dr. W. H., Georgia School of Technology, Atlanta, Ga., U.S.A., Professor of Chemistry.
1902. Emery, Arthur L., 83-85, New Montgomery Street, San Francisco, Cal., U.S.A., Chemical Engineer.
1905. Emery, Delevan, Bradford, Pa., U.S.A., Oil Refiner.
1899. Emery, E. G., c/o Pacific Coast Oil Co., Point Richmond, Cal., U.S.A., Chemist.
- O.M. Endemann, Dr. H., 23, William Street, New York City, U.S.A., Analytical Chemist.
1897. Enequist, Erik W., North 8th and Roebling Streets, Brooklyn, N.Y., U.S.A., Chemist.
1894. Enequist, John, 267, Rutland Road, Brooklyn, N.Y., U.S.A., Chemical Engineer.
1904. Englehard, Charles, 41, Cortlandt Street, New York City, U.S.A., Platinum Importer.
1895. English, Frank H., 217, Strone Road, Manor Park, E., Analytical Chemist.
1899. Enright, Bernard, Fordwick, Augusta Co., Va., U.S.A., Chemist (Virginia Portland Cement Co.).
1905. Epstein, Dr. Wilhelm, 98, Southhill Park, Hampstead Heath, N.W., Chemist.
1904. Erdmann, Prof. Dr. H., Bismarck Strasse 12 II., Charlottenburg, Berlin, Professor of Inorganic Chemistry.
1902. Erhart, Wm. H., 11, Bartlett Street, Brooklyn, N.Y., U.S.A., Manufacturing Chemist.
1904. Ermen, Walter F. A., 10, Marsden Street, Manchester, Analytical Chemist.
1888. Erskine, J. K., New Kleinfontein Co., P.O. Benoni, Transvaal, Analytical Chemist.
1897. Escher, Paul, 735, West 64th Street, Chicago, Ill., U.S.A., Chemist.
1884. Esilman, A., 25, Roe Lane, Southport, Lancashire, Analytical Chemist.
- O.M. Esteourt, C., 5, Seymour Grove, Old Trafford, Manchester, Consulting Chemist.
1905. Etheridge, Arthur T., c/o Kynoch, Ltd., Kynochtown, Essex, Chief Chemist.
1903. Euler, C. G., 18-20, Platt Street, New York City, U.S.A., Agent for Essential Oils.
1883. Evans, Enoch, 660, Coventry Road, Birmingham, Accountant.
1898. Evans, Ernest D., The Western Tanning Co., Bedminster, Bristol, Tanner.
1903. Evans, F. Sparke, Avonside Tannery, Bristol, Tanner.
1904. Evans, James Rittenhouse, 87, 4th St., Troy, N.Y., U.S.A., Assistant in Chemistry.
1905. Evans, John, 67, Surrey Street, Sheffield, Analytical Chemist.
1883. Evans, Sir John, K.C.B., F.R.S., Nash Mills, Hemel Hempstead, Herts, Paper Maker.
1889. Evans, R. E., 3, Glencoe, Stratford-on-Avon, Brewing Chemist.
1896. Evans, Dr. Thos., University of Cincinnati, Ohio, U.S.A., Instructor in Technical Chemistry.
1903. Evans, Wm. J., 91, Fulton Street, New York City, U.S.A., Manufacturing Chemist.
1898. Evans, Wm. Perceval, Canterbury College, Christchurch, New Zealand, Professor of Chemistry.
1904. Everitt, Walter, 83, The Grove, Ealing, W., Analyst.
- O.M. Evershed, F., c/o Clarke, Nickolls and Coombs, Hackney Wick, N.E., Chemist.
1903. Evershed, John, Union Oil Mills, Copenhagen Place, Limehouse, E., Chemist.
1894. Ewan, Dr. Thos., 57, Montgomerie Street, Kirkcree, Glasgow, Chemist (Aluminium Co.).
1904. Ewing, Dr. A. Ramsay, Rose Cottage, Lennoxtown, Stirlingshire, Technical Chemist.
1892. Exley, Arthur, Braemore, Vesper Road, Kirkstall, Leeds, Tanner.

F

1898. Fadó Louis, c/o Dr. F. Stockhausen, Deutsche Gold und Silber Scheide-Anstalt, Frankfurt a/M., Germany, Chemist and Director.
- O.M. Fahlberg, Dr. C., Saccharin Fabrik, Salbke-Westerhüsen a. Elbe, Germany, Manufacturing Chemist.
1902. Fahrig, Dr. Ernst, 3642, York Road, Philadelphia, Pa., U.S.A., Chief of Laboratories (Commercial Museum).
1902. Faill, Jas., 51, Partickhill Road, Glasgow, Technical Chemist.
1902. Fairchild, Benj. T., P.O. Box 1120, New York City, U.S.A., Manufacturing Chemist.
1903. Fairhall, E. J., (Journals) c/o The Powell Wood Process Syndicate, Ltd., Carpenters Road, Stratford, E., and (Subscriptions) 29, Winsham Grove, Clapham Common, S.W., Chemist.
- O.M. Fairley, T., 17, East Parade, and (Communications) 8, Newton Grove, Leeds, Analytical Chemist.
- O.M. Fairlie, H. C., Camelon Chemical Works, Falkirk, N.B., Chemical Manufacturer.
1901. Fairlie, Jas., Camelon Chemical Works, Falkirk, N.B., Manufacturing Chemist.
1894. Fairweather, Wallace, 62, St. Vincent Street, Glasgow, Patent Agent.
1902. Fairweather, Wallace C., 65-66, Chancery Lane, W.C., Engineer.
1898. Falding, F. J., 52, Broadway, New York City, U.S.A., Chemical Engineer.
1904. Falk, Milton J., 16 East 81st Street, New York City, U.S.A., Teacher of Chemistry.
1891. Fallon, J. H. M., Boulhaf-le-Dyr, Ligne de Tebessa, Algeria, Fertiliser Expert.
1897. Farmer, John E., Beddington Farm, near Croydon, Assistant Manager (Sewage Works).
- O.M. Farrant, N., c/o J. Nicholson and Sons, Chemical Works, Hunslet, Leeds, Chemist.
1897. Farrell, Frank J., 24, Primrose Mansions, Prince of Wales Road, S.W., Analytical Chemist.
- O.M. Farries, T., 12, Coleman Street, London, E.C., Manufacturing Chemist.
- O.M. Farrington, T., 5, Summerhill Terrace, Cork, Ireland, Chemical Engineer.
1902. Fasnacht, E. A., The Hollies, Clayton Bridge, Manchester, Technical Chemist.
- O.M. Faulkner, F., The Laboratory, 65, Bath Row, Birmingham, Consulting Brewer's Chemist.
1891. Fawcett, Jas. H., c/o Bank of Australasia, 4, Threadneedle Street, London, E.C., Metallurgist.

1881. Fawsitt, C. A., Atlas Chemical Works, East Nelson Street, Glasgow, Chemical Manufacturer.
1903. Fawsitt, Dr. Chas. E., Chemical Department, The University, Glasgow, Assistant in Chemistry.
1903. Feilmann, Dr. M. E., c/o John Feilmann & Co., 11, Short Hill, Nottingham, Chemist.
1892. Feld, Walther, Hönningen a Rhein, Germany, Chemical Works Director.
1897. Felix, Dr. Lorenz, 53, Rue Petit, St. Denis s. Seine, France, Technical Chemist.
1899. Ferguson, Geo., Gleniffer Soap Works, Paisley N.B., Soap Manufacturer.
1900. Ferguson, Geo. A., College of Pharmacy, 115, West 68th Street, New York City, U.S.A., Professor of Analytical Chemistry.
1896. Ferguson, J. Hart, Loch Katrine Distillery, Cumbernauld, Glasgow, Distillery Manager.
- O.M. Ferguson, Prof. J., The University, Glasgow, Professor of Chemistry.
1902. Fergusson, Donald M., c/o Asahi Sugar Refining Co., Halifax, N.S., Canada, Analytical Chemist.
1883. Fergusson, R., Prince Regent's Wharf, Victoria Docks, E., Technical Chemist.
1905. Fernberger, Harry M., c/o Acker Process Co., Niagara Falls, N.Y., U.S.A., Chemist.
1901. Ferris, Wm. S., c/o Miami Mining Co., Concord, N.C., U.S.A., Chemist.
1905. Fiebigler, Peter, 530, Canal Street, New York City, U.S.A., Colour Chemist.
1893. Fiebing, John H., 644, 28th Street, Milwaukee, Wis., U.S.A., Leather Trade Chemist.
1885. Field, E. W., Cloud House, Sandiaca, near Nottingham, Brewer.
1887. Field, S. S., 3, Glenlue Road, Blackheath, S.E., Manufacturing Chemist.
1891. Field, Wm. Eddington, 65, Sutherland Road, Armadale, Melbourne Victoria, Chemist.
1884. Filcock, P., Sunny Bank, Prestbury Road, Macclesfield, Analytical Chemist.
1900. Fillis, Frank, 43, Romilly Road, Barry, Glam., Cement Works Chemist.
1902. Finch, Chas. Alt., 130, King Street, Sydney, N.S.W., Australia, Analytical and Pharmaceutical Chemist.
1904. Finch, Martin, L., Vitriol and Chemical Works, Cattedown, Plymouth, Chairman of Directors.
1899. Fingland, Jno. J., Minas de Aznalcollar, Prov. de Sevilla, Spain, Analytical Chemist.
1899. Finley, Norval H., 6638, Deary Street, Sta. A. Pittsburg, Pa., U.S.A., Chemist.
1904. Finn, Cornelius P., Farnley Iron Works, Farnley, Leeds, Technical Chemist.
1903. Fischer, Dr. Carl, 213-215, Water Street, New York City, U.S.A., Chemist.
1903. Fish, Chas. C. R., 10, Park Square, Boston, Mass., U.S.A., Chemist.
1900. Fisher, Henry, 57, East 83rd Street, New York City, U.S.A., Teacher of Chemistry.
- O.M. Fisher, W. W., 5, St. Margaret's Road, Oxford, Chemical Lecturer.
1895. Fison, Jno., Messrs. Jas. Fison and Sons, Thetford, Norfolk, Chemical Manufacturer.
1904. Fitch, A. J., 19, Grange Road, Canonbury, N., Brewer's Chemist.
- O.M. Fitzbrown, G., Ditton Copper Works, Widnes, Metallurgist.
1897. Fitzgerald, Francis A. J., Fitzgerald and Bennie Laboratories, P.O. Box 118, Niagara Falls, N.Y., U.S.A., Chemical Engineer.
1902. FitzGibbon, Thos., 14A, Kenyon Street, Fulham, S.W., Analytical Chemist.
1900. Fitz-Randolph, R. B., State Laboratory of Hygiene, Trenton, N.J., U.S.A., Bacteriologist and Chemist.
1896. Flammer, E., Heilbronn a N., Germany, Manufacturing Chemist.
1892. Flanagan, Chas. A., 54, Gorse Street, Stretford, Manchester, Manufacturing Chemist.
1901. Flavell, Jos. W., Toronto Technical School, College Street, Toronto, Canada, Chemist.
1892. Fleming, J. Arnold, Britannia Pottery, 136, Glebe Street, Glasgow, Potter.
1903. Fleming, Jno. A., Vulcan Copper Works, 465, East Front Street, Cincinnati, Ohio, U.S.A., Engineer.
- O.M. Fletcher, A. E., Goombe Lea, Dorking, Surrey, Ex-Chief Inspector Alkali, Ac., Works.
1893. Fletcher, E. Morley, 3, Woodhouse Chf., Leeds, Alkali Works Inspector.
- O.M. Fletcher, F. W., Beauchamp Lodge, Enfield, Manufacturing Chemist.
1891. Fletcher, R. Jacques, North Gerlong, Victoria, Manufacturing Chemist.
1904. Fletcher, Wm. E., c/o Forcite Powder Co., Landuz, N.J., U.S.A., Chemist.
1901. Fleurent, Dr. E., 5, Villa du Chateau, Bois-Colombes (Seine) France, Professor of Chemistry.
1899. Foelt, Louis, 105, E. Hanover Street, Trenton, N.J., U.S.A., Civil Engineer.
1890. Foden, Alfred, 19, Lancaster Avenue, Sefton Park, Liverpool, Metallurgical Chemist.
1900. Foersterling, Dr. H., c/o Roessler Haslachel Chem. Co., Perth Amboy, N.J., U.S.A., Chemist.
1900. Fogetti, Lucien, 3722, Lake Avenue, Chicago, Ill., U.S.A., Chemist.
1895. Fogg, Chas. A., Graythorne, Albert Road, Bolton-le-Moors, Lecturer on Chemistry.
1901. Folsom, Herbert A., 254, Knight Street, Providence, R.I., U.S.A., Textile Chemist.
1900. Forbes, Eli, Lancaster Mills, Clinton, Mass., U.S.A., Chemist.
1895. Forbes, Paul R., 37, Avenue de l'Alma, Paris, Chemist and Assayer.
1893. Ford, J. B., jun., Michigan Alkali Co., Wyandotte, Mich., U.S.A., Secretary and Treasurer.
1889. Ford, Jno. S., Abbey Brewery, Edinburgh, Analyst.
1890. Ford, Geo., 18, Rue Hohenlohe, Strassburg, Alsace, Germany, Chemist.
1885. Formoy, J. Arthur, Chestham, Grange Road, Sutton, Surrey, Oil Expert.
1904. Forrest, Chas. N., New York Testing Laboratory, Long Island City, N.Y., U.S.A., Chemist.
1898. Forrest, J. Kerr, 97, Jelfcott Street, Melbourne, Victoria, Australia, Manufacturing Chemist.
1890. Forrester, A. M., c/o Laidlaw, Mackell and Co., 3400-3500, Williamsburg Avenue, Richmond, Va., U.S.A., Analytical Chemist.
1902. Forstal, Alf. E., 58, William Street, New York City, U.S.A., Consulting Gas Engineer.
1902. Forster, Ferdinand E. P., c/o Messrs. Bass and Co., 19, Guild Street, Burton-on-Trent, Chemist.
1901. Forster, Wiss E. L. B., King's College, Strand, London, W.C., Analyst.
1890. Forster, Dr. M. O., F.R.S., Royal College of Science, South Kensington, S.W., Demonstrator of Chemistry.
1884. Forster, Ralph C., c/o Messrs. Bessler, Waechter, and Co., 18 and 19, Fenchurch Street, London, E.C., Chemical Merchant.
1884. Forth, Henry, Meadowcroft, Marple, Cheshire, Drysalter.
1895. Foster, Jas., 42, Herriet Street, Pollokshields, Glasgow, Engineer.
- O.M. Foster, R. Le Neve, Harrytown Hall, Bredbury, near Stockport, Manufacturing Chemist.
1888. Foster, Wm., St. Martin's Terrace, Newton Park, Leeds, Manufacturing Chemist.
1903. Fotheringham, John, Naisori Mill, Rewa River, Fiji, Chemist.
1904. Foust, Thomas B., c/o Bon Air C. & I. Co., Allen's Creek, Tenn., U.S.A., Chemist.
1891. Fowler, Dr. Gilbert J., Broad Oak, Urmston, near Manchester, Superintendent and Chemist (Manchester Corporation Sewage Works).
1898. Fowler, Theo. V., P.O. Box 168, Buffalo, N.Y., U.S.A., Chemical Works Manager.
1896. Fox, A. Stanley, 23, South Road, Faversham, Kent, Chemist (Cotton Powder Co., Ltd.).
1898. Fox, Jno., 42, Highfield Road, Rock Ferry, Cheshire, Analyst.
1888. Fox, J. Wesley, 7, Bushell Street, Wapping, E., Salt Merchant.
- O.M. Fox, T., jun., Tonedale, Wellington, Somerset, Wool Manufacturer.

1901. France, G. Herbert, Woodroyd Dyeworks, Low Moor, Bradford, Yorks., Dyer.
1899. Franchot, Stanislaus P., c/o National Electrolytic Co., Niagara Falls, N.Y., U.S.A., Chemist.
1885. Francis, Edwld., Park Ravine, Nottingham, Chemical Lecturer.
- O.M. Francis, E. G., 29, Matheson Road, West Kensington, W., Glucose Works Manager.
- O.M. Francis, G. B., 38, Southwark Street, London, S.E., Wholesale Druggist.
- O.M. Francis, W. H., Cleveland, Thornton Road, Clapham Park, S.W., Wholesale Druggist.
1894. Frank, Jerome W., 29, Broadway, New York City, U.S.A., Chemist.
1903. Franksen, Dr. Aug., 4803, Garden Street, Bridesburg, Philadelphia, Pa., U.S.A., Chemist.
1886. Frankenburg, Isidor, Greengate Rubber Works, Salford, Manchester, India-rubber Manufacturer.
1895. Frankforter, Dr. G. B., University of Minnesota, Minneapolis, Minn., U.S.A., Prof. of Chemistry.
1904. Frankl, A., Clotilde Chemical Works, Nagy Boeskö, Hungary, Chief Manager.
- O.M. Frankland, H., Streonshalb, The Crescent, Linthorpe, Middlesbro', Analytical Chemist.
- O.M. Frankland, Prof. P. F., F.R.S., The University, Birmingham, Professor of Chemistry.
1902. Franklin, Chas. R., Gibbstown, Gloucester Co., N.J., U.S.A., Analytical Chemist.
1904. Frasch, George B., 543, Morris Avenue, Elizabeth, N.J., U.S.A., Chemist.
1901. Frasch, Hans A., c/o F. T. Falding, 52, Broadway, New York City, U.S.A., Manager.
1900. Frasch, Herman, 681, Euclid Avenue, Cleveland, Ohio, U.S.A., Oil Refiner.
1904. Fraser, Jas. D., 8, Percy Street, Ibrox, Glasgow, Chemist.
1902. Fraser, R. A., 519, Produce Exchange, Manchester, Fellmonger.
1886. Fraser, W. J., 121, Adelaide Road, London, N.W., Mechanical Engineer.
1902. Frederick, Geo. E., jun., P.O. Box 762, New York City, U.S.A., Chemical Merchant.
1903. Free, R. E., The Elms, Mistley, Essex, Maltster.
1885. Freear, H. M., Hardwick Road, Woburn Sands, Beds., Analytical Chemist.
1903. Freeman, L. E., Room 503, 26, Broadway, New York City, U.S.A., Technical Chemist.
1899. French, Alf., St. Bartholomew's Hospital, Rochester, Kent, Dispenser.
1900. French, Thos., 1, Kelynside Terrace West, Glasgow, Chemist.
1902. Frenzel, Arthur B., 1540, Sherman Avenue, Denver, Colo., U.S.A., Consulting Engineer.
1903. Frerichs, F. W., c/o Merck and Co., St. Louis, Mo., U.S.A., Manufacturing Chemist.
1888. Frew, Dr. Wm., King James' Place, Perth, N.B., Brewing Chemist.
1903. Frew, John, Dunrod Cottage, Hamilton, N.B., Chemist.
1886. Fries, Dr. Harold H., 92, Reade Street, New York City, U.S.A., Chemical Manufacturer.
1902. Fries, Jno. W., Winston, Salem, N.C., U.S.A., Cotton Manufacturer.
- O.M. Friswell, R. J., 43-45, Gt. Tower Street, London, E.C., Consulting Chemist.
1898. Frith, J. Mason, Linden Lodge, Runcorn, Cheshire, Lime Burner.
1899. Fritzsche, Karl, c/o Schimmel and Co., Miltitz, near Leipzig, Germany, Manufacturer of Essential Oils.
1890. Frost, Dr. Howard V., 3958, Drexel Boulevard, Chicago, Ill., U.S.A., Professor of Chemistry.
1884. Frost, Joe, Storths Mill, Moldgreen, Huddersfield, Manufacturing Chemist.
- O.M. Fryer, Dr. A. C., 13, Eaton Crescent, Clifton, Bristol, Alkali Works Inspector.
1904. Fryer, Percival J., 27, Minster Road, West Hampstead, N.W., Analyst.
1903. Fudge, T., 397, Avenue E., Bayonne, N.J., U.S.A., Chemist.
1889. Fuerst, Jos. F., 17, Philpot Lane, London, E.C., Chemical and Oil Merchant.

1895. Fuerst, W. F., 2, Stone Street, New York City, U.S.A., Chemical Merchant.
1894. Fuller, Chas. J. P., 79, Brownlow Road, Horwich, near Bolton, Analytical Chemist.
1902. Fuller, Henry C., 30, Irving Street, West Medford, Mass., U.S.A., Analytical Chemist.
1899. Fuller, Robt. F., Neston Park, Corsham, Wilts., Rubber Manufacturer.
1899. Fuller, W. M., c/o Morris and Griffin, Ltd., Maindee, Newport, Mon., Chemical Manufacturer.
- O.M. Fuller, Wm., 8, Orchard Road, Blackheath, S.E., Chemist.
1898. Fulmer, Elton, Pullman, Wash., U.S.A., Professor of Chemistry.
1896. Fulton-Smith, J., 20, Bold Street, Warrington, Brewer.
1885. Fyfe, Jno., 7, West George Street, Glasgow, Oil Works Director.

G

1898. Gabain, Chas. E., Messrs. Gabain Frères, Havre, France, Manufacturer of Edible Fats.
- O.M. Gabbett, E. R., 64, Vanbrugh Road, Blackheath, S.E.; (Journals) Prince Regent's Wharf, Silvertown, E., Chemical Engineer.
1904. Gadd, Henry Wippell, 100, Fore Street, Exeter, Analytical Chemist.
1890. Gajjar, T. K., Techno-chemical Laboratory, Girgaum, Bombay, India, Consulting Chemist.
1884. Gall, Henry, c/o Soc. d'Electro-Chimie, 2, Rue Blanche, Place de la Trinité, Paris, Technical Chemist.
1897. Galletly, J. C., 101, Armadale Street, Dennistoun, Glasgow, Assistant to Professor of Metallurgy.
1905. Gallinagh, James P., Electricity Works, Limerick, Ireland, Borough Electrical Engineer.
1901. Gallivan, Frank B., 113, 3rd Street, South Boston, Mass., U.S.A., Chemist.
1903. Gallum, Albert F., Milwaukee, Wis., U.S.A., Tanner.
1901. Gallup, W. Arthur, Arnold Printworks, North Adams, Mass., U.S.A., Printer.
1901. Galpin, Harry T., 55, West 57th Street, New York City, U.S.A., Chemist.
1891. Galt, Hugh Allen, Columbia Chemical Co., Barberton, Ohio, U.S.A., Works Manager.
- O.M. Gamble, Sir David, Bart., Windlehurst, St. Helens, Chemical Manufacturer.
1887. Gamble, Jas. N., The Laboratory, Procter and Gamble Co., Ivorydale, Ohio, U.S.A., Soap Manufacturer and Oil Refiner.
- O.M. Gamble, J. C., Haresfinch, St. Helens, Lanes., Chemical Manufacturer.
1894. Gane, Eustace H., 95, Fulton Street, New York City, U.S.A., Pharmaceutical Chemist.
1888. Gans, Adolf, Farbenfabrik von L. Cassella & Co., Frankfurt a. Main, Germany, Dye Works Manager.
1901. Gansser, Dr. A., c/o Messrs. Lepetit, Dollfus and Gansser, Garesio-Ponte (Provincia di Cuneo), Italy, Chemical Engineer.
1896. Gardair, Aimé, 51, Rue St. Ferréol, Marseilles, France, Director of Chemical Co.
1893. Gardiner, H. J., 90, Cannon Street, London, E.C., Chemical Manufacturer.
1891. Gardner, Walter M., Municipal Technical College, Bradford, Director of Chemistry and Dyeing Department.
1897. Garfield, Jos., Thackley, Bradford, Yorks., Civil Engineer.
1888. Garibaldi, Joachim A., 21, Church Place, Gibraltar, Chemist.
1905. Garle, John L., Sanctuary House, Tothill Street, Westminster, Consulting Chemist.
1904. Garnar, G. Lester, Monticello, Sullivan Co., N.Y., U.S.A., Superintendent of Leather Works.
1904. Garnaas, John C., 69, Barclay Street, New York City, U.S.A., Dyestuff Merchant.

1890. Garrett, E. C., Armstrong College, Newcastle-on-Tyne, Teacher of Science.
1900. Garrigues, W. E., 66, Beaver Street, New York City, U.S.A., Chemical Engineer.
1901. Garroway, Jno., 58, Buchanan Street, Glasgow, Manufacturing Chemist.
1899. Garroway, Wm., 604, Duke Street, Glasgow, Chemical Manufacturer.
1898. Garry, H. Stanley, 66, Mapperley Road, Nottingham, Manure Works Manager.
- O.M. Garton, R., Messrs. Hill, Garton, & Co., Southampton Wharf, Battersea, S.W., Glucose Manufacturer.
1893. Garton, Rd. S., Woodycrest Avenue, Highbridge, New York City, U.S.A., Chemist.
1886. Gascoyne, Dr. W. J., 2741, North Charles Street, Baltimore, Md., U.S.A., Analytical Chemist.
- O.M. Gaskell, Holbrook, Woolton Wood, Woolton near Liverpool, Alkali Manufacturer.
- O.M. Gaskell, Holbrook, jun., Erindale, Frodsham, Cheshire, Alkali Manufacturer.
1902. Gaskell, Holbrook III., Erindale, Frodsham, Cheshire, Engineer.
1897. Gaster, Leon, 32, Victoria Street, Westminster, S.W., Electrical Engineer.
1895. Gate, Tom Erskine, (Journals) The Santubong Cutch and Tanning Extract Co., Ltd., Santubong, Sarawak, Borneo, and (subscriptions) Calder House, Dewsbury, Yorks., Manufacturing Chemist.
- O.M. Gatheral, Geo., 174, Soho Hill, Handsworth, Birmingham.
1903. Gaylord, Wallace K., Throop Polytechnic Institute, Pasadena, Cal., U.S.A., Professor of Chemistry.
1904. Gazdar, J. J., 5, Wroxham Mansions, 38, Canfield Gardens, South Hampstead, N.W., and (Journals) Watson's Hotel Annex, Bombay, India, Barrister-at-Law.
1905. Geisenheimer, Albert, P.O. Box 994, New York City, U.S.A., Dyestuff Merchant.
1891. Geisler, Dr. Jos. F., New York Mercantile Exchange Building, 6, Harrison St., New York City, U.S.A., Consulting Chemist.
1901. Gemmell, G. H., 4, Lindsay Place, George IV. Bridge, Edinburgh, Analytical Chemist.
1901. Gent, Percy W., 789, Highland Avenue, Forest Hill, Newark, N.J., U.S.A., Chemist.
1897. Gent, Wm. T., Springfield, Misterton, near Gainsboro', Metallurgical Chemist.
1896. Genth, Fred. A., jun., 222, Walnut Street, Philadelphia, Pa., U.S.A., Chemist.
1902. George, Wm. K., c/o Standard Silver Co., Ltd., 35, Hayter Street, Toronto, Ont., Canada, Manufacturer.
1894. Georgi, Carl, 77, John Street, New York City, U.S.A., Aniline Colour Importer.
1903. Georgii, Max, 606 F Street, N.W., Washington, D.C., U.S.A., Patent Attorney.
1904. Gerard, Thos. A., 122, Foxhill Road, Nottingham, Soap Manufacturer.
- O.M. Gerland, Dr. B. W., 105, Plantation Street, Accrington, Consulting Chemist.
1903. Ghose, Anukul, 42, Shambazar Street, Calcutta, India, Analyst.
1891. Gibb, Thos., Wilford, Dornoch Terrace, Brisbane, Queensland, Metallurgist.
1903. Gibbings, Wm., 11, Howard Drive, Grassendale, Liverpool, Works Manager.
- O.M. Gibbins, H. B., 177, Redland Road, Bristol.
1902. Gibbon, Edw., Ynys House, Clydach, R.S.O., Glam., Works Chemist.
1904. Gibbs, A. E., Wyandotte, Mich., U.S.A., Manufacturing Chemist.
1883. Gibbs, D. Cecil, Soap Manufacturer.
- O.M. Gibbs, Wm. P., Fabriken, Hjerpen, Jemtland, Sweden, Analytical Chemist.
1893. Gibbs, W. T., Buckingham, Prov. Quebec, Canada, Manufacturing Chemist.
- O.M. Gibson, Dr. J., 20, George Square, Edinburgh, Chemical Lecturer.
- O.M. Gibson, J. M., c/o Buckley Brick and Tile Co., Buckley, via Chester Brick and Tile Manufacturer.
1905. Gibson, John, Victorian Portland Cement Works, Burnley Street North, Richmond, Vic., Australia, Manager.
1905. Gibson, Wm. E., 60, Parrock Street, Gravesend, Kent, Works Chemist.
1904. Giese, Otto E., 4, Cedar Street, Manhattan, New York City, U.S.A., Importer.
1899. Gifford, Wm. E., 408, New Jersey Railroad Avenue, Newark, N.J., U.S.A., Chemist.
1892. Gilbard, T. Francis H., 245, Dalston Lane, Hackney, N.E., Analytical Chemist.
1905. Gilbertson, Isaac H., 5, Broad Street, Rhodes, near Middleton, Lancs., Calico Printer.
1903. Gilby, Joseph W., c/o Brotherton and Co., Ltd., Haigh Park Chemical Works, Stourton, Leeds, Works Chemist.
- O.M. Gilchrist, P. C., F.R.S., Metallurgist.
1884. Gilchrist, Peter S., Charlotte, N.C., U.S.A., Chemical Engineer.
1900. Gildersleeve, W. H., Middleboro', Ky., U.S.A., Chemist.
- O.M. Giles, W. E., The Grange, Leyton, Essex, Chemical Manufacturer.
1886. Gill, Dr. Aug. H., Massachusetts Institute of Technology, Boston, Mass., U.S.A., Assistant Professor of Gas Analysis.
1900. Gill, J. Arthur, Pennsylvania, Lower Green Road, Rushall, Tunbridge Wells, Analyst.
1901. Gill, Wm. S., c/o Farquhar and Gill, North of Scotland Colour Works, Aberdeen, Colour and Varnish Manufacturer.
1903. Gillean, R. Hampson, c/o General Chemical Co., Bayonne, N.J., U.S.A., Chemist.
1901. Gilles, Wm. S., Bradford Street, Bocking, near Braintree, Essex, Technical Chemist.
1903. Gillett, Wm. Lowry, Hotel San Remo, Central Park West and 75th Street, New York City, U.S.A., Chemical Engineer.
1905. Gilliland, Elijah P., 79, Highland Avenue, Salem, Mass., U.S.A., Foreman Tanner.
1888. Gillman, Gustave, Ferrocarril de Murcia á Granada, Aguilas, Prov. de Murcia, Spain, Civil Engineer.
1892. Gilmour, J. D., 190, Butterfignins Road, Glasgow, Chemist.
1891. Gimmingham, Edw. A., 28, Stamford Hill Mansions, Stamford Hill, N., Electrician.
1900. Ginder, Wm. H., c/o American Sheet Steel Co., Vandergrift, Pa., U.S.A., Analytical Chemist.
1904. Ginsburg, Louis, 438, Main Street, New Britain, Conn., U.S.A., Match Manufacturer.
1886. Girdwood, Dr. G. P., III, University Street, Montreal, Canada, Professor of Chemistry.
1903. Gladding, Thos. S., 55, Fulton Street, New York City, U.S.A., Analytical Chemist.
1886. Glaeser, F. A., Carpenters' Road, Stratford, E., Varnish Manufacturer.
1889. Glaser, Chas., City Hall Annex, North Gay Street, Baltimore, Md., U.S.A., Consulting Chemist.
1889. Glatz, Jos., 485-493, Kent Avenue, Brooklyn, N.Y., U.S.A., Chemical Manufacturer.
1901. Glegg, Robt., 55, Falkner Street, Liverpool, Analytical Chemist.
1894. Glen, Chas., Glengowan Printworks, Caldercruix, N.B., Calico Printer.
1890. Glen, J., jun., Glengowan Printworks, Caldercruix, N.B., Calico Printer.
1900. Glendenning, Arthur, 31, Bright Street, Middlesbrough, Analytical Chemist.
1884. Glendinning, H., Winton Park, Northwich, Cheshire, Technical Chemist.
1904. Glendinning, T. A., Wellpark Brewery, Glasgow, Brewery Chemist.
1895. Glenn, Wm., Baltimore Chrome Works, 1348, Block Street, Baltimore, Md., U.S.A., Chrome Manufacturer.
1888. Gloag, Robt. F., Grove Hill, Middlesbrough, Secretary.
- O.M. Glover, G. T., 24, Craven Hill Gardens, Lancaster Gate, W., Chemical Works Manager.
1896. Glover, H., East Falls, Schuylkill, Philadelphia, Pa., U.S.A., Chemical Works Superintendent.

- O.M. Glover, W., Rio Tinto Mines, Huelva, Spain, Technical Chemist.
1903. Goetschins, Howard B., Little Ferry, N.J., U.S.A., Chemist.
1896. Goetz, Isidore, 2, Kelfield Gardens, North Kensington, W., Mine Manager.
1898. Golding, Jno., Midland Agricultural and Dairy Institute, Kingston, and (Journals) Ashby Road, Kegworth, Derby, Agricultural Chemist.
- O.M. Goldschmidt, Dr. S. A., 43-51, Sedgwick Street, Brooklyn, N.Y., U.S.A., Chemical Manufacturer.
1897. Goldschmidt, Dr. Guido, Laboratory, II Salmgasse 1, Prag, Austria, Professor in Imperial German University.
1895. Goldsmith, Byron B., 19, East 74th Street, New York City, U.S.A., Vice-President (American Lead Pencil Co.).
1899. Goldsmith, Jno. N., British Xylonite Co., Ltd., Manningtree, Essex, Chemist.
1900. Goodchild, Wm. H., (Journals) Bannie Mine, Sambas, Dutch West Borneo, and (subscriptions) Elmwood Lodge, Long Lane, Finchley, N., Chemist.
1898. Godde, J. Archibald, 16, Crampton Street, London, S.E., Analytical Chemist.
1904. Goodier, Herbert, 16, Hall Road, Shipley, Bradford, Yorks., Textile Engineer.
1904. Gooding, E. Claude, 1, Beech Villas, Yelverton, R.S.O., Devon, Chemical Student.
1898. Goodrich, Chas. G., Akron, Ohio, U.S.A., Rubber Manufacturer.
1884. Goodwin, C. C., The White House, St. John's Road, Bowdon, Cheshire, Soapmaker.
1894. Goodwin, Dr. W. L., The School of Mining, Kingston, Canada, Professor of Chemistry.
- O.M. Goppelsroeder, Dr. F., Leimenstrasse, 51, Basel, Switzerland, Professor of Chemistry.
1901. Gordon, A. T., c/o Oliver Iron Mining Co., Mount Iron, Minn., U.S.A., Chemist.
1898. Gordon, Colin, Storers' Wharf, Cubitt Town, E., and (Journals) Lynwood, Vanbrugh Hill, Blackheath, S.E., Chemical Engineer.
1884. Gordon, J. G., Queen Anne's Mansions, Westminster, S.W., Steel Manufacturer.
1883. Gore, Dr. G., F.R.S., 20, Easy Row, Birmingham, Metallurgist.
1891. Gorvin, Jno. C., English Crown Spelter Co., Ltd., Swansea, Works Manager.
- O.M. Gossage, F. H., Camp Hill, Woolton, Liverpool, Alkali Manufacturer.
1897. Gossage, W., Winwood, Widnes, Lancashire, Soap Manufacturer.
1904. Gotthelf, August H., Hastings-on-Hudson, N.Y., U.S.A., Chemist.
1890. Goulding, Sir Wm. J., Bart., 25, Eden Quay, Dublin, Manure Manufacturer.
1903. Govers, F. X., 250, Main Street, Owego, Tioga Co., N.Y., U.S.A., Manager and Chemist.
- O.M. Gow, R. J., Ivy Lea, Hough Green, near Widnes, Metallurgical Chemist.
- O.M. Gowland, W., F.R.S., 13, Russell Road, Kensington, W., Assayer and Metallurgist.
1886. Goyder, G. A., 12, Pirie Street, Adelaide, South Australia, Chemist.
1890. Grabfield, Dr. J. P., 4712, Greenwood Avenue, Chicago, Ill., U.S.A., Chemist.
1883. Graesser, R., Cefn, near Ruabon, North Wales, Manufacturing Chemist.
- O.M. Graham, Prof. C., The Reculvers, Hastings, Consulting Chemist.
- O.M. Graham, C. C., Highmoor, Ben Rhydding Road, Bkley, Yorks., Technical Chemist.
1883. Grandage, H., Bassishaw House, Basinghall Street, London, E.C., Dyer.
1897. Granger, Dr. J. Darnell, 25, All Saints Street, Nottingham, Analytical Chemist.
1900. Granja, Rafael, Ceres Chemical Co., Kingston, N.Y., U.S.A., Chemist.
1903. Grant, Henry C., c/o Grasselli Chemical Co., 63, Wall Street, New York City, U.S.A., Manager.
1896. Graves, Geo. H., c/o General Chemical Co., Bridgeport, Conn., U.S.A., Manufacturing Chemist.
1896. Graves, Walter G., 364, Harkness Avenue, Cleveland, Ohio, U.S.A., Chemist.
1895. Gray, Elisha B., c/o United Oil and Refining Co., Beaumont, Texas, U.S.A., Oil Inspector and Chemist.
1903. Gray, G. Oscar, Iron Gate, Va., U.S.A., Chemist.
1884. Gray, G. Watson, S. Inner Temple, Dale Street, Liverpool, Consulting Chemist and Assayer.
1902. Gray, J. Campbell, Glengoyt, Strines, near Stockport, Printworks Chemist.
1904. Gray, Jas., c/o Langlaagte Estate and G. M. Co., P.O. Box 98, Johannesburg, Transvaal, Chemist.
1886. Gray, Jno., 13, Queen's Road, Rock Ferry, near Birkenhead, Oil Works Chemist.
1902. Gray, John, Port Credit, Ont., Canada, Starch Manufacturer.
1903. Gray, Jno. Lathrop, c/o Tide Water Oil Co., East 22nd Street, Bayonne, N.J., U.S.A., Assistant Superintendent (Paraffin Works).
1896. Gray, Dr. Thos., 204, George Street, Glasgow, Lecturer in Chemistry.
1903. Gray, Wm. S., 76, William Street, New York City, U.S.A., Chemical Merchant.
1901. Greaves, Albert E., c/o P. Spence and Sons, Ltd., Goole Alum Works, Goole, Yorks., Works Chemist.
1891. Greaves, J. A. R., Morton, Gainsborough, Brewer.
1894. Greaves, Wm., Powell Duffryn Steam Coal Co., Aberaman, Aberdare, South Wales, Chemical Engineer and Chemist.
1894. Greeff, R. W., 20, Eastcheap, London, E.C., Chemical Agent.
1890. Green, Alfred H., Oaklands, Lowton, Newton-le-Willows, Lancs., Manufacturing Chemist.
- O.M. Green, Prof. Arthur G., 2, Dartmouth Road, Brondesbury, N.W., and Clothworkers' Department, The University, Leeds, Professor of Dyeing.
1903. Green, G. F. Dudbridge, c/o Davey and Co., Gainsborough Road, Hackney Wick, N.E., Manufacturing Chemist.
- O.M. Green, H., Hayle Mill, Maidstone, Paper Manufacturer.
1896. Green, Jno. Wilberforce, 22, Alwyne Mansions, Wimbledon, Technical Chemist.
- O.M. Green, L., Lower Tovil, Maidstone, Paper Manufacturer.
- O.M. Greenaway, A. J., The Orchard, Chertsey, Surrey, Sub-Editor of Chemical Society's Journal.
1884. Greenhaigh, Jas. Herbert, Whitebirk, Green Mount, Bury, Lancs., Assistant Manager of Printworks.
- O.M. Greenway, T. J., Chillagoe, North Queensland, Australia, Metallurgist.
1902. Greenwood, Conrad Varley, Green Hill, Colne, Lancs., Cotton Mill Manager.
- O.M. Greenwood, Holmes, Regent House, Hartmann Street, Accrington, Lancashire, Technical Chemist.
1897. Gref, Anthony, 40, Stone Street, New York City, U.S.A., Patent Lawyer.
1905. Greiner, F. M., Ensley, Alabama, U.S.A., Steel Melter.
- O.M. Greville, H. L., 51, Hafton Road, Catford, S.E., Consulting Chemist.
1900. Griffin, Dr. Jno. J., Catholic University of America, Washington, D.C., U.S.A., Professor of Chemistry.
1890. Griffin, Jno. R., 20-26, Sardinia Street, Lincoln's Inn Fields, W.C., Chemical Apparatus Maker.
1886. Griffin, Martin L., Mechanieville, Saratogo Co., N.Y., U.S.A., Consulting Chemist.
- O.M. Griffith, R. W. S., Eyeworth Lodge, Lyndhurst, Hants, Gunpowder Manufacturer.
1902. Griffiths, Manfred E., Fernside, Childer Road, Stowmarket, Suffolk, Explosives Chemist.
1894. Griffiths, Thos., The Cedars, Clapham Common, S.W., Manufacturing Chemist.
1902. Grimwade, Wilfrid R., (Journals) 342, Flinders Lane, Melbourne, Vic., Australia; (subscriptions) c/o Grimwade, Ridley and Co., 6, Trinity Square, London, E.C., Manufacturing Chemist.

- O.M. Grimwood, R., 41, Lady Margaret Road, London, N.W., Analytical Chemist.
1900. Grimwood, Robt. G., 17, Dagmar Road, Stroud Green, N., Analytical Chemist.
- O.M. Grindley, J., Upper North Street, Poplar, London, E., Tar Distiller.
1905. Grip, August E., 194, Lee Avenue, Brooklyn, N.Y., U.S.A., Chemical Engineer.
1888. Gripper, Harold, Great Central Railway, Gorton, Manchester, Analytical Chemist.
1903. Griswold, Geo. G., Globe Plant, A. S. and R. Co., Denver, Colo., U.S.A., Assistant Superintendent.
1897. Gronemeyer, Herman H., 315, Amesbury Avenue, Cleveland, Ohio, U.S.A., Chemical Superintendent.
1900. Gross, Abraham, 341, Oakland Avenue, Pittsburg, Pa., U.S.A., Technical Chemist.
1904. Gross, Hy. B., Royal Societies Club, St. James Street, London, S.W., Chemical Manufacturer.
- O.M. Grossmann, Dr. J., Northern Assurance Buildings, Albert Square, Manchester, Consulting Chemist and Chemical Engineer.
1896. Grosvenor, Wm. M., jun., c/o General Chemical Co., 25, Broad Street, New York City, U.S.A., Electro-Chemist.
- O.M. Groves, C. E., F.R.S., 352, Kennington Road, London, S.E., Chemist (Thames Conservancy).
1903. Grundy, F. Barnes, Victoria Mills, Bredbury, near Stockport, Technical Chemist.
1899. Gudemann, Dr. Edw., 4319, Vincennes Avenue, Chicago, Ill., U.S.A., Chemist.
1902. Guenther, Felix, jun., c/o Crescent Portland Cement Co., Wampan, Pa., U.S.A., Chemist.
1898. Guess, Harry A., c/o Cananea Consolidated Copper Co., Cananea, Sonora, Mexico, Chemist.
1899. Guest, Edw. Graham, 5, Church Hill, Edinburgh, Cereals Chemist.
1903. Guest, Hon. Lionel G., 58, Metcalfe Street, Montreal, Quebec, Canada, Engineer.
1899. Guild, Frank N., University of Arizona, Tucson, Arizona, U.S.A., Professor of Chemistry.
1900. Guitermann, Edw. W., Passaic Printworks, Passaic, N.J., U.S.A., Chemist.
1894. Gulliver, Geo. W., c/o Burt, Boulton, and Haywood, Selzaete, Belgium, Chemist.
1904. Gundlach, Walter, 153, East 79th Street, New York City, U.S.A., Superintendent of Colour Works.
1905. Gundlich, Dr. Charles, c/o Thorium Chemical Co., Maywood, N.J., U.S.A., Technical Chemist.
1903. Gunn, Gilbert, 181, Bury New Road, Summit, Heywood, Lancs., Paper Mill Chemist.
1883. Gunn, W. L., Broad Plain Soap Works, Bristol, Analytical Chemist.
1900. Günther, Chas. E., Liebig's Extract of Meat Co., Ltd., 4, Lloyd's Avenue, London, E.C., Merchant.
1902. Günther, Wm. J. W., Colonial Sugar Refining Co., Ltd., O'Connell Street, Sydney, N.S.W., Australia, Inspector.
1894. Gurney, J. Clare, Fabrica Roma, La Union, Prov. de Murcia, Spain, Analytical Chemist.
1899. Gutscher, Wm., Singapore Oil Mills, Singapore, S.S., Superintendent Engineer.
1903. Guthrie, Alan, c/o Cooper, Allen and Co., Cawnpore, India, Leather Chemist.
1903. Guthrie, Alex., The Cottage, Bocking, Braintree, Essex, Manager.
1892. Guthrie, John, Trentham Street, Dewsbury Road, Leeds, Chemical Works Manager.
1901. Guthrie, John M., 199, Ferry Road, Leith, N.B., Analytical Chemist.
1903. Guttmann, Dr. Leo F., 18, Aberdare Gardens, West Hampstead, N.W.; and (Journals) University College, Gower Street, W.C., Research Chemist.
1892. Guttmann, Oscar, 12, Mark Lane, London, E.C., Consulting Chemical Engineer, M.Inst.C.E.
1904. Gyr, Dr. K. H., c/o Messrs. Joseph Fison and Co., Ltd., Ipswich, Analytical Chemist.
1902. Haas, Herbert, c/o Great Western Gold Co., Redding, Cal., U.S.A., Chemist and Metallurgist.
- O.M. Habushaw, W. M., Glenwood Works, Yonkers, N.Y., U.S.A., Chemical Engineer.
1904. Hacking, D. H., Hendfield House, Clayton-le-Moors, near Accrington, Lancs., Soap Manufacturer.
1883. Hacking, W. H., The Grange, Clayton-le-Moors, near Accrington.
1900. Haddock, Arthur G., c/o Castner-Kellner Alkali Co., Ltd., Weston Point, Runcorn, Cheshire, Technical Chemist.
1898. Haddow, Geo., Parkview, Redding, Polmont Station, N.B., Chemist.
1887. Hadfield, R. A., Newhall Road, Attercliffe, Sheffield, Steel Founder.
1884. Hadkinson, E., Pamphila Oil and Soap Works, Mitylene, Mediterranean, Oil Refiner and Soap Manufacturer.
- O.M. Hadkinson, R., Smyrna, Asia Minor, Oil Refiner.
1904. Hadley, Geo., 58, Halesowen Street, Blackheath, Staffs., Spelter Works Manager.
1902. Hafl, Max M., 77, Gloucester Street, Ottawa, Canada, Chemist.
1887. Haig, Robert, Mechanical Retorts Co., Ltd., Murray Street, Paisley, N.B., Chemical Engineer.
1904. Haigh, B. Wilson, 4, York Street, Barnsley, Yorks., Chemical Engineer.
1896. Haigh, De Lague, 33, Norwood Avenue, Summit, N.J., U.S.A., Chemist.
1898. Haigh, Frederic, Matteawan, N.Y., U.S.A., Chemist.
1898. Haigh, Percy, c/o Messrs. Bird Bros., Duxford, Cambridge, Analytical Chemist.
1888. Hailes, A. J. de, 15, Red Lion Square, London, W.C., Analytical Chemist.
1889. Haines, Reuben, Haines Street, near Chew Street, Germantown, Philadelphia, Pa., U.S.A., Analytical Chemist.
- O.M. Hake, C. N., 423, Flinders Lane, Melbourne, Victoria, Australia, Inspector of Explosives.
1903. Halbert, Thos., c/o British South African Explosives Co., Modderfontein, Transvaal, Chemist.
1903. Hale, Dr. Frank E., Mount Prospect Laboratory, Flatbush Avenue and Eastern Parkway, Brooklyn, N.Y., U.S.A., Chemist.
1888. Hale, Edw. P., c/o Wakefield and Co., Gatebeck, Kendal, and (communications) Endmoor, near Kendal, Analytical Chemist.
1887. Hall, Allan T., c/o Sissons Bros. and Co., Ltd., Hull, Oil Refiner and Varnish Manufacturer.
1905. Hall, Archibald A., Armstrong College, Newcastle-on-Tyne, Demonstrator in Chemistry.
1886. Hall, Archibald D., 7, Fenchurch Avenue, London, E.C., Analytical Chemist.
1898. Hall, Clarence A., 517, North American Building, Philadelphia, Pa., U.S.A., Chemist.
- O.M. Hall, Edgar, Silver Spur, Stanthorpe, Queensland, Australia, Technical Chemist.
1902. Hall, Geo., c/o A. A. Vantine and Co., Froa Iway and 18th Street, New York City, U.S.A., Chemist.
1902. Hall, Henry, c/o Booth and Co., Ark Vale Works, Middleton, Lancashire, Dyer and Finisher.
1893. Hall, Jas. W., Bombay, Baroda and Central India Railway, Subarnata, near Ahmedabad, India, Linseed Oil Mills Manager.
1885. Hall, Jno. A., Victoria Chemical Works, Victoria, British Columbia, Analytical Chemist.
1900. Hall, Jos. J., 414, Fifth Avenue, Cedar Rapids, Iowa, U.S.A., Chemist.
- O.M. Hall, S., East London Soap Works, Bow, London, E., Soap Manufacturer.
1896. Hall, S. Godfrey, East London Soap Works, Bow, E.; (Journals) 19, Aberdeen Park, Highbury, N., Soap Maker.
1886. Haller, Geo., Sussex House, 52, Leadenhall Street, London, E.C., Chemical Merchant.
1893. Haller, H. Lott, 26, Scale Lane, Hull, Analytical Chemist.
1895. Halliwell, Edw., c/o Ribble Joint Committee, 2, Stanley Place, Preston, Chief Inspector.

1901. Hallock, Dr. Albert P., 440, First Avenue, New York City, U.S.A., Chemist.
1892. Hamaguchi, K., Hiro Mura, Arito Gori, Wakayama Ken., Japan, Soy Manufacturer.
1904. Hamblet, Abel Martin, c/o Oxford Paper Co., Rumford Falls, Maine, U.S.A., Chemist.
1897. Hamblly, Fred. J., Buckingham, Quebec, Canada, Chemist.
1901. Hambuechen, Carl, c/o Pittsburg Reduction Co., East St. Louis, Ill., U.S.A., Electro-Chemist.
1904. Hamilton, E. H., Anaconda Copper Mining Co., Anaconda, Montana, U.S.A., Asst. Superintendent.
1885. Hamilton, Oswald, Lancaster Cottage, Old Stratford, near Stony Stratford, Chemical Engineer.
1884. Hamilton, Robert, Glengarnock Chemical Co., Ltd., Glengarnock, N.B., Works Manager.
1892. Hamilton, Robt., 62, Tempest Road, Beeston Hill, Leeds, Analytical Chemist.
- O.M. Hammill, M. J., The Gables, St. Helens, Alkali Manufacturer.
1898. Hammersley, W. Stanley, Longjumeau, S. et O., France, Tanner.
1892. Hammond, Geo. W., Yarmouthville, Maine, U.S.A., Paper Co.'s Agent.
1904. Hammond, H. S., Government Laboratory, Kingston, Jamaica, Analyst.
- O.M. Hammond, J., Gas Works, Eastbourne, Sussex, Gas Manager.
1902. Hampson, B. A., "Hampson's Buildings," Smith Street, Durban, Natal, S. Africa, Assayer.
1900. Hampton, F. T., Hill City, Tenn., U.S.A., Civil Engineer.
1900. Hancock, Walter C., 10, Upper Chadwell Street, Myddelton Square, London, E.C., Chemist.
1896. Hand, Daniel, 30, Mount Pleasant Avenue, Newark, N.J., U.S.A., Chemist.
1889. Handy, Jas. O., 325, Water Street, Pittsburg, Pa., U.S.A., Chemist.
1888. Hanks, Abbot A., 531, California Street, San Francisco, Cal., U.S.A., Assayer.
1901. Hanna, Charles E., P.O. Box 2303, Montreal, Canada, Secretary.
1899. Hanna, Dillinger C., 4262, Parkside Avenue, Philadelphia, Pa., U.S.A., Chemist and Superintendent.
- O.M. Hanson, A. M., Abbey Printworks, Whalley, Blackburn, Print Works Chemist.
1905. Hanson, H. Norman, Field Head, Brighouse, Yorks., Research Assistant.
1905. Harcourt, Prof. R., Ontario Agricultural College, Guelph, Ont., Canada, Professor of Chemistry.
1904. Hard, Dr. James, M.B., Cordobanes 16, Mexico City, Mexico, Chemist and Pathologist.
1901. Harcastle, G. Fred., 17, Chaucer Street, Leicester, Teacher of Science and Technology.
1894. Harden, Dr. Arthur, c/o British Institute of Preventive Medicine, Grosvenor Road, London, S.W., and (communications) 2, Marlborough Road, Richmond, S.W., Lecturer in Chemistry.
1900. Hardwick, W. Roscoe, 13, Batavia Buildings, Hackins Hey, Liverpool, Chemist.
1902. Hardy, G. B., Belmont Gold Mine, Cordova, Ont., Canada, Metallurgist.
1896. Hargreaves, Jas., Farnworth, Widnes, Lancashire, Chemical Engineer.
- O.M. Hargreaves, Jno., Widnes, Alkali Manufacturer.
1904. Harker, Dr. George, 35, Boulevard, Peterham, Sydney, N.S.W., Australia, Chemist.
- O.M. Harland, R. H., Plough Court, 37, Lombard Street, London, E.C., Consulting Chemist.
1904. Harley, B., 12, Russell Street, Falkirk, N.B., Analytical Chemist.
1893. Harlock, E. B., Newton House, Middlewich, Chemical Manufacturer.
1898. Harman, Edw. A., Gas Works, Huddersfield, Gas Engineer, M.Inst.C.E.
1905. Harper, Dr. Henry W., University of Texas, 2208, San Antonio Street, Austin, Texas, U.S.A., Professor of Chemistry.
1904. Harriman, Norman F., c/o Union Pacific Railroad, Laboratory, Omaha, Neb., U.S.A., Chemist.
1904. Harrington, Dr. B. J., MacDonald Chemical and Mining Building, McGill University, Montreal, Canada, Director.
1903. Harrington, E. M., 79, Fair Street, Paterson, N.J., U.S.A., Explosives Manufacturer.
- O.M. Harrington, W. B., Leeview, Montserrat, Cork, Ireland, Chemical Manufacturer.
1893. Harris, Arthur, 22, Marsh Gate Lane, Stratford, E., Soap Maker.
1885. Harris, Booth, jun., Beeleigh, Victoria Road, Buckhurst Hill, Essex, Soap Maker.
- O.M. Harris, David, F.R.S.E., Lyncombe Rise, Prior Park Road, Bath, Chemical Manufacturer.
1897. Harris, Fred. W., Corporation Chemical Department, 26, John Street, Glasgow, Public Analyst.
1900. Harris, L. A., Wyoming, Wood Vale, Lordship Lane, London, S.E., Chemist.
1904. Harris, Norman B., (Journals) to Upper Montclair, N.J., and (communications) 50, West Broadway, New York City, U.S.A., Manufacturing Pharmacist.
1896. Harris, Wm. T. A., Ideal Soapery, East Street, Brompton, Adelaide, South Australia, Soap Maker.
- O.M. Harrison, A., Thames Sugar Refinery, Silvertown, London, E., Sugar Works Chemist.
- O.M. Harrison, G. D., c/o United Alkali Co., Ltd., Netham Works, Bristol, Chemical Manufacturer.
1883. Harrison, G. Herbert, c/o Electrolytic Alkali Co., Ltd., Middlewich, Cheshire, Chemist.
1884. Harrison, G. King, Fireclay Mine Owner.
1904. Harrison, H. E., 1688, Buckingham Place, Chicago, Ill., U.S.A., Chemist.
1892. Harrison, Prof. John B., C.M.G., Government Laboratory, Georgetown, Demerara, B.G., Government Analyst.
1898. Harrison, Wm. H., 29, Avenue Crescent, Harehills Lane, Leeds, Analytical Chemist.
1896. Hart, Bertram, c/o Tennants and Co., Clayton, Manchester, Analyst.
1886. Hart, Bertram H., The Elms, Old Charlton, S.E., Analytical Chemist.
- O.M. Hart, Dr. E. Gayley Hall, Lafayette College, Easton, Pa., U.S.A., Professor of Chemistry.
1890. Hart, H. W., 13, Lynwood Villas, Darwen, Lancashire, Analytical Chemist.
1897. Hart, Wm. Beaumont, Manchester Laboratory, 8, Exchange Street, Manchester, Consulting Chemist.
1883. Hartley, Joseph, 102, Kirkmanshulme Lane, Longsight, Manchester, Technical Chemist.
1889. Hartley, R. Kent, Springwood House, Middleton Junction, near Manchester, Chemical Works Manager.
- O.M. Hartley, Prof. W. N., D.Sc., F.R.S., Royal College of Science, Dublin, Professor of Chemistry.
1897. Hartmann, Ernest E., (Journals) 303 Boston Building, and (communications) Box 154 Honolulu, Hawaii, Chemist.
1892. Hartridge, Jas. Hills, Holmwood, Hendon, N., Manufacturing Chemist.
1901. Hartwell, S. Warren, 215, North 2nd Street, Easton, Pa., U.S.A., Chemist.
1901. Hartzell, Harry S., 126, North 4th Street, Allentown, Pa., U.S.A., Chemist.
1899. Harvey, Chas., 17, Alloa Road, Goodmayes, Ilford, Essex, Manufacturing Chemist.
1892. Harvey, E. Feild, Omrac, St. John's, Newfoundland, Chemist.
1885. Harvey, Ernest W., Stoneleigh, Grove Road, Clapham Park, S.W., A.R.S.M., Engineer.
1888. Harvey, H. C., Raglan House, Brooklands, near Manchester, Chemist.
1904. Harvey, John G., Todmorden, Ontario, Canada, Manufacturing Chemist.
1891. Harvey, Sidney, South-Eastern Laboratory, Canterbury, Analytical Chemist.
1899. Harvey, Thos. F., 84, Henry Road, West Bridgford, Nottingham, Analyst (Drug Co.).
1883. Harvey, T. H., Cattedown, Plymouth, Chemical Manufacturer.

1903. Hasenclever, Max, Chemische Fabrik Rhenania, Aachen, Prussia, Chemical Manufacturer.
1900. Haslwanter, Chas., 908, Willoughby Avenue, Brooklyn, N.Y., U.S.A., Analytical Chemist.
1897. Hasslacher, Jacob, P.O. Box 1999, New York, U.S.A., President, Roessler-Hasslacher Chemical Co.
1903. Hastings, J. J., c/o Benjamin Moore and Co., 244-259, Water Street, Brooklyn, N.Y., U.S.A., Chemist.
1894. Hatfield, Jno. A., c/o J. Lysaght, Ltd., Orb Iron-works, Newport, Mon., Analytical Chemist.
1903. Hatschek, Emil, c/o The Niles-Cement Pond Co., 138, Liberty Street, New York City, U.S.A., Engineer.
1887. Hatton, Wm. P., c/o W. R. Hatton and Sons, Wormwood Scrubs, W., Starch Works Manager.
1900. Havens, Dr. F. S., c/o Franklin H. Kalbaleisch Co., 35, Burling Slip, New York City, U.S.A., Silk Conditioner.
1899. Hawdon, H. S., Harton Road, Westoe, South Shields, Manager.
1895. Hawker, E. W., Adelaide Club, Adelaide, South Australia, Metallurgist.
1902. Hawkins, Clement C., c/o The Chattfield Manufacturing Co., Carthage, Ohio, U.S.A., Chemist.
1897. Hawkins, Ernest M., Lime Tree Farm House, Stone Street, Petham, Canterbury, Chemist.
- O.M. Hawkins, H., Concord Junction, Mass., U.S.A., Explosive Works Manager.
1893. Hawkins, J. Dawson, c/o Colo. Phila. Reduction Co., Colorado City, Colo., U.S.A., Smelting Works Manager.
1905. Hawley, Fred G., Box 10, La Cananea, Sonora, Mexico, Assayer and Chemist.
1887. Hawliczek, Josef, 77A, Lord Street, Liverpool, Consulting Chemical Expert.
1899. Haworth, Dr. Edw., Sunnyside, Norman Road, Runcorn, Cheshire, Chemist.
1903. Haworth, Herbert, Crown Works, Appley Bridge, near Wigan, Director (Grove Chemical Co.).
1904. Hawthorn, J. H., Municipal Technical School, Leicester, Head Master.
1895. Hay, Alex. B., Kelyindock Chemical Works, Maryhill, Glasgow, Manufacturing Chemist.
1898. Hayercraft, Jos. H., St. Peter's, Adelaide, South Australia, Metallurgical Chemist.
1904. Hayman, Jack Y. J., Semper Aurea, Barwell, Cambridge, Chemist.
1894. Haynes, David O., 90, William Street, New York City, U.S.A., Proprietor, "Pharmaceutical Era."
1902. Hays, B. F., c/o Fraser Tablet Co., 454-474, 18th Street, Brooklyn, N.Y., U.S.A., Chemist.
1902. Hazard, Dr. Elmer C., Shrewsbury, N.J., U.S.A., Chemist.
1903. Hazen, Chas. R., Collingwood, Ohio, U.S.A., Chemist.
1894. Heal, Carlton, Duston, near Northampton, Chemist.
1903. Heald, Henry L., Wherside, Windsor Road, Doncaster, Manager of Earthenware Factory.
1899. Healey, Alfred E., Willesden Paper and Canvas Works, Willesden Junction, N.W., Managing Director.
1890. Heape, Chas., 19, George Street, Manchester, Calico Printer.
1898. Heasman, Walter, Castle Brewery, Bridgnorth, Salop, Brewer.
- O.M. Heath, R. C., Myton Grange, near Warwick, Chemical Manufacturer.
1904. Heaton, Noel, 20, Baker Road, Harlesden, N.W., Colour Manufacturer.
1895. Hebbin, Jno. C., 64, Exchange Place, Providence, R.I., U.S.A., Works Manager and Chemist.
1889. Hecht, Jos. L., Bettendorf Metal Wheel Co., Davenport, Iowa, U.S.A., Analytical Chemist.
1895. Hecker, Paul, 102, Fenchurch Street, London, E.C., Chemical Merchant.
1900. Heckman, J. Conrad, Larkin Soap Manufacturing Co., Seneca Street, Buffalo, N.Y., U.S.A., Chemist.
1889. Heckmann, C., 9, Görlitzerufer, Berlin, S.O., Germany, Chemical Apparatus Maker.
1885. Hedley, Armorer, Durrant House, Bournemouth, Hants., Soap Manufacturer.
1895. Hedley, Geo. H., Hedge Mill, Loudwater, Bucks., Chemical Manufacturer.
1902. Hechner, Prof. Cha. F., Ontario College of Pharmacy, Toronto, Canada, Professor of Pharmaceutical Chemistry.
1903. Hegeman, John W., 102, Barbey Street, Brooklyn, N.Y., U.S.A., Chemist.
- O.M. Behner, Otto, H., Billiter Square, London, E.C., Analytical and Consulting Chemist.
1902. Heike, Rudolph E., American Sugar Refining Co., P.O. Box 12, Jersey City, N.J., U.S.A., Chemist.
1898. Heileman, W. H., (communications) U.S. Department of Agriculture, Bureau of Soils, Washington, D.C.; and (Journals) Cambridge, Iowa, U.S.A., Expert Field Assistant.
1887. Hellier, E. A., Avonside Varnish Works, Bristol Varnish Manufacturer.
1885. Hellon, Dr. R., 40, New Lowther Street, Whitehaven, Analytical and Consulting Chemist.
- O.M. Helm, H. J., Simonstone, Hammeton Road, Bromley, Kent, Government Analyst.
1903. Helps, D. H., c/o Reading Gas Co., King's Road, Works, Reading, Engineer and Manager.
1898. Hemingway, Frank C. R., 133, Front Street, New York City, U.S.A.
1883. Hemingway, H., Marsh Gate Lane, Stratford, E., Chemical Manufacturer.
1884. Hempleman, F. S., Wennington House, Wennington, Romford, Essex, Manure Manufacturer.
1903. Hemstreet, George P., Hastings-on-Hudson, N.Y., U.S.A., Mechanical Engineer.
1883. Henderson, Prof. G. G., The Technical College, George Street, Glasgow, Professor of Chemistry.
1902. Henderson, Prof. Jas. A. Russell, c/o Dr. Chas. D. Tenney, Tientsin, North China, Professor of Chemistry and Physics.
1900. Henderson, J. Brownlie, Government Analyst's Office, Brisbane, Queensland, Government Analyst.
1902. Henderson, J. C. A., 4, Sun Court, Cornhill, London, E.C.
1894. Henderson, Jos., Thornaby Ironworks, Thornaby-on-Tees, Metallurgical Chemist.
1894. Henderson, Norman M., Broxburn Lodge, Broxburn, N.B., Oil Works Manager.
- O.M. Henderson, W. F., Moorfield, Claremont Gardens, Newcastle-on-Tyne.
1893. Hendrick, Jas., Marischal College, Aberdeen, Lecturer on Agricultural Chemistry.
1904. Henley, F. R., 9, Beaufort Gardens, London, S.W., Brewer's Chemist.
1889. Hennin, Alphonse, Portoferraio, Elba, Italy, Metallurgical Chemist.
1905. Henning, Albert, 92, Harrow Road, Leytonstone, N.E., Chemical Manufacturer.
1904. Henshaw, Percy B., 3, Dobbin Hill, Endcliffe, Sheffield, Steel Chemist.
1894. Henshaw, Sam., Glenthorne, Wolstanton, Stoke-on-Trent, Chemical Works Manager.
1894. Hepburn, J. G., Priory Works, Dartford, Kent, Leather Manufacturer.
1894. Heriot, T. H. P., 23, Wolsley Road, Crouch End, N., Analytical Chemist.
- O.M. Herman, W. D., Holm Lea, Rainhill, Lancashire, Glass Works Chemist.
1904. Hermsdorf, Dr. Walter, Salzstrasse 69, Chemnitz, Saxony, Chemist.
- O.M. Heron, J., 110, Fenchurch Street, London, E.C., Brewing Chemist.
1903. Herreshoff, J. B. F., 40, West 69th Street, New York City, U.S.A., Chemical Engineer.
1899. Herriek, Rufus F., 16, Herriek Street, Winchester, Mass., U.S.A., Chemist.
1887. Herriot, Wm. Scott, 19, Kier Street, Pollokshields, Glasgow, Chief Engineer.
- O.M. Herrmann, R. W., 59, Mark Lane, London, E.C., Chemical Merchant.

1891. Hersam, Ernest A., University of California, Berkeley, Cal., U.S.A., Assistant Professor of Metallurgy.
- O.M. Herschel, Prof. A. S., F.R.S., Observatory House, Slough, Bucks., Hon. Professor of Experimental Physics.
1898. Hersey, Milton L., P.O. Box 554, Montreal, Canada, Consulting Chemist.
1901. Hershey, Aldus N., c/o Sharpe and Dohme, Baltimore, Md., U.S.A., Chemist.
1903. Herstein, Dr. Bernard, 9A, Trask Avenue, Bayonne, N.J., U.S.A., Technical Chemist.
1898. Heslop, Oliver, 55, Sandown Lane, Wavertree, Liverpool, Analytical Chemist.
1885. Hess, Dr. Adolph, Kirkstall Road, Leeds, Chemical Manufacturer.
1904. Hess, H. W., c/o Toledo Gas Light and Coke Co., 327, South Erie Street, Toledo, Ohio, U.S.A., Chemist.
1891. Hetherington, Dr. Albert E., Ammonia Soda Works, Fleetwood, Lancashire, Analytical Chemist.
1904. Heinrich, Christian, 1307, New Hampshire Avenue, N.W., Washington, D.C., U.S.A., Brewer.
1894. Hewitt, A. H., The Green Island Cement Co., Ltd., Hong Kong, China, and (Journals) Spring Vale, near Gurnard, Isle of Wight, Engineer.
- O.M. Hewitt, Dr. D. B., Oakleigh, Northwich, Cheshire, Alkali Manufacturer.
1903. Hewitt, H. R., 329, Bradford Road, Manchester, Chemical Works Manager.
1896. Hewitt, Dr. J. Theo., 8, Montpelier Road, East Twickenham, Lecturer.
1890. Hewlett, John C., 40-42, Charlotte Street, Great Eastern Street, London, E.C., Manufacturing Chemist.
1893. Hey, Harry, 2, Ash Terrace, Savile Town, Dewsbury, Dyer.
1894. Heyl-Dia, G. Edw., Chemical Engineer.
1901. Heys, Thos., 114, Bay Street, Toronto, Canada, Consulting Chemist.
1884. Heys, W. E., Llanberis, Bushey Hall Road, Watford, Consulting Engineer.
1883. Heywood, J. H., 231, Drake Street, Rochdale, Technical Chemist.
- O.M. Heywood, J. S., 7, Caledonian Road, King's Cross, London, N., Chemical Manufacturer.
1897. Hibbard, Paul L., 2657, North 42nd Court, Chicago, Ill., U.S.A., Starch Chemist.
1901. Hiby, Dr. Walter, 4, Southampton Row, London, W.C., Chemical Engineer.
1897. Hicks, Edwin F., 4837, Fairmount Avenue, Philadelphia, Pa., U.S.A., Analytical Chemist.
1893. Hicks, Jas. A., c/o Dr. B. Redwood, 4, Bishopsgate Street Within, London, E.C., Analytical Chemist.
- O.M. Higgin, W. H., Hollywood, Lostock, near Bolton-le-Moors, Chemical Manufacturer.
1886. Higgins, C. L., 79, Bedford Street South, Liverpool, Manufacturing Chemist.
1905. Higgins, J. M., 39, Queen Street, Melbourne, Vic., Australia, Consulting Metallurgist.
1901. Highley, Arnold, 20, Spotland Road, Rochdale, Chemist.
1904. Hildebrand, Charles C., 113, Metoxan Avenue, Ridgeway, Pa., U.S.A., Chemist.
1903. Hill, Chas. Alex., 64, Park Street, Southwark, S.E., Wholesale Druggist.
1897. Hill, George, Barton-on-Humber, Chemical Works Manager.
1897. Hill, Dr. Herbert M., University of Buffalo, N.Y., U.S.A., Professor of Chemistry and Toxicology.
- O.M. Hill, J. K., 13, Osborne Place, Copland Road, Govan, near Glasgow, Manufacturing Chemist.
1892. Hill, Sydney, c/o Blundell Spence and Co., Ltd., Hull, Analytical Chemist.
1903. Hill, W. Basil, James Street Leather Works, York, Tanner.
1902. Hill, Wm. G. H., jun., American Rubber Co., East Cambridge, Mass., U.S.A., Chemist.
1898. Hill-Jones, Thos., 30, Bisham Gardens, Highgate, N., Manufacturing Chemist.
- O.M. Hills, C. H., Anglesea Copper Works, Low Walker, Newcastle-on-Tyne, Copper Smelter.
1894. Hills, Harold F., Commercial Gas Works, Stepney, London, E., Analytical Chemist.
1898. Hills, Thos. Herbert, Chemical Works, Deptford, S.E., Chemical Manufacturer.
- O.M. Hills, W., 225, Oxford Street, London, W., Pharmaceutical Chemist.
1893. Hilton, Edgar G., 17, Howard Drive, Grassendale, Liverpool, Varnish and Paint Manufacturer.
1899. Hinchley, J. W., Royal Mint, Bangkok, Siam, Chemical Engineer.
1904. Hinchley, J. F., c/o Jones Bros., Pearl and Water Streets, Brooklyn, N.Y., U.S.A., Chemical Engineer.
1905. Hind, H. Lloyd, 55, Stanton Road, Burton-on-Trent, Analytical Chemist.
- O.M. Hindle, J. H., 8, Cobham Street, Acerington, Dye-works Manager.
1899. Hinks, Percy J., Danger Building Dept., Royal Laboratory, Woolwich Arsenal, S.E., Chemist.
1891. Hinman, Bertram C., 23, Trewsbury Road, Sydenham, S.E., Metallurgical Chemist.
1892. Hinshelwood, Thos., Glasgow Oil and Paint Works, Glenpark Street, Glasgow, Oil Refiner.
1900. Hirsh, Jos. E., 1245, 85th Street, Brooklyn, N.Y., U.S.A., Chemist.
1903. Hirschfield, E., c/o Maas and Waldstein Co., Riverside Avenue, Newark, N.J., U.S.A., Chemist.
1895. Hirst, H. Reginald, Croft House, Batley, Yorks., Works Chemist.
1886. Hislop, Geo. R., (Journals) Gas Works, (communications) Greenhill House, Underwood Road, Paisley, N.B., Gas Engineer and Manager.
1900. Hobbs, Alex. F., Rolfe Street, Lowell, Mass., U.S.A., Printworks Superintendent.
1900. Hobbs, Dr. Perry L., Western Reserve Medical College, Cleveland, Ohio, U.S.A., Professor of Chemistry.
1905. Hobson, Alfred, Dantzie Brewery, Imperial Street, Regent Street, Leeds, Brewer and Wine Manufacturer.
1904. Hochstetter, Henry, Ault and Wiborg Co., Cincinnati, Ohio, U.S.A., Chemist.
1894. Hodge, Andrew, 28, Grosvenor Road, Heaton Moor, near Stockport, Printworks Chemist.
1890. Hodges, Harry B., Long Island Railroad Co., Long Island City, N.Y., U.S.A., Chemical Engineer.
1902. Hodgkins, David H., 82, Lafayette Avenue, Passaic, N.J., U.S.A., Manufacturing Chemist.
- O.M. Hodgkinson, Dr. W. R., (Journals) 18, Glenlue Road, Blackheath, S.E.; and Royal Artillery College, Woolwich, S.E., Professor of Chemistry.
- O.M. Hodgson, Chris., 33, Oakdale Road, Nether Edge, Sheffield, Metallurgical Chemist.
1897. Hodgson, Matthew, Ardmore, Wicklow, Ireland, Technical Chemist.
1890. Hodgson, Wm., 66, Deansgate, Manchester, Oil and Colour Broker.
1903. Hoffmann, W. F., 23, Division Place, Newark, N.J., U.S.A., Chemical Merchant.
1886. Hogben, W., c/o Viscoloid Co., Leominster, Mass., U.S.A., Chemist and Superintendent.
- O.M. Hogg, T. W., c/o John Spencer and Sons, Newburn Steelworks, Newcastle-on-Tyne, Metallurgical Chemist.
1899. Holden, Archie Neill, c/o Hardman and Holden, Ltd., Miles Platting, Manchester, Chemist.
1903. Holden, G. E., 23, Durnford Street, Middleton, near Manchester, Works Chemist.
1887. Holden, G. H., Manchester Oxide Co., Ltd., Canal Street, Miles Platting, Manchester, Chemist.
1904. Holden, Norman N., c/o Hardman and Holden, Ltd., Miles Platting, Manchester, Manufacturing Chemist.
1902. Holdsworth, Ernest T., Westholme, Great Horton, Bradford, Dyer.
1904. Holgate, Arthur, Rigby Street Mills, Liverpool, Corn Miller.

1885. Holgate, T. E., 173, Hollins Grove, Darwen, Lancashire, Metallurgist.
1884. Holgate, Thos., 5, Victoria Street, Westminster, S.W., Gas Engineer.
- O.M. Holland, Philip, 22, Taviton Street, Gordon Square, London, W.C., Analytical Chemist.
1892. Holland, Philip H., 958, Sherbrooke Street, Montreal, Canada, Merchant.
1901. Hollick, Herbert, c/o General Chemical Co., Camden, N.J., U.S.A., Works Manager.
1902. Holliday, Lionel B., Lunnclough Hall, Huddersfield, Chemical Manufacturer.
1896. Hollings, J. Spencer, Brynbo, North Wales, Works Manager.
1903. Hollinshead, Peter, New Field House, Wimboldsley, near Middlewich, Cheshire, Chemist.
1900. Hollinshead, W. H., Vanderbilt University, Nashville, Tenn., U.S.A., Teacher of Chemistry.
1904. Holloway, E. C., 447, Belle Plain Avenue, Chicago, Ill., U.S.A., Chemist.
1890. Holloway, G. T., 57-58, Chancery Lane, London, W.C., Analytical and Consulting Chemist.
1900. Holloway, Jno., 6, Highbury Grange, London, N., Mine Owner.
1883. Holmes, Ellwood, Wyncote, Jesmond Park East, Newcastle-on-Tyne, Colour Manufacturer.
- O.M. Holmes, F. G., Northcroft, Tewitwell Road, Harrogate, Yorks., Chemical Engineer.
1900. Holthouse, Harold B., 12, Melton Grove, West Bridgford, Nottingham, Chemist.
1902. Holton, Alf. L., Chemical Dept., Gas Works, Bradford Road, Manchester, Chemist.
1892. Holton, E. C., Sherwin-Williams Co., 100, Canal Street, Cleveland, Ohio, U.S.A., Chemist.
1893. Holzapfel, Max., Maritime Buildings, Quayside, Newcastle-on-Tyne, Manufacturer.
1893. Homfray, D., 6, Dartmouth Row, Greenwich, S.E., Analytical Chemist.
1904. Hooker, A. H., c/o Heath and Milligan Manufacturing Co., 170, Randolph Street, Chicago, Ill., U.S.A., Manufacturing Chemist.
- O.M. Hooper, E. Grant, Government Laboratory, Clement's Inn Passage, Strand, W.C.; and (Journals) 16, Royal Avenue, Sloane Square, S.W., Chemist.
1889. Hooper, Ernest F., Wear Fuel Works, Hendon Dock, Sunderland, Technical Chemist.
1888. Hope, Jas., Dean House, Lenzie, N.B., Nickel Works Manager.
1904. Hopewell, Fredk., 86, Youville Square, Montreal, Canada, Manager.
1892. Hopkins, Erastus, Lake Helen, Fla., U.S.A., Consulting Chemist.
1893. Hopkins, Gerald V., Nicholaston House, Penmaen, near Swansea, Metallurgist.
1894. Hopkins, Herbert W., (Journals) c/o Waihi G. M. Co., Waihi, Paeroa, N.Z.; and 13, Harrington Gardens, South Kensington, S.W., Metallurgist.
1905. Hoppenstedt, A. W., 138, Jerusalem Street, Brooklyn, N.Y., U.S.A., Chemist.
1898. Hopwood, Wm. H., Levenbank Cottage, Jamestown, Dumbartonshire, Printworks Chemist.
1895. Horne, Dr. W. D., Yonkers, N.Y., U.S.A., Consulting Chemist.
1904. Hornsey, J. W., 914, New England Building, Cleveland, Ohio, U.S.A., Chemical Engineer.
1900. Horsfall, Jno., 4, Grange Avenue, Rawtenstall, Manchester, Analytical and Consulting Chemist.
1902. Horsfall, L. H., c/o Binny and Co., Madras, India, Chemist.
1901. Horton, Edw., jun., 8, Orford Street, Chelsea, S.W., Student.
1889. Horton, William, 12, Princes Road, Liverpool, Analytical Chemist.
1902. Hosford, Roger F., 125, Milk Street, Boston, Mass., U.S.A., Chemical Engineer.
1890. Hoskins, A. Percy, Clonlee, Rosetta Park, Belfast, Ireland, Analytical Chemist.
1899. Hoskins, Wm., Room 55, 81, South Clark Street, Chicago, Ill., U.S.A., Chemist.
1899. Houlder, Bertram E., 50, Lady Margaret Road, Southall, Middlesex, Chemist.
1892. Houston, John, 26, Princess Street, Manchester, Drysalter.
1888. Houston, Robt. S., Brisbane House, Bellahouston, Glasgow, Analytical Chemist.
1891. Hovenden, Fred., Glenlea, Thunlow Park Road, West Dulwich, S.E.
- O.M. Howard, A. G., Burnt House, Clugwell, Essex, Chemical Manufacturer.
1901. Howard, Bernard F., Devon House, Buckhurst Hill, and (Journals) Lavender Mount Works, Hford, Essex, Chemist.
- O.M. Howard, D., Devon House, Buckhurst Hill, Essex, Chemical Manufacturer.
1887. Howard, D. Lloyd, City Mills, Stratford, E., Chemical Manufacturer.
1903. Howard, Fred. A., 254, Montello Street, Brockton, Mass., U.S.A., Chemist.
1898. Howard, Henry, 175, Mountford Street, Brookline, Mass., U.S.A., Chemical Engineer.
1902. Howard, Nelson A., c/o General Chemical Co., Hegewisch, Ill., U.S.A., Chemist.
1904. Howard, T., Hibernia House, Hibernia Road, Hounslow, Chemist.
- O.M. Howard, W. D., City Mills, Stratford, London, E., Chemical Manufacturer.
1903. Howe, Jas. Lewis, Washington and Lee University, Lexington, Va., U.S.A., Professor of Chemistry.
1904. Howell, Walter L., Appraiser's Office, Custom House, New Orleans, La., U.S.A., Chemist.
1899. Howles, Fred., c/o McDougall Bros., Millwall Docks, London, E., Chemist.
1899. Howorth, F. Wise, 46, Lincoln's Inn Fields, W.C., Technical Chemist and Chartered Patent Agent.
1896. Hoyte, Percy S., Gas Works, Coxside, Plymouth, Gas Engineer.
1900. Hübner, Julius, Ash Villa, Cheadle Hulme, Cheshire, Director of Dyeing and Papermaking Departments (Municipal School of Technology).
1898. Hudson, Albert W., c/o Yanapa Sin Iting Co., Bingham Canyon, Utah, Assayer.
1902. Hudson, C. Edward, c/o E. G. Jepson and Co., Albion Walk Chambers, Leeds, Drysalter.
1899. Hudson, Dr. Edw. J., c/o Pioneer Iron Co., Marquette, Mich., U.S.A., Chemist.
- O.M. Hughes, J., 79, Mark Lane, London, E.C., Agricultural Chemist.
1898. Hughes, Raymond M., Oxford, Butler Co., Ohio, U.S.A., Professor of Chemistry and Physics.
1904. Huillard, A., 7, Rue Salomon de Rothschild, Suresnes, Seine, France, Tannin Extract Manufacturer.
1903. Huilegard, H., c/o Orford Copper Co., New Brighton, N.Y., U.S.A., Chemical Engineer.
1900. Hulley, Geo. D., c/o J. Eaynson and Sons, 20th and Wood Streets, Philadelphia, Pa., U.S.A., Soapworks Chemist.
1893. Humfrey, Chas., Hilderstone, Hartford, Cheshire, Alkali Works Manager.
1903. Humphrey, John, 72, Great Russell Street, London, W.C., Editor ("Pharmaceutical Journal").
1902. Humphrey, Rich. L., 1001, Harrison Building, Philadelphia, Pa., U.S.A., Civil Engineer.
1903. Humphreys, A. C., 31, Nassau Street, New York City, U.S.A., Engineer.
- O.M. Humphrys, N. H., Gasworks, Salisbury, Wilts., Gas Engineer.
1895. Hunicke, Dr. H. Aug., 3532, Victor Street, St. Louis, Mo., U.S.A., Prof. of Applied Chemistry.
1900. Hunt, Arthur V., 76, Cronwell Street, Stretford, Lancashire, Analytical Chemist.
- O.M. Hunt, Bertram, Tres Amigos Mine, Pantarenas, Costa Rica, Technical Chemist.
- O.M. Hunt, Chas., 15, Victoria Street, Westminster, London, S.W., Gas Engineer.
1883. Hunt, J. S., Appleton, Widnes.
1903. Hunt, P. C. Holmes, Metropolitan Gas Co., Flinders Street, Melbourne, Vic., Australia, Gas Engineer.
- O.M. Hunt, W., Hampton House, Wood Green, Wadnesbury, Staffordshire, Chemical Manufacturer.

1897. Hunter, Prof. A. G. Kidston, (subs.) c/o A. G. Kidston and Co., 81, Great Clyde Street, Glasgow; and (Journals) P.O. Box 164, Dunedin, N.Z., Professor of Chemistry.
1903. Hunter, H. B., Denney Factory, St. Lucia, West Indies, Sugar Works Manager.
1902. Hunter, H. V. Blount, Hunter Chemical Co., Norfolk, Va., U.S.A., Industrial Chemist.
1893. Hunter, Prof. Matthew, Rangoon College, Rangoon, Burmah, Professor of Chemistry.
1892. Hunter, Sidney H., 202, Bow Road, London, E., Mechanical Engineer.
- O.M. Huntington, Prof. A. K., King's College, Strand, London, W.C., Professor of Metallurgy.
1902. Huntly, Geo. N., 96, Gower Street, London, W.C., Analytical and Consulting Chemist.
1902. Huntoon, Louis D., c/o Sheffield Scientific School, New Haven, Conn., U.S.A., Engineer.
1904. Huntzinger, Alfred, 3, Egerton Road, Chorlton-cum-Hardy, near Manchester, Chemist and Colourist.
1900. Hurd, Geo. E., 241, Hampden Court, Chicago, Ill., U.S.A., Food Products Manufacturer.
1903. Hurlburt, Allen S., c/o Thomsen Chemical Co., Baltimore, Md., U.S.A., Chemist.
1904. Hurren, F. H., 43, Northumberland Road, Coventry, Analytical Chemist.
1894. Hurry, E. H., Goodwyns, Haslemere, Surrey, Mechanical Engineer.
1884. Hurst, G. H., 22, Blackfriars Street, Salford, Manchester, Analytical Chemist.
1901. Hurty, Jno. N., Cor. Penn and Ohio Streets, Indianapolis, Ind., U.S.A., Analytical Chemist.
- O.M. Huskisson, P. L., 77, Swinton Street, London, W.C., Chemical Manufacturer.
- O.M. Huson, C. W., 18, Batavia Buildings, Hackins Hey, Liverpool, Analytical Chemist.
1894. Hutcheson, Jno. F., 22, St. Enoch Square, Glasgow, Chemical Manufacturer.
- O.M. Hutchinson, C. C., 3, Harcourt Buildings, Temple, E.C., Barrister-at-Law and Chemical Engineer.
1900. Hutchinson, Edw. G., Gas Offices, Pontefract Road, Barnsley, Yorks., Assistant at Gasworks.
- O.M. Hutchinson, T. J., Aden House, Manchester Road, Bury, Analytical and Consulting Chemist.
1901. Hutton, Robt. S., The University, Manchester, Lecturer on Electro-Chemistry.
- O.M. Huxley, Jas. H., c/o Vickers, Son and Maxim, Ltd., River Don Works, Sheffield, Metallurgical Chemist.
1897. Hyams, Geoffrey M., P. O. Box 5104, and 312, Sears Building, Boston, Mass., U.S.A., Mines Manager.
1902. Hyde, Austin T., Box 365, Rumford Falls, Maine, U.S.A., Chemical Engineer.
1897. Hyde, B. T., Babbitt, c/o B. T. Babbitt, 82, Washington Street, New York City, U.S.A., Soap Manufacturer.
1899. Hyde, Fred. S., 215, Schermerhorn Street, Brooklyn, N.Y., U.S.A., Research Chemist.
1897. Hyde, Henry St. John, 210, East 18th Street, New York City, U.S.A.
1899. Hyde, Wm. Grantley, 26, Winsham Grove, Clapham Common, S.W., Assayer.
1901. Hyman, Leonard W., 342, South Pearl Street, Albany, N.Y., U.S.A., Analytical Chemist.
1896. Hyndman, H. H., Francis, 27, Pembroke Square, Kensington, W., Consulting Chemist.
1902. Ihart, John P., 427, West 38th Street, New York City, U.S.A., Technical Chemist.
1900. Inrie, John, 415, Shields Road, Pollokshields, Glasgow, Analytical Chemist.
1900. Ingalls, Walter R., 52, Broadway, New York City, U.S.A., Mining Engineer and Metallurgist.
1889. Ingle, Dr. Harry, 15, John Street, Kirkcaldy, Fifeshire, Organic Chemist.
1891. Ingle, Herbert, Dept. of Agriculture, Government Buildings, Pretoria, Transvaal, Chemist.
1884. Inglis, R. A., Culrain, Bothwell, N.B., Analytical Chemist.
1904. Irlam, H. A., 34, East Street, Faversham, Kent, Chemist.
1884. Irving, J. M., 17a, Dickinson Street, Cooper Street, Manchester, Chemical Merchant.
- O.M. Irwin, W., Inglehurst, Stand, near Manchester, Analytical Chemist.
1893. Isaac, J. F. V., Research Chemist.
1888. Isaac, T. W. Player, Barton Court, Abingdon, Chairman of Waterworks Co.
1896. Isaacs, Louis A., 110, Greencroft Gardens, West Hampstead, N.W., (Journals) c/o Yeatman and Co., Ltd., Denmark Street, E., Manufacturer.
1901. Isakovics, Alois von, Monticello, N.Y., U.S.A., Manufacturing Chemist.
- O.M. Isler, Otto, 35-37, Dickinson Street, Manchester, Chemical Merchant.
1900. Ittner, Dr. Martin H., c/o Colgate and Co., Jersey City, N.J., U.S.A., Soap and Essential Oil Chemist.
- J
1890. Jackman, E. J., 60, Belgrave Road, Ilford, Essex, Technical Chemist.
1898. Jackson, Alf. Greville, George Street, Brisbane, Queensland, Electro-Chemical Engineer.
1901. Jackson, Daniel D., Mount Prospect Laboratory, Flatbush Avenue and Eastern Parkway, Brooklyn, N.Y., U.S.A., Chemist.
1903. Jackson, D. H., 47, Mecklenburgh Square, London, W.C., Chemist.
- O.M. Jackson, Edward, Ravens Clift, Oxford Road, Moseley, Birmingham, Alkali Works Inspector.
1904. Jackson, Ernest W., 11, Queen's Terrace, Middlesbro, Analytical Chemist.
1891. Jackson, F., Smedley Bridge Works, Cheetham, near Manchester, Bleacher and Dyer.
1883. Jackson, Frederick, 14, Cross Street, Manchester, Laboratory Furnisher.
1901. Jackson, Henry A., 1191, Washington Street, Wilmington, Del., and Columbia University, New York City, U.S.A., Chemist.
1886. Jackson, John, 98, Dobbie's Loan, Glasgow, Lubricant Manufacturer.
1901. Jackson, Percy G., Chemical Laboratory, Locomotive Dept., Midland Railway, Derby, Chemist.
- O.M. Jackson, R. V., c/o Scotch and Irish Oxygen Co., Polmadie, Glasgow, Technical Chemist.
1890. Jackson, Saml., c/o Binny and Co., Madras, India, Analytical Chemist.
1902. Jackson, Samuel, c/o Wm. Metcalf, Ltd., Church, near Accrington, Director (Tar Distillery).
1898. Jackson, Thos., Clayton Chemical Works, Clayton, Manchester, Chemical Manufacturer.
1900. Jackson, Victor G., 167, Grove Lane, Denmark Hill, S.E., Chemist.
1901. Jackson, W. B., Glengowan Printworks, Caldercruix, N.B., Chemist.
1903. Jackson, Wm. D. N., 78, North Road, Wallsend-on-Tyne, Analytical Chemist.
1900. Jackson, Dr. W. Hatchett, Radcliffe Library, Oxford, Librarian and Science Tutor (Keble College).
1903. Jackson, W. H., 50 and 52, North Front Street, Philadelphia, Pa., U.S.A., Chemist and Importer.
1893. Jackson, Rt. Hon. W. L., F.R.S. See Allerton, Rt. Hon. Lord.
- I
1898. Ibbotson, E. C., 3, Ashgate Road, Sheffield, Metallurgist.
1900. Ichioka, Dr. Tajiro, 19, Maruyama Shinmachi, Hongo, Tokio, Japan, Chemist (Imperial Japanese Navy).
1885. Idris, T. H. W., 110, Pratt Street, Camden Town, N.W., Mineral Water Manufacturer.

1899. Jackson, W. Morton, c/o Manchester Oxygen Co., Ltd., Great Marlborough Street, Manchester, Manager.
- O.M. Jackson, W. P., Saxilby, near Lincoln, Chemical Works Manager.
1901. Jacobs, Charles B., c/o American Lithographic Co., 19th Street and 4th Avenue, New York City, U.S.A., Chemist.
1901. Jacobsen, Rudolph C., 154, Lake Street, Chicago, Ill., U.S.A., Editor of "Hide and Leather."
1900. Jacoby, Arch H., c/o American Dyewood Co., 156, William Street, New York City, U.S.A., Chemist.
1897. Jacqué, Maurice, "La Cantabrica," Galdacano, cerca Bilbao, Spain, Chemical Engineer.
1901. Jadhava, Khasberao B., Nansori, Bombay, India, Collector and District Magistrate.
1900. Jäger, B. M., c/o Geo. Jäger and Sons, 77, Burlington Street, Liverpool, Sugar Chemist.
1886. Jago, Wm., Godfrey House, Wilbury Avenue, Hove, Sussex, Chemical Engineer.
1889. James, Alf., 2, Broad Street Place, London, E.C., Mining Engineer.
1883. James, E. T., British Alizarin Co., Ltd., Silvertown, Victoria Docks, E., Secretary.
1885. James, Dr. J. Wm., Aylmer House, Weston-super-Mare; and (Journals) 29, Redcliff Street, Bristol, Chemical Lecturer.
1893. James, Lawrence S., 32, Hawley Street, Boston, Mass., U.S.A., Gas Inspector.
1905. James, Oscar S., 227, George Street, Toronto, Canada, Analytical Chemist.
1902. Jameson, Lewis, 83, Queen Victoria Street, London, E.C., Consulting Chemist.
1903. Janes, Frank W., Wolseley Street, Surrey Hills, Victoria, Australia, Assayer.
1890. Jantzen, Paul, 133, Fenchurch Street, London, E.C., Chemical Merchant.
- O.M. Japp, Dr. F. R., F.R.S., The University, Aberdeen, Professor of Chemistry.
1890. Jarman, Geo. S., Hazel Grove, Edgerton, Huddersfield, Wool Extractor.
- O.M. Jarmay, G., Hartford Lodge, Hartford, Cheshire, Alkali Manufacturer.
1884. Jarves, Deming, Michigan Carbon Works, Detroit, Mich., U.S.A., Manufacturing Chemist.
1900. Jarvie, Jas., Monkland House, Kirkintilloch, N.B., Chemist.
- O.M. Jayne, Dr. H. W., 931, North Broad Street, Philadelphia, Pa., U.S.A., Manufacturing Chemist.
- O.M. Jekyll, J., Castle Moat House, Lincoln, Chemical Manufacturer.
1892. Jenkin, W. A., 5, Bella Vista, Minas de Rio Tinto, Provincia de Huelva, Spain, Metallurgical Chemist.
1894. Jenkins, John H. B., Laboratory, G.E.R. Works, Stratford, E., Analytical Chemist.
1894. Jenks, Robt. L., 89, Bartholomew Close, London, E.C., Chemist.
- O.M. Jenner, E., 209, Markhouse Road, Walthamstow, Essex, Chemical Manufacturer.
1903. Jennings, Henry, 42, Marlowes, Hemel Hempstead, Herts, Analyst.
1899. Jennings, Thos., Brookfield, Cork, Ireland, Chemical Manufacturer.
1904. Jepson, John Elliott, The Star Paper Mill Co., Ltd., Feniscowles, near Blackburn, Chemist.
1899. Jerdan, Dr. David S., c/o J. and G. Cox, Ltd., Gorgie Mills, Edinburgh, Chemist (Gelatin Works).
1899. Jessop, Louis V., Holmlea, Woodville Road, Leytonstone, Essex, Chemist.
1904. Jessup, Alfred E., c/o U.S. Consul, Tientsin, China, Assayer.
1904. Jewell, Wm. M., Cable Building, Chicago, Ill., U.S.A., Chemist and Engineer.
1904. Jewson, F. T., Thornly Park Terrace, Paisley, N.B., Chemist.
1896. Job, Robt., 109, Windsor Street, Reading, Pa., U.S.A., Analytical Chemist.
1886. Johnson, A. E., Claremont, Lyndhurst Road, Wolverhampton, Analytical Chemist.
1904. Johnson, Cedric, Field House, Wilmington, Northwich, Chemical Engineer.
1902. Johnson, Chas. M., 701, Orchard Street, Avdon, Allegheny Co., Pa., U.S.A., Chemist.
1891. Johnson, Edmund E., Carlton Harold Wood, Essex, Chemical Engineer.
1900. Johnson, Edw., c/o Pereira, Cimento and Co., Rua do Commercio No. 6, Petropolis, Brazil, Sugar Works Manager.
1902. Johnson, Emil F., 96-98, Marden Lane, New York City, U.S.A., Consulting Chemist.
1900. Johnson, E. Carter, National Acid Co., 714, Union Street, New Orleans, La., U.S.A., Chemical Engineer.
1904. Johnson, F. M. G., 286, Peel Street, Montreal, Canada, Chemist.
1904. Johnson, G. B., 7, Church Street, Liverpool, Wholesale Chemist.
1903. Johnson, Horace, Waialua, Oahu, Hawaii, Chemist.
- O.M. Johnson, J. E., 40, Edmiston Road, Stratford, E., Manufacturing Chemist.
1884. Johnson, J. Grove, 23, Cross Street, Finsbury, E.C., Assayer.
1895. Johnson, Jesse F., 58, Metcalfe Street, Montreal, Canada, Chemical Engineer.
1900. Johnson, John, c/o John Johnson and Co., Franklin Square, New York City, U.S.A., Chemical Engineer.
1900. Johnson, Jno. W. H., York House, Thornhill, Dewsbury, and (Journals) West Riding Rivers Board, Wakefield, Yorks., Chemist.
- O.M. Johnson, S. H., Warren Hill House, Loughton, Essex, Chemical Engineer.
1904. Johnson, S. Heaton, 7, Church Street, Liverpool, Wholesale Chemist.
1899. Johnson, Saml. H., jun., Hempstead House, Woodford Wells, Essex, Chemical Engineer.
- O.M. Johnson, T. A., Field House, Wilmington Park, Northwich, Cheshire.
1903. Johnson, Thos., Caixa 94, Pernambuco, Brazil, Manager.
1895. Johnston, Alex. R., 18, Percy Street, Ibrox, Glasgow, Analytical Chemist.
1894. Johnston, G. Lawson, *See* Lawson-Johnston, G.
1904. Johnston, J. H., 8, Leopold Road, Wimbledon, S.W., Chemist and Bacteriologist.
1889. Johnston, Thos., Nobel's Explosives Co., Ltd., 195, West George Street, Glasgow, Manager.
1904. Johnston, Thos. J., 4, Garrioch Drive, Kelvinside North, Glasgow, Chemist.
1890. Johnston, Wm. A., The S. S. White Dental Manufacturing Co., Prince's Bay, Staten Island, N.Y., U.S.A., Dental Enamel Manufacturer.
1894. Johnston, W. E. Lawson, *See* Lawson-Johnston, W. E.
- O.M. Johnston, Wm. G., Anchor Chemical Works, 1095, Garnad Road, Glasgow, Technical Chemist.
- O.M. Johnstone, Jas., Shawfield Works, Rutherglen, Glasgow, Technical Chemist.
1903. Johnstone, S. J., 15, Springfield Road, New Southgate, N., Research Chemist.
- O.M. Johnstone, W. G., The Brewery, Newark-on-Trent, Chemist.
1902. Jollyman, Walter H., Government Laboratory, P.O. Box 1089, Johannesburg, Transvaal.
1903. Jones, Alfred O., c/o Carr and Co., Caldwate, Carlisle, Works Chemist.
1904. Jones, Arthur B., c/o General Chemical Co., Station F, Box 12; and (Journals) 452, Russell Avenue, Cleveland, Ohio, U.S.A., Superintendent.
1897. Jones, Chas. H., El Cobre Mines, Santiago de Cuba, Cuba, Technical Chemist.
1902. Jones, David R., Standard Chemical Co., Deseronto, Ont., Canada, Chemical Engineer.
1902. Jones, E. Strangways, Sulphide Corporation, Ltd., Cockle Creek, N.S.W., Australia, Metallurgical Chemist.
- O.M. Jones, E. W. T., 10, Victoria Street, Wolverhampton, Analytical Chemist.
1897. Jones, Fred. W., 96, Downs Park Road, Clapton, N.E., Explosives Works Manager and Chemist.

1896. Jones, G. Cecil, Stour Villa, Mistley, Essex, Brewer's Chemist.
1904. Jones, Geo. E., c/o De Beers P.O. Explosive Works, Somerset W., Cape Colony, Technical Chemist.
1903. Jones, G. Robert, Gas Works, Caixa 147, Pernambuco, Brazil, Gas Engineer.
1898. Jones, Henry, Broughton Bridge Mills, Salford, Dyer and Finisher.
- O.M. Jones, H. Chapman, Royal College of Science, South Kensington, S.W., Senior Demonstrator in Chemistry.
1893. Jones, Herbert, *See* Sefton-Jones, H.
1901. Jones, Herbert J., c/o The Scottish Acid and Alkali Co., Ltd., Kilwinning, N.B., Chemist.
1904. Jones, J. Shirley, c/o Giant Powder Co., Giant, Contra Costa Co., Cal., U.S.A., Chemist.
1899. Jones, Llewellyn J. W., Tacoma Smelting Co., Tacoma, Washington, U.S.A., Metallurgist.
1898. Jones, Martin L., c/o Oregum G. M. Co., Oorgaum, Mysore State, India, Metallurgical Chemist.
1894. Jones, M. W., Greystonedale, Kensington Hill, Bristol, Manager (Oil and Colour Works).
1887. Jones, T. Tolley, Australian Explosives and Chemical Co., Ltd., 138, Queen Street, Melbourne, Victoria, Australia, Explosives Manufacturer.
1903. Jones, Wm. App., c/o Boston Artificial Leather Co., Stamford, Conn., U.S.A., Chemist.
- O.M. Jones, W. Norris, Lancashire Metal Works, Widnes, Technical Chemist.
1902. Jonker Czn., Hendrik, Hotel Europaischer Hof, Hagenau, Elsass, Germany, Chemical Engineer.
1899. Joplin, Geo. C., Brierbank, Albert Road, Strathfield, Sydney, N.S.W., Australia, Analyst.
1904. Jordan, Stanley, 100, William Street, New York City, U.S.A., Importer of Chemicals.
1897. Jorissen, Dr. Wm. P., Koninklijk Inst. v. d. Marine, Willemsoord, Holland, Editor.
1900. Josephson, Edgar, 131, Amity Street, Brooklyn, N.Y., U.S.A.
1891. Joslin, Omar T., 3223, Spring Grove Avenue, Cincinnati, Ohio, U.S.A., Chemical Engineer.
1887. Joliet, Dr. C. H., Roselle, Union Co., N.J., U.S.A., Technical Chemist.
1889. Journaud, Louis, 21, Grand Rue, Bourg-de-Péage, Drôme, France, Technical Chemist.
1904. Jowett, Dr. H. A. D., Wansfell, Church Avenue, Sidcup, Kent, Chemist.
1888. Joy, Douglas G., The Rookery, Stevenage, Herts., Oil Refiner.
1904. Joy, Dr. J. Holmes, Manor House, Tamworth, Staffordshire, Physician.
1903. Joyce, Clarence M., c/o Arlington Co., Arlington, N.J., U.S.A., Chemist.
1887. Jürgensen, Dr. Rolo, Karlsgasse 5, Prag-Zizkov, Austria, Chemist.
1900. Just, Jno. A., Jefferson Avenue and Delano Street, Pulaski, Oswego Co., N.Y., U.S.A., Chemist.
- O.M. Justice, P. M., 55-56, Chancery Lane, London, W.C., Patent Agent.
1903. Kauffman, Milton H., American Smelting and Refining Co., Durango, Colo., U.S.A., Chemist.
1892. Kaufmann, Dr. Herbert M., c/o Mutual Chemical Co., Jersey City, N.J., U.S.A., Chemist.
1904. Kaus, Dr. Emil, c/o Roessler and Hasslacher Chemical Co., Perth, Amboy, N.J., U.S.A., Chemist.
1904. Kawai, I., Camphor Monopoly Bureau, Fukuoka, Japan, Chemist.
1885. Kawakita, Prof. Michitada, Imperial Engineering College, Tokio, Japan, Professor of Applied Chemistry.
- O.M. Kay, Wm., E., Marple Lodge, Marple, Cheshire, Printworks Chemist.
1904. Kaye, Thos., Westerfield, Perth, Scotland, Analytical Chemist.
- O.M. Kearns, H. W., Baxenden House, near Accrington, Dyer.
1897. Kearns, Jno. S., Baxenden House, near Accrington, Chemist and Dyer.
1894. Kebler, Lyman F., Department of Agriculture, Bureau of Chemistry, Washington, D.C., U.S.A., Chief of Drug Laboratory.
1904. Keddell, H. Hewes, 2, Lime Street Square, London, E.C., Merchant.
1886. Keiser, Prof. E. H., Washington University, St. Louis, Mo., U.S.A., Professor of Chemistry.
1900. Kelf, Henry C., The Millaquin and Yengarie Sugar Co., Millaquin, Bundaberg, Queensland, Australia, Sugar Chemist.
1900. Kellner, Dr. Carl, (Journals) Laby., Borschkegasse No. 8, Vienna, IX 2; and (subscriptions) Hohe Warte No. 29, Vienna XIX., Austria, Paper Chemist.
1885. Kellner, Dr. Wm., 135, Victoria Road, Old Charlton, S.E., Chemist to War Department.
1889. Kempson, John F., Pye Bridge Chemical Works, near Altreton, Derbyshire, Chemical Manufacturer.
1901. Kennedy, Alex., Kenmill House, Bothwell, N.B., Rosin Distiller.
1903. Kennedy, Hugh Watson, 626, South 19th Street, Philadelphia, Pa., U.S.A., Chemist.
1904. Kenney, Fredk. J., 493, Lexington Avenue, New York City, U.S.A., Chemist.
1901. Kenrick, Dr. Frank B., 209, John Street, Toronto, Canada, Lecturer on Chemistry.
1903. Kenyon, Percy S., 15, Rook Street, Manchester; and (Journals) Park House, Cheadle Hulme, Cheshire, Drysalter.
1889. Kenyon, Thos., The Shrubbery, Hilton Park, Prestwich, near Manchester, Manufacturing Chemist.
1900. Keppelmann, Alf. J., P.O. Box 1549, Philadelphia, Pa., U.S.A., Chemical Merchant.
1888. Ker, Alan D., Milburn Chemical Works, Garngad Hill, Glasgow, Chemical Manufacturer.
1899. Kern, Walter P., 262, Paulison Avenue, and (Journals) c/o General Chemical Co., Dundee Works, Passaic, N.J., U.S.A., Chemist.
1894. Kerr, Jas., Surgeons Hall, Edinburgh, Lecturer on Chemistry.
1890. Kerr, Saml. T., 516, North Delaware Avenue, Philadelphia, Pa., U.S.A., Salt Manufacturer.
1897. Kerr, Wm. M., c/o General Chemical Co., 608, Philadelphia Bourse, Philadelphia, Pa., U.S.A., Manufacturing Chemist.
1896. Kershaw, Jno. B. C., West Lancashire Laboratory, Waterloo, Liverpool, Analytical Chemist.
1902. Kessler, Henry W., Brandt, Susquehanna Co., Pa., U.S.A., Manufacturing Chemist.
1903. Kessler, R., jun., The Nordmont Chemical Co., Nordmont, Pa., U.S.A., Chemical Manager.
1893. Kestner, Paul, 5, Rue de Toul, Lille, France, Chemist.
1898. Keswick, Wm., M.P., 3, Lombard Street, London, E.C., Merchant.
1900. Kewley, Jas., Arbory Road, Castletown, Isle of Man, Technical Chemist.
1890. Keys, W. H., Lyndon House, West Bromwich, Oil and Chemical Manufacturer.

K

1898. Kahn, Julius, 160, West 80th Street, New York City, U.S.A., Manufacturer of Rubber Goods.
1896. Kalbfleisch, Franklin H., 33-35, Burling Slip, New York City, U.S.A., Chemical Manufacturer.
1884. Kalle, Dr. Wm., Biebrich-am-Rhein, Germany, Colour Manufacturer.
1904. Kane, Richard W. H., 88, Kimmersitch Street, Burton-on-Trent, Mechanical Engineer.
1899. Karas, Jno., c/o Buffalo Shirt Co., 565-577, Washington Street, Buffalo, N.Y., U.S.A., Laundryman.
1901. Kasson, Henry R., 1209, Stock Exchange Building, Chicago, Ill., U.S.A., Asphalt Chemist.
1905. Katzenbach, Welling S., 120, East 31st Street, New York City, U.S.A., Chemist.
1901. Kander, Dr. E., c/o Merck and Co., Rahway, N.J., U.S.A., Chemist.

1892. Kibble, W. Oakes, Charlotte, N.C., U.S.A., Chemical Engineer.
1896. Kier, Thos., Thornliebank, Glasgow, Chemist.
1900. Kilgore, Benj. W., Raleigh, N.C., U.S.A., Chemist.
1901. Kilmer, Fred. B., New Brunswick, N.J., U.S.A., Chemical Manufacturer.
- O.M. Kinch, E., Royal Agricultural College, Cirencester, Professor of Chemistry.
- O.M. King, A. J., (Journals) Ingersley Vale, and (communications) Rock Bank, Bollington, near Macclesfield, Bleacher and Finisher.
1884. King, C. M., Campsie Alum Works, Lennoxtown, N.B., Alum Manufacturer.
- O.M. King, J. Falconer, 20, Chambers Street, Edinburgh Consulting Chemist.
1897. King, Joshua, Clarendon, Camberley, Surrey, Indian Civil Service (retired).
1887. King, Robt., 115, Wellington Street, Glasgow, Chemical Manufacturer.
1895. King, Sidney J., 1, Russell Villas, Pope's Grove, Strawberry Hill, Middlesex, Colour and Dyestuff Traveller.
- O.M. King, Walter R., 16, Mincing Lane, London, E.C., and (Journals) Avalon, Trinity Avenue, Southend-on-Sea, Chemical Manufacturer.
1903. King, William, c/o Natal Estates, Ltd., South Coast Junction, Natal, S. Africa, Analytical Chemist.
1899. King, Wm. R., 17, Fernwood Road, Summit, N.J., U.S.A., Mechanical Engineer.
1896. Kingdon, Holman, 25, Grappenhall Road, Stockton Heath, Warrington, Technical Chemist.
1883. Kingsford, T. P., Oswego, N.Y., U.S.A., Starch Manufacturer.
- O.M. Kingzett, C. T., Elmstead Knoll, Chislehurst, Kent, Technical Chemist.
1892. Kinnicutt, Professor L. P., 77, Elm Street, Worcester, Mass., U.S.A., Professor of Chemistry (Worcester Polytechnic Institute).
1897. Kipping, Dr. F. Stanley, F.R.S., University College, Nottingham, Prof. of Chemistry.
1898. Kirkland, Archd., 78, High Street, Irvine, N.B., Baker.
1905. Kirkland, John, 8, Corrance Road, Brixton, S.W., Technical Instructor.
1897. Kirkland, Robt., 7, Ross Street, Mill Road, Cambridge, Chemist.
1900. Kirkpatrick, Stafford F., 96, Barrie Street, Kingston, Ont., Canada, Assayer.
1887. Kitamura, Y., c/o R. Fujihanaya, Yokoyama-cho Sanchome, Tokyo, Japan, Agricultural Chemist.
1902. Kitchen, Wm. J., Port Melbourne North, Vic., Australia, Soap and Candle Manufacturer.
1891. Kitson, Sir James, Bart., M.P., Gledhow Hall; and (Journals) Monkbridge Iron and Steel Co., Ltd., Leeds, Iron and Steel Manufacturer.
1883. Kitto, B., 26, Lancaster Road, Finsbury Park, London, N., Analytical Chemist.
1900. Kittredge, H. G., 42, Linden Avenue, Dayton, Ohio, U.S.A., Chemist.
1900. Kleber, Dr. Clemens, Union Avenue, Clifton, N.J., U.S.A., Director (Fritzsche Bros.' Laboratory).
1888. Kleemann, Dr. S., Farben Fabrik, Forchheim, Bavaria, Analytical Chemist.
1898. Klein, Otto H., Room 110, 280, Broadway, New York City, U.S.A., Consulting Engineer.
1903. Kline, Clarence M., c/o Smith, Kline, and French Co., Canal and Poplar Streets, Philadelphia, Pa., U.S.A., Wholesale Druggist.
1889. Klipstein, A., 122, Pearl Street, New York City, U.S.A., Chemical Manufacturer.
1902. Klipstein, Ernest C., 116, Prospect Street, East Orange, N.J., U.S.A., Chemical Manufacturer.
1891. Knaggs, Alfred B., Bradley Lane, Huddersfield, Technical Chemist in Dye-works.
1900. Knapp, Rudolf E., 1219, 8th Street, Evansville, Ind., U.S.A., Chemist.
1905. Knapp, Sewell A., Tonopah, Nevada, U.S.A., Mine Manager.
1892. Knecht, Dr. E., Municipal School of Technology, Manchester, and (Journals) Station Road, Crumpsall, Manchester, Professor of Industrial Chemistry.
1904. Kniffen, Frederick, Indian Head, Md., U.S.A., Chemist.
1887. Knight, A. H., 2, Gerald Road, Oxtou, Cheshire, Assayer.
1903. Knight, Huley F., 64, Ambart Park, Stamford Hill, N., Analyst.
1884. Knight, Henry, Stanley House, 73, Anfield Road, Liverpool, Colour and Varnish Manufacturer.
- O.M. Knight, J. B., Silvertown Soapwork, Silvertown, London, E., Soap Manufacturer.
1887. Knights, J. West, Public Laboratory, Tenison Road, Cambridge, Analytical Chemist.
1885. Knipfer, F., c/o R. Harper and Co., Port Melbourne, Victoria, Australia, Starch Manufacturer.
1883. Knowles, Joshua, Stormer Hill, Tottington, near Bury, Calico Printer.
1904. Knowles, W. R., The Hollies, Wood Green, Wexnessbury, Chemical Works Manager.
1886. Knox, E. W., Colonial Sugar Refining Co., Sydney, N.S.W.; and c/o Parbury, Henty and Co., 20, Eastcheap, London, E.C., Sugar Manufacturer and Refiner.
1902. Knudsen, Hans, 29A, Gillingham Street, London, S.W., Inventor.
1904. Koch, J. A., Bluff and Pride Streets, Pittsburg, Pa., U.S.A., Chemist.
1903. Koch, Walter E., c/o Lustre Mining Co., Sta. Maria del Oro, *via* Parral, Esc. Durango, Mexico, Metallurgical and Mining Engineer.
1904. Koebig, Dr. J., 127, West First Street, Los Angeles, Cal., U.S.A., Chemical Engineer.
1895. Koehl, Victor, P.O. Box 159, New York City, U.S.A., Dye Merchant.
1901. Koehler, Dr. H., c/o Roessler and Hasslacher Chemical Co., Perth Amboy, N.J., U.S.A., Manager.
1904. Koerner, H. Theo., Beyerstrasse 28, Chemnitz, Germany, Student of Chemistry.
1884. Kohn, Dr. Charles A., M.Sc., Sir John Cass Technical Institute, Jewry Street, Aldgate, E.C., Principal.
1902. Kohnstamm, Lothair S., 87, Park Place, New York City, U.S.A., Chemist.
1904. Korte, Dr. R. F., 146, Alexandra Road, N.W.; and (Journals) University College, Gower Street, London, W.C., Chemist.
1902. Kottmann, Dr. Gustav, Colonial Sugar Refining Co., Ltd., O'Connell Street, Sydney, N.S.W., Australia, Analytical Chemist.
- O.M. Kraftmeier, E., 54, Parliament Street, Westminster, S.W., Explosives Manufacturer.
1894. Krause, Dr. Albert H., 32, Wellington Avenue, Cleveland, Ohio, U.S.A., Chemist (Grasselli Chemical Co.).
- O.M. Krause, Prof. Dr. G., "Chemiker-Zeitung," Cöthen, Germany, Editor.
- O.M. Krause, O. H., c/o American Sugar Refining Co., Jersey City, N.J., U.S.A., Chemical Engineer.
1898. Krebs, H. J., Wilmington, Del., U.S.A., Manufacturing Chemist.
1903. Kremer, Frank N., 646, Broadway, Milwaukee, Wis., U.S.A., Chemist.
1900. Kremers, Dr. Edw., Madison, Wis., U.S.A., Professor (University of Wisconsin).
1904. Kübler, Alfred, 69, Barclay Street, New York City, U.S.A., Vice-President, Geigy Aniline and Extract Co.
- O.M. Kühl, W. H., 73, Jägerstrasse, Berlin, Germany, Bookseller.
1900. Kuhnheim, Dr. Erich, 32, Dorotheenstrasse, Berlin, N.W., Germany, Chemist.
1904. Kunz, Dr. George F., c/o Tiffany and Co., 11-15, Union Square, New York City, U.S.A., Gem Expert.
1885. Kupferberg, Dr. H., 19, Schulstrasse, Mainz, Germany, Technical Chemist.
1896. Kuttroff, Adolf, 128, Duane Street, New York City, U.S.A., Chemical Merchant.

1900. Kuttroff, Fred., 128, Duane Street, New York City, U.S.A., Merchant.
1904. Kyle, J., Canada Paint Co., Ltd., 572, William Street, Montreal, Canada, Analytical Chemist.
- O.M. Kynaston, J. W., 3, Oak Terrace, Beech Street, Liverpool, Chemical Engineer.
- L**
1897. Labonde, Dr. Leon, P.O. Box 594, Rochester, N.Y., U.S.A., Consulting Chemical Engineer.
1890. Lacey, E. C., 10, Clarence Road, Croydon, Manufacturing Chemist.
1899. Lachman, Albert, California Wine Association, San Francisco, Cal., U.S.A., Wine Merchant.
1903. Lachman, Dr. Arthur, 131, Second Street, San Francisco, Cal., U.S.A., Chemical Engineer.
1888. Lagerwall, Dr. Ivar, Sunthorpe, Wallington, Surrey, Petroleum Manufacturer.
- O.M. Laidler, C. P., 20, Noble Terrace, Gateshead-on-Tyne, Analytical Chemist.
- O.M. Lake, G. jun., Lee Mount, Glossop, Derbyshire, Analytical Chemist.
1900. Lamar, Wm. R., Mallinckrodt Chemical Works, St. Louis, Mo., U.S.A., Chemist.
1898. Lamb, Morris Chas., 151, Westcombe Hill, Blackheath, S.E., Chemist.
1900. Lambert, Walter S., Vandre Road, Clydach, R.S.O., Glamorgan, Analyst.
1899. Lamborn, Leebert Lloyd, 134, Willoughby Avenue, Brooklyn, N.Y., U.S.A., Factory Superintendent.
1895. Lancaster, Jno. C., 260, Alferton Road, Nottingham, Engineering Works Manager.
1904. Lancey, Darragh de, Great Barrington, Mass., U.S.A., Secretary (Stanley Instrument Co.).
1895. Landin, John, 40, Drottninggatan, Stockholm, Sweden, Public Analyst.
1904. Lane, C. Cyril P., c/o The Avon India-Rubber Co., Melksham, Wilts., Chemist.
1903. Lane, Nathaniel J., U.S. Laboratory, 641, Washington Street, New York City, U.S.A., Chemist.
1890. Lang, Jas. G., P.O. Box 283, Greenwood, B.C., Canada, Analytical Chemist.
1893. Lang, Dr. Wm. R., University of Toronto, Canada, Professor of Chemistry.
- O.M. Langdon, Dr. M. J., 64, Northern Grove, West Didsbury, Manchester, Analytical Chemist.
1890. Lange, Dr. Martin, 66, Grafton Street, C. on M., Manchester, Analytical Chemist.
1892. Langer, Dr. Carl, Ynyspenllwch, Clydach, R.S.O., Glamorganshire, Analytical Chemist.
1897. Langmuir, Arthur C., c/o Marx and Rawolle, 9, Van Brunt Street, Brooklyn, N.Y., U.S.A., Analytical Chemist.
1902. Langmuir, F. Leighton, 22, Goethestrasse, Freiburg, i. B. Germany, Chemist.
1898. Langstaff, Wm., c/o Grasselli Chemical Co., Tremley, N.J., U.S.A., Chemist.
1900. Lant, Herbert, "Ivy Bank," Wath-on-Dearne, near Rotherham, Yorks., Chemist and Manager.
1903. Larter, Alfred T., The Basingstoke Ironworks, Basingstoke, Hants, Chemist.
1904. Lasher, F. G., The Lake Pigment Co., Dunellen, N.J., U.S.A., Chemist.
1884. Latham, Baldwin, Parliament Mansions, Victoria Street, Westminster, S.W., Civil Engineer.
1889. Latham, J. J., Mill House, Bold, Widnes, Chemical Works Manager.
1904. Laury, N. Arthur, Capelton, Prov. Quebec, Canada, Chemist.
1904. Law, Herbert, 72, Belvedere Road, Liscard, Cheshire, Analytical Chemist.
- O.M. Lawrence, Jas., Box 737, Joplin, Mo., U.S.A., Explosives Manufacturer.
- O.M. Laws, J. P., 2, Aigburth Vale, Liverpool, S., Analytical Chemist.
1885. Lawson, Arthur J., Marsh Soapworks, Bristol, Soap Manufacturer.
1904. Lawson, Jos. H. S., Worsley Street, Mills, Hulme, Manchester, Salesman.
1900. Lawson, Wm., c/o Utah Sugar Co., Salt Lake City, Utah, U.S.A., Chemist.
1894. Lawson-Johnston, G., (Journals) 29, Portman Square, W., and c/o Bovril, Ltd., 152, Old Street, London, E.C., Vice-Chairman.
1894. Lawson-Johnston, W. E., c/o Bovril, Ltd., 152, Old Street, London, E.C., Director.
1893. Lawton, Thos., Calthorpe House, Aldridge Road, Perry Bar, Birmingham, Chemical Works Manager.
1890. Laycock, Dr. W. F., 46, Boar Lane, Leeds, Analytical Chemist.
1902. Lazell, Ellis Warren, 42, North 16th Street, Philadelphia, Pa., U.S.A., Chemist.
1898. Lean, Geo., 15, Park Terrace, Glasgow, Chemist.
1897. Leathart, Thos. H., c/o Locke, Blackett and Co., Ltd., Lead Works, Newcastle-on-Tyne, Lead Manufacturer.
- O.M. Leather, Dr. J. Walter, Dehra Dun, United Provinces, India, Government Agricultural Chemist.
1893. Le Boutillier, Clement, c/o Taylor Iron and Steel Co., High Bridge, N.J., U.S.A., Chemist.
1904. Le Chatelier, Prof. H., 75, Rue Notre Dame des Champs, Paris, France, Professor (l'Ecole des Mines).
1896. Lecomber, W. G., Cambridge Works, Knott Mill, Manchester, Engineer.
1896. Lederle, Dr. E. J., Health Department, New York City, U.S.A., Chief Chemist.
1892. Ledoff, Prof. A., Technological Institute, Kharkoff, Russia, Professor of Chemistry.
1895. Ledoux, Dr. Albert R., 99, John Street, New York City, U.S.A., Chemist.
1903. Ledoux, Aug. D., 68, Beaver Street, New York City, U.S.A., Importer of Pyrites.
1901. Lee, FitzHugh, c/o Grasselli Chemical Co., Cleveland, Ohio, U.S.A., Superintendent.
1905. Lee, John C., Mountford Street, Brookline, Mass., U.S.A., Assistant Engineer (American Telegraph and Telephone Co.).
1898. Lee, Jno. L., Woodfield, Lytham, Lancashire, Dyer and Bleacher.
1885. Lee, S. Wright, 6-10, Whitechapel, Liverpool, Wholesale Druggist.
1899. Lee, Waldemar, 4620, Wayne Street, Philadelphia, Pa., U.S.A., Chemist.
1886. Leeds, F. H., 26, East Bank, Stamford Hill, N., Analytical Chemist.
1903. Leerburger, Henry, 54, Beekman Street, New York City, U.S.A., Essential Oil Merchant.
1889. Leese, Joseph, 3, Lord Street West, Southport.
1903. Leese, Jos., jun., 13, Albert Place, Longsight, Manchester, Analytical and Technical Chemist.
1901. Lefebvre, Georges, Compagnie du Phospho-Gnau, 27 Rue La Rochefoucauld, Paris, Director.
1901. Lefler, Rudolf L., c/o Thos. Firth and Sons, Ltd., Norfolk Works, Sheffield, Metallurgical Chemist.
1901. Leibfried, Jno., E., Bethlehem, Pa., U.S.A., Analytical Chemist.
1888. Leigh, Cecil, Birmingham Metal and Munition Co., Adderley Park Rolling Mills, Birmingham, Technical Chemist.
1902. Leighton, A. E., Cordite Factory, Aruvankad, Nilgiris, India, Analytical Chemist.
1894. Leitch, Jno. W., Milnsbridge Chemical Works, near Huddersfield, Aniline Dye Manufacturer.
1904. Le Maistre, Fred J., Henry S. Spackman Engineering Co., 1619, Fillbert Street, Philadelphia, Pa., U.S.A., Organic Chemist.
1898. Leman, Wm. T., c/o The Texas Co., Beaumont, Tex., U.S.A., Oilworks Manager.
1901. Lengfeld, Dr. Felix, 202, Stockton Street, San Francisco, Cal., U.S.A., Manufacturing Chemist.
1883. Lennard, F., 70, Gracechurch Street, E.C.: and (Journals) 29, Adelaide Crescent, Hove, Sussex, Chemical Manufacturer.
1884. Leonard, Wm. J., 1, Lindfield Gardens, Hampstead, N.W., Naphtha Distiller.

1903. Lepsius, Prof. Dr. B., Griesheim a M., Germany, Director (Chem. Fabr. Griesheim-Elektron).
1888. Lequin, E., Directeur Général des Usines de Produits Chimiques de la Société de St. Gobain, 1, Place des Saussaies, Paris (VIII^e), France.
1904. Lesley, R. W., Pennsylvania Building, Philadelphia, Pa., U.S.A., Cement Manufacturer.
1894. Leslie, Hugh M., Marikuppam, Mysore State, South India, Chemical Engineer.
1899. Lesser, Wm., P.O. Box 162, Albany, N.Y., U.S.A., Manufacturing Chemist.
1904. Lessing, Dr. Rudolf, c/o The Gas Light and Coke Co., Tar and Liquor Works, Beckton, E., Chemist.
1900. Lessner, Chas. B., San Finx Tin Mines, Ltd., Carrill, Spain, Metallurgical Chemist.
1896. Lester, Isaac E., 57, Westminster Road, Handsworth, Birmingham, Steelworks Manager.
1892. Lester, J. H., Royal Exchange, Manchester, Analytical Chemist.
1904. Le Sueur, E. A., 50, MacLaren Street, Ottawa, Ont., Canada, Electrical and Chemical Engineer.
1899. Le Sueur, Dr. Henry R., Chemical Laboratory, St. Thomas' Hospital, London, S.E., Demonstrator.
1894. Lett, Stephen J., Morland, near Penrith, Chemical Engineer.
1898. Lenthardt-Thornton, Peter, 33, Rydal Gardens, Streatham, S.W., Chemical Manufacturer.
1891. Lever, Wm. H., Thornton House, Thornton Hough, Cheshire, Soap Manufacturer.
1901. Levett, Walter, Fairview, St. Margaret's Avenue; and (Journals) Mines Safety Explosives Co., Stanford-le-Hope, Essex, Factory Manager.
1903. Levi, Louis E., c/o Pfister and Vogel Leather Co., Milwaukee, Wis., U.S.A., Chemist.
1900. Levine, Edmund J., c/o The Fiberloid Co., 7, Waverley Place, New York City, U.S.A., Chemist.
1901. Levinstein, Dr. Herbert, (Journals) Hawkesmoor, Fallowfield, and (communications) 21, Minshull Street, Manchester, Chemist.
- O.M. Levinstein, Ivan, Hawkesmoor, Fallowfield, Manchester, Colour Manufacturer.
1901. Levy, Dr. Albert, Alfonsstrasse 15, Aachen, Germany, Works Chemist.
1903. Levy, Arthur G., 45, Warrington Crescent, Maida Vale, London, W., Chemist.
1887. Lewes, Prof. Vivian B., Royal Naval College, Greenwich, S.E., Professor of Chemistry.
1898. Lewin, H. James, Royal Victoria Yard, Deptford, S.E., Analytical Chemist.
1889. Lewis, A. E., 20, Seymour Street, Broadgreen, near Liverpool, Analytical Chemist.
1896. Lewis, Daniel C., c/o Millville Manufacturing Co., Millville, N.J., U.S.A., Dye Works Chemist.
1900. Lewis, Ernest A., 310, Dudley Road, Birmingham, Chemist and Metallurgist.
1904. Lewis, E. W., 97, Belgrave Road, Hford, E., Chemist.
1900. Lewis, John, 10, Windsor Road, Denmark Hill, S.E., Cashier (Paint Works).
1900. Lewis, Saml. J., 122, Newington Causeway, London, S.E., Pharmaceutical Chemist.
1889. Lewkowitsch, Dr. Julius, 71, Priory Road, West Hampstead, N.W., Consulting Chemist.
1901. Lichtenstein, Alf. F., c/o Geisenheimer and Co., P.O. Box 994, New York City, U.S.A., Chemist.
- O.M. Lichtenstein, Theodore, Chemical Works, Silvertown, E., Manufacturing Chemist.
1904. Liehtenthaeler, Robt. A., University of Florida, Lake City, Fla., U.S.A., Chemist.
1892. Liddle, G. A., Ring o' Bells, Church St., Wilmslow, Cheshire, Chemist, Dyewood Extract Works.
1885. Liddle, W. T., 14, Willows Avenue, Ansdell, Lytham, Lanes., Manager, Dyewood Extract Works.
1904. Lieber, Hugo, 25, West Broadway, New York City, U.S.A., Chemist.
- O.M. Liebmann, Dr. A., 16, Darby Avenue, West Didsbury, Manchester, Analytical Chemist.
1899. Liedbeck, P. F. Alarik, 43, Strandwagen, Stockholm, Sweden, Chemical Engineer.
- O.M. Lightfoot, T. E., 88, Arden Terrace, Acerington, Calico Printer's Chemist.
1905. Liley, Tho. A., 37, Aston Road, Bramley, Leeds, Chemist.
1898. Lilly, Josiah K., c/o Eli Lilly and Co., Indianapolis, Ind., U.S.A., Manufacturing Pharmacist.
1885. Lilly, Oliver M., The Croft, Spendon, Derby, Colour Manufacturer.
1904. Lindemann, Ottocar, 53, Victoria Street, Westminster, S.W., Managing Director (Korting Bros., Ltd.).
1903. Lindmueller, C., c/o United Zinc and Chem. Co., Argentine, Kansas, U.S.A., Chemist.
1897. Lindsay, Robt., Goldenhuis Deep G. M. Co., Cleveland, Johannesburg, Transvaal, Chemist.
1890. Ling, Arthur R., Laboratory, 74, Great Tower Street, E.C.; and (Journals) Hazelden, Kingston Road, New Malden, Consulting Chemist.
1904. Lippincott, Warren B., c/o United Zinc and Chemical Co., Argentine, Kansas, U.S.A., Chemist.
1896. Lishman, Geo. P., Banker Hill, Fence Houses, Co. Durham, Colliery Chemist.
1904. Litter, Hans, Farbchemisches Laboratorium der Kgl. Technischen Hochschule, Dresden, Germany, Chemist.
1901. Little, C. A., Elyria, Ohio, U.S.A., Analytical Chemist.
1889. Little, Wm. G., Blendon Grove, Bexley, Kent, Chemical Manufacturer.
- O.M. Littlejohn, Jas., c/o African Banking Corporation, Johannesburg, Transvaal, Analytical Chemist.
1902. Littlewood, Dr. Jas. B., U.S. Patent Office, Washington, D.C., U.S.A., Chemical Examiner.
1904. Livermore, W. D., Washington Mill, Lawrence, Mass., U.S.A., Chemist.
1886. Liversedge, A. J., Clock House, Arundel Street, Strand, London, W.C., Mechanical Engineer.
1904. Liverseege, J. E., Council House, Birmingham, Public Analyst.
- O.M. Liversidge, Prof. A., F.R.S., The University, Sydney, N.S.W., Professor of Chemistry.
1883. Livingston, W. J., London County Council, Spring Gardens, London, S.W., Analytical Chemist.
1903. Llewellyn, Ivor P., c/o Peter Spence and Sons, Ltd., Manchester Alum Works, Manchester, Chemist.
1899. Lloyd, Charles, (subscriptions) c/o Lake View Consols, Ltd., Salisbury House, London, E.C.; and (Journals) c/o Manager, Lake View Consols, Ltd., Boulder, West Australia, Secretary.
1900. Lloyd, Fred. J., Muscovy House, Trinity Square, London, E.C., Analyst.
1904. Lloyd, Leonard B., Broadford Tannery, Broadford, Victoria, Australia, Tanner.
1900. Lloyd, Thos. H., c/o Quibell Bros., Newark, Analyst.
1901. Lober, Jno. B., Vulcanite Portland Cement Co., 1230, Land Title Building, Philadelphia, Pa., U.S.A., Cement Manufacturer.
1888. Lodge, Edw., 25, Scale Hill, Cowcliffe, Huddersfield, Teacher of Wool Dyeing.
1900. Loch, Dr. Morris, New York University, University Heights, New York City, U.S.A., Professor of Chemistry.
1891. Loewenthal, Dr. R., Uhlandstrasse 39, Frankfurt a M., Germany, Lecturer on Dyeing.
1899. Logan, John, Offendene, Oakfield Drive, Ashton-on-Mersey, Indigo-blue Dyer.
1905. Lomax, Abraham, 30, Taskers Lane, Kearsley, Farnworth, R.S.O., Potter's Chemist.
1901. Long, Eugene J., c/o E. O. Callaghan and Son, City Tannery, Limerick, Ireland, Tanner.
1902. Longden, Alf. Hy., Stanton-by-Dale, Nottingham, Analytical Chemist.
1898. Longstaff, Jas. P., Chemical Department, The University, Edinburgh, Assistant.
1904. Loomis, Dr. H., 58, West 40th Street, New York City, U.S.A.
1902. Loomis, Henry M., 1326, De Kalb Street, Norristown, Pa., U.S.A., Chemist.
1890. Lord, F. J., 4, Winmarleigh Street, Warrington, Analytical Chemist.
1896. Lord, Jno. Lloyd, 23, Park View, Elton, Bury, Lanes., Chemist and Manager.

1897. Lord, N. W., 338, West 8th Avenue, Columbus, Ohio, U.S.A., Professor of Metallurgy.
- O.M. Lorenz, H., 7 and 8, Idol Lane, London, E.C., Chemical Merchant.
- O.M. Lorimer, J., Britannia Row, Islington, N., Manufacturing Chemist.
1904. Lorimer, John H., 280, West Walnut Lane, Germantown, Philadelphia, Pa., U.S.A., Textile Machinist and Merceriser.
- O.M. Lorrain, J. G., Norfolk House, Norfolk Street, Strand, London, W.C., Civil Engineer.
1904. Lossen, Dr. Clemens F., c/o Gulf Refining Co., Port Arthur, Texas, U.S.A., Chemist.
- O.M. Lott, F. E., The Laboratory, Bridge Chambers, Burton-on-Trent, Consulting Brewing Chemist.
- O.M. Louis, D. A., 77, Shirland Gardens, London, W., Metallurgist and Mining Engineer.
1894. Louis, Prof. Henry, Armstrong College, Newcastle-on-Tyne, Professor of Mining.
- O.M. Love, Dr. E. G., 80, East 55th Street, New York City, U.S.A., Analytical Chemist.
1899. Love, Wm., 28, Royal Exchange Square, Glasgow, Managing Director (Brockburn Oil Co., Ltd.).
1895. Lovejoy, Frank W., Kodak Park, Rochester, N.Y., U.S.A., Chemical Engineer.
1904. Loveland, Jas. W., 8, Kenwood Street, West Somerville, Mass., U.S.A., Superintendent of Soap Works.
- O.M. Lovibond, J. W., Lake House, Salisbury, Tintometer Manufacturer.
- O.M. Lovibond, T. W., West Jesmond House, Newcastle-on-Tyne, Brewer.
1897. Low, Albert H., P.O. Drawer 1537, Denver, Colo., U.S.A., Metallurgical Chemist.
1900. Low, Prof. Wilson H., Cudahy Packing Co., South Omaha, Neb., U.S.A., Chemist.
1887. Lowe, Clement W., Cornbrook, Leigh Road, Knutsford, Cheshire, Manufacturing Chemist.
1905. Lowe, Houston, The Lowe Bros. Co., Dayton, Ohio, U.S.A., Paint and Varnish Maker.
- O.M. Lowe, W. F., 9, Hough Green, Chester, Analytical Chemist.
1904. Lowenstein, Arthur, c/o Nelson, Morris and Co., U.S. Yards, Chicago, Ill., U.S.A., Chemist.
1885. Lowson, J. G. F., 18, Coates' Gardens, Edinburgh, Paper Maker.
1895. Lucas, Alf., Survey Department, Public Works Ministry, Cairo, Egypt, Analyst.
1892. Lucas, Bernard R., Winton Park, Northwich, Alkali Works Manager.
- O.M. Lucas, R., Alwinenstrasse 11, Wiesbaden, Germany, Technical Chemist.
- O.M. Luck, Alf., Naval Arsenal, Zarate, Argentina, Explosives Chemist.
1900. Lummus, Walter E., 62, Newhall Street, Lynn, Mass., U.S.A., Manager (Commonwealth Manufacturing Co.).
1903. Lumsden, Alex. A., Forth Chemical Works, Bo'ness, N.B., Technical Chemist.
1888. Lund, Jas., 142, Hawthorne Street, Malden, Mass., U.S.A., Ammonia Works Manager.
1888. Lundholm, Carl O., Nobel's Explosives Co., Ltd., Ardeer Factory, Stevenston, Ayrshire, Manager.
1898. Lundteigen, Andreas, Union City, Mich., U.S.A., Chemist.
- O.M. Lunge, Prof. Dr. G., Steinwiesstrasse 40, Zürich, V., Switzerland, Professor of Chemistry.
1894. Lungwitz, Theo., c/o Chas. Pfizer and Co., 81, Maiden Lane, New York City, U.S.A., Chemist.
1885. Lupton, Sydney A., 102, Park Street, Grosvenor Square, London, W.
1890. Luthy, Edmund O., 2419, Ohio Avenue, Cincinnati, Ohio, U.S.A., Distiller.
1884. Lüthy, Otto, Maywood, N.J., U.S.A., Analytical Chemist.
1895. Luxmoore, Dr. Chas. M., University College, Reading, Lecturer on Chemistry.
1899. Luxton, Thos., 28, Albany Street, Hull, Teacher of Chemistry.
1903. Lye, Ernest B., Legrave Hall, near Luton, Beds., Straw Plait Dyer and Bleacher.
1885. Lye, W. T., Legrave Hall, near Luton, Beds., Straw Dyer.
1884. Lyle, James, Ardesco, Plaistow Wharf, Victoria Docks, E., Sugar Refiner.
1885. Lyle, Jno., 21, Mincing Lane, London, E.C., Sugar Refiner.
1902. Lyle, Robert F., Berry Yards Sugar Refinery, Greenock, N.B., Analytical Chemist.
1889. Lynn, Arthur H., 125, Alexandra Road, Wimbledon, Chemical Works Manager.
1899. Lynn, R. Rankine, 7, Highburgh Terrace, Dowanhill, Glasgow, Chemical Engineer.
1898. Lynne, Miss Mary S., 421, Wood Street, Pittsburg, Pa., U.S.A., Chemist.
1902. Lyon, Edwd. H., 520, West 27th Street, New York City, U.S.A., Manufacturing Chemist.
- O.M. Lyon, J. G., The Aire Tar Works, Knottingley, Yorks., Tar Distiller.
- O.M. Lyte, F. Maxwell, 60, Finborough Road, Redcliffe Square, London, S.W., Chemical Manufacturer.
- O.M. Lytle, A. M., North of Ireland Chemical Co., Ltd., 34, Victoria Street, Belfast, Ireland, Chemical Manufacturer.

M

1898. Maass, Frank, P.O. Box 507, Paterson, N.J., U.S.A., Silk Dyer.
1904. Mabey, Fred Carleton, McMaster University, Toronto, Ont., Canada, Assistant in Chemistry.
1887. Mabery, Prof. Chas. F., Case School of Applied Science, Cleveland, Ohio, U.S.A., Professor of Chemistry.
1894. Mabey, Fred O., 196, Amhurst Road, Hackney, N.E., Wine Merchant.
1891. Macadam, Herbert E., Milton House, Selsdon Road, Wanstead, Essex, Manure Works Manager.
1894. Macadam, Stevenson, 55, York Place, Edinburgh, Analytical Chemist.
1894. McAlley, Robt., Bankside, Falkirk, N.B., Paint Works Manager.
1891. Macallan, J., 3, Rutland Terrace, Clontarf, Dublin, Analytical Chemist.
1892. Maeara, Thos., jun., c/o Jas. Robertson and Sons, Thrushgrove Works, Paisley, N.B., Chemist.
1889. McArthur, Jno., 196, Trinity Road, Wandsworth Common, S.W., Chemist.
1887. McArthur, J. B., Price's Patent Candle Co., Limited, Bromborough Pool, near Birkenhead, Chemist.
- O.M. McArthur, J. S., 45, Renfield Street, Glasgow, Consulting Chemist and Metallurgist.
1901. MacArthur, Jno. S., 15, St. John's Road, Pollokshields, Glasgow, Paint and Varnish Manufacturer.
1892. McArthur, Thos., 7, Temple, Dale Street, Liverpool, Drysalter and Dyewood Extractor.
1898. MacCallum, D. A., 389, Central Chambers, 93, Hope Street, Glasgow, Chemist.
- O.M. McCallum, J. M., Southdene, Paisley, N.B., Soap Manufacturer.
1903. McCandless, Jno. M., State Laboratory, Atlanta, Ga., U.S.A., Analytical Chemist.
1894. McCann, Owen, c/o J. Gilton and Co., Oriol Street, Vauxhall Road, Liverpool, Printing Ink Manufacturer.
1893. McCombie, C., 19, St. Dunstan's Hill, London, E.C., Drug and Chemical Merchant.
1903. McCourt, Cyril D., 52, Victoria Road, Clapham, S.W., Research Chemist (Morgan Crucible Co.).
- O.M. McCowan, W., Essex Wharf, Narrow Street, Limehouse, E.
1897. McCrae, Dr. John, jun., 7, Kirklee Gardens, Kelvin-side, Glasgow, Chemical Demonstrator.
1898. McCreath, Wm. D., c/o Quantock Vale Cider Works, North Petherton, Bridgewater, Cider Manufacturer.
1884. McCulloch, J., 13, Clarence Drive, Hyndland Road, Glasgow, Chemical Works Manager.
1900. McCulloch, John, Glencoe, Lostock Gralam, Cheshire, Chemical Engineer.

1903. McCully, R. E. J., 251, Mudstone Road, Rochester, Kent, Analytical Chemist.
- O.M. McDaniel, J. J., Woodlands, Bandon, Ireland, Distiller.
- O.M. Macdonald, A., 72, Great Clyde Street, Glasgow.
1897. MacDonadd, G. W., c/o Curtis's and Harvey, Ltd., Dartford, Kent, Explosives Chemist.
- O.M. Macdonald, J. W., Cleveland, The Globe, Blackheath, S.E., Analytical Chemist.
1902. Macdonald, Peter, jun., Mazapul Copper Co., Ltd., Concepcion del Oro, Zacatecas, Mexico, Analytical Chemist.
1899. MacDonald, S. Fremont, c/o Ashtabula Hide and Leather Co., Ashtabula, Ohio, U.S.A., Tanner.
- O.M. McDonald, T. M., Wahlabo Estate, St. Vincent, West Indies, Sugar Chemist.
1899. McDougall, Hugh, 45, Warton Terrace, Newcastle-on-Tyne, and (Journals) Johnson's Cement Works, Gateshead-on-Tyne, Chemical Engineer.
1895. McDougall, Isaac, jun., The Orchard, Hale, near Manchester, Student.
1895. McDougall, Isaac S., The Orchard, Hale, near Manchester, Manufacturing Chemist.
1890. McDougall, J. T., Dunolly, Morden Road, Blackheath, S.E., Manufacturing Chemist.
1905. McDowell, Stewart H., 1246, South 51st Street, Philadelphia, Pa., U.S.A.
1889. MacEwan, Peter, 61, Southwood Lane, Highgate, N., Editor of "Chemist and Druggist."
1891. McEwen, Atholl F., 1, Northbrook Road, Lee, S.E., Analytical Chemist and Assayer.
1901. McEwen, Duncan C., c/o British and Korean Corporation, Ltd., Gwendoline, Korea, Metallurgical Chemist.
1902. McFarland, Alan R., c/o Solvay Process Co., Syracuse, N.Y., U.S.A., Alkali Works Manager.
- O.M. Macfarlane, R. F., Tharsis Copper Works, East Moors, Cardiff, Technical Chemist.
1884. Macfarlane, Thos., 317, Queen Street, Ottawa, Canada, Analyst to Dominion of Canada.
1901. McFarlane, Walter, Sunnyside, Manswood, Pollockshaws, Glasgow, Sinterworks Manager.
1890. McFarlane, W. W., 522, West 9th Street, Chester, Pa., U.S.A., Dyeworks Manager.
1893. McGhie, T. Burns, c/o Quirk, Barton and Co., Normandy Wharf, Rotherhithe, S.E., Analytical Chemist and Assayer.
1904. McGill, A., 317, Queen Street, Ottawa, Canada, Analytical Chemist.
1891. McGill, Dr. J. T., Vanderbilt University, Nashville, Tenn., U.S.A., Adjunct Professor of Chemistry.
1899. MacGillivray, Wm. A., c/o Swansea Safety Fuse Co., Pipe House Wharf, Swansea, Analytical Chemist.
1887. McGlashan, John, Cawnpore Sugar Works, Cawnpore, India, Technical Chemist.
1902. McGovney, Chas. S., Experiment Station, West La Fayette, Ind., U.S.A., Chemist.
1884. McGowan, John, Ash House, Talke, near Stoke-upon-Trent, Colliery Manager.
1896. McIlhiney, Dr. Parker C., 145, East 23rd Street, New York City, U.S.A., Chemist.
1894. McIlwaine, Alf. W., Stoneferry, Hull, Oil Manufacturer.
- O.M. MacIndoe, G. D., Ettrick Street, Invercargill, New Zealand, Chemical Works Manager.
1903. Macintire, Benj. Gould, P.O. Box 365, Rumford Falls, Maine, U.S.A., Chemist.
1904. Macintosh, J. C., Helen Mine, Michipicoten, Ont., Canada, Chemist.
1888. MacKean, Wm., Welsbach Incandescent Gas Light Co., Ltd., Broomhill Road, Wandsworth, S.W., Technical Chemist.
- O.M. McKechnie, D., Heath House, Runcorn, Copper Extractor.
- O.M. McKechnie, D. M., Metal Works, Widnes, Lancashire, Copper Extractor.
1904. McKechnie, R. D., c/o The British Explosives Syndicate, Ltd., Pitsea, Essex, Chemist.
1887. McKellar, W. G., c/o United Alkali Co., Ltd., Eglington Works, Irvine, N.B., Technical Chemist.
1904. McKenna, A. G., 506, Hawkin Avenue, Bradlock, Pa., U.S.A., Metallurgical Chemist.
1895. McKenna, Dr. Cha. F., 221, Pearl Street, New York City, U.S.A., Chemist.
1903. McKenny, Chas., Bayview House, Drogheda, Ireland, Chemical Engineer and Manure Manufacturer.
1899. Mackenzie, Alex. H., 40, Hall Street, North Adams, Mass., U.S.A., Colour Mixer.
1893. McKerrow, C. A., Thornbank, Knutsford Road, Alderley Edge, Cheshire, Consulting Chemist.
1893. McKesson, John, 91, Fulton Street, New York City, U.S.A., Manufacturing Chemist.
1891. Mackey, W. McD., Victoria Chambers, Leeds, Analytical Chemist.
1900. McKillop, George F., Broxburn Oil Works, Broxburn, N.B., Works Chemist.
1890. McKillop, Jas., 93, Brook Green, London, W., Metallurgist.
1902. McKim, Wm., 25, Fairview Street, Yonkers, N.Y., U.S.A., Colour Maker.
1898. McLaurin, Robt., 44, Sauchiehall Street, Glasgow, Chemist.
1888. MacLean, Alex. S., 31, Bank Street, Greenock, N.B., Soap Refiner.
- O.M. McLellan, J. A., Beech Cottage, Boothferry Road, Goole, Chemical Manufacturer.
1892. McLeod, Jas., Westhill, Cirdross Road, Dumbarton, N.B., Analytical Chemist and Gas Examiner.
1903. MacMahon, F. W., S. Niederwald Road, Sydenham, S.E., Chemist (Oxychlorides, Ltd.).
1896. McMaster, Daniel, c/o Oxford Paper Co., Rumford Falls, Maine, Paper Mill Manager.
1894. Macmillan, Arch., 12, Hastings Street, Sunderland.
1903. McMillan, Charles, 20, Corn Market, Belfast, Ireland, Chemist.
1904. McMullen, Alan, 108, James Street, Dublin, Ireland, Brewer.
1889. McMurtrie, J. M., 21, Princes Street, Pollokshields, Glasgow, Brass Founder.
1900. McMurtrie, Dr. Wm. T., 141, West 49th Street, New York City, U.S.A., Chemist.
1895. McMurtry, G. C., Wallaroo Smelting Works, Wallaroo, South Australia, Manager.
- O.M. Macnab, W., 10, Cromwell Crescent, London, S.W., Analytical Chemist.
1892. McVie, Jas. P., Ravenscraig, Canning Street, Hebburn-on-Tyne, Analytical Chemist.
1891. McVitie, Robt., 25, Nicoll Road, Harlesden, N.W., Biscuit Manufacturer.
1901. Maertens, Emile, P.O. Box 1002, Providence, R.I., U.S.A., Engineer.
1895. Magnus, Isidor, 52, Leadenhall Street, London, E.C., Chemical Merchant.
1901. Magruder, Egbert W., Department of Agriculture, Richmond, Va., U.S.A., Chemist.
1885. Mahon, R. W., N. Y. Central and Hudson River Railroad, West Albany, N.Y., U.S.A., Chemist.
1898. Main, Wm., 299, Jefferson Avenue, Brooklyn, N.Y., U.S.A., Chemical Expert.
1904. Mair, William, 7, Comiston Road, Edinburgh, Chemist.
- O.M. Major, J. Lewis, Welton Garth, Brough, East Yorks., Tar Distiller and Chemical Manufacturer.
1886. Mallinckrodt, Edw., Mallinckrodt Chemical Works, St. Louis, Mo., U.S.A., Manufacturing Chemist.
1897. Mallory, J. Halsey, Drawer 69, Columbia, S.C., U.S.A., Assistant Chemist (The American Cotton Oil Co.).
1896. Mann, E. A., Government Laboratory, Perth, Western Australia, Government Analyst.
1893. Mann, Harold H., Indian Tea Association, Royal Exchange Buildings, Calcutta, India, Research Chemist.
1899. Mann, Jas. S., 97, Greengate Street, Plaistow, Essex, Analyst.
1891. Mann, John C., 9, Lambert Street, Hull, Chemist.
1903. Mannhardt, Hans, 1641, Melrose Street, Chicago, Ill., U.S.A., Analytical Chemist.
- O.M. Mannington, H. T., Marehlea, Beaconsfield Road, Farnworth, Widnes.

1892. Mansbridge, Wm., 27, Elmbank Road, Sefton Park, Liverpool, Chemist.
1893. Marchlewski, Dr. L., Strzelecka 9, Krakow, Austria.
1904. Marchworth, O. S., Ohio Testing Laboratory, 19 and 25, Board of Trade, Columbus, Ohio, U.S.A., Analytical Chemist.
1903. Mardick, Jno. R., c/o Wm. F. Moser and Co., Du Bois, Pa., U.S.A., Chemical Engineer.
1904. Maréchal, H., Eugene Maréchal et fils, Vénissier (Rhône), France, Oilcloth Manufacturer.
1883. Markel, Dr. K., Lodge Lane, Bewsey, Warrington, Technical Chemist.
1886. Markham, A. D., 71, Queen Street, Hull, Pharmaceutical Chemist.
1905. Marland, Percy, c/o Brotherton and Co., Ltd., Ammonia Works, Wakefield, Yorks., Chemist.
1905. Marlatt, Wilbur T., Oakville, Ont., Canada, Leather Manufacturer.
1902. Marriott, F. Grant, 14, Selby Street, Toronto, Canada, Chemical Student.
1904. Marris, H. C., The Russian Steam Oil Mills Co., 32, Kourlandski Street, St. Petersburg, Russia, Analytical Chemist.
1904. Marschall, Adolf J., Little Falls, N.Y., U.S.A., Chemist.
1901. Marsden, Dr. Fred., 3, Mannville Terrace, Bradford, Yorks., Chemist.
1905. Marsh, John, 6, Netherby Terrace, South Stifford, Grays, Essex, Cement Works Chemist.
- O.M. Marsh, J. T., Ammonia Soda Works, Fleetwood, Lancashire, Chemist.
1883. Marsh, W., Union Alkali Co., Solio Works, Manchester, Chemical Manufacturer.
1895. Marshall, Arthur, Hope Cottage, Church Hill, Loughton, Essex, Explosives Chemist.
1891. Marshall, Dr. Hugh, 12, Lonsdale Terrace, Edinburgh, Professor of Chemistry.
1895. Marshall, Francis G., 4, Woodhouse Terrace, Bewick Road, Gateshead, Technical Chemist.
1901. Marshall, Jos. W., Boulevard Higher Grade School, Hull, Science Lecturer.
1896. Marshall, Percy S., Union Laboratory, Half Moon Street, Huddersfield, Assistant Chemist.
1883. Marshall, Wm., Carisbrook, Queen's Road, Cheadle Hulme, Cheshire, Dyer.
1884. Marshall, Wm., Barkley, Teddington, Middlesex, Analytical Chemist.
1904. Marston, John P., 247, Atlantic Avenue, Boston, Mass., U.S.A., Merchant.
1894. Martin, Alex. M., Hillview, Twechar by Glasgow, Analytical Chemist.
1895. Martin, Chas. H., 14, Aldred Street, Crescent, Salford, Oil and Soap Works Manager.
- O.M. Martin, N. H., Ravenswood, Low Fell, Gateshead-on-Tyne, Manufacturing Chemist.
1904. Martin, W. C., College Station, Texas, U.S.A., Instructor in Industrial Chemistry.
1899. Martin, Wm. E., c/o Kynoch Ltd., Arklow, Co. Wicklow, Ireland, Chemist.
- O.M. Martin, W. H., 183B, King's Road, Chelsea, London, S.W., Analytical Chemist.
1887. Martineau, Sydney, Northwood, Rydal Road, Streatham, S.W., Sugar Chemist.
1894. Marty, T. Graham, 11, Stratton Terrace, Truro, Cornwall, Metallurgist.
1902. Marx, Joseph S., California Powder Works, Pinole, Cal., U.S.A., Chemist.
1905. Marx, Dr. Max, 81, Shanley Avenue, Newark, N.J., U.S.A., Manufacturing Chemist.
1904. Mason, Dr. Edward D., c/o Messrs. Grimshaw Brothers and Co., Ltd., Clayton, Manchester, Chemist.
1904. Mason, Glen F., c/o H. J. Heinz Co., Pittsburg, Pa., U.S.A., Chemist.
1887. Mason, J. Francis, Eynsham Hall, Witney, Oxon.
1892. Mason, Thos., Beech Avenue, Nottingham, Manufacturing Chemist.
1903. Massey, Joseph B., 60, Colne Road, Burnley, Chief Sanitary Inspector.
- O.M. Masson, Prof. D. Orme, University of Melbourne, Victoria, Australia, Professor of Chemistry.
1904. Masson, Victor E., Pleasant Valley Wine Co., Rheims, Stenben Co., N.Y., U.S.A., Chemist.
1889. Master, Ardesheer B., 679, Tardeo, Bombay, India, Chemical Manufacturer.
1902. Masujima, Bunjiro, 19, Honjoku Midoricho San-chome, Tokyo, Japan, Prof. of Applied Chemistry.
1903. Masure, Gaston, 7, Rue de Constantine, Rouen, France, Chemist.
1902. Masury, Fred. L. M., Sharon, Pa., U.S.A., Explosives Manufacturer.
- O.M. Mather, J., Blaydon Chemical Works, Blaydon-on-Tyne, Manager.
1904. Mather, J. Cecil, 15, The Holloway, Runcorn, Cheshire, Works Chemist.
1900. Mather, Wm., c/o British Aluminium Co., Ltd., Larne Harbour, Co. Antrim, Ireland, Chemist.
1890. Mathesson, W. J., c/o Cassella Colour Co., 182, Front Street, New York City, U.S.A., Chemical Merchant.
1901. Mathew, W. E. B. de Vere, Shanklin, Lucion Road, Upper Tooting, S.W., Analytical Chemist.
1900. Mathews, Dr. Jno. A., c/o Crucible Steel Co. of America, Syracuse, N.Y., U.S.A., Chemist.
1898. Mathewson, E. P., Anaconda, Mont., U.S.A., Metallurgist.
1888. Mátyás, Louis J., 105, North 19th Street, East Orange, N.J., U.S.A., Chemist.
1896. Matsui, G., c/o Japan Sugar Refinery Co., Onagigawa, Tokio, Japan, Chemical Engineer.
1899. Matthews, Dr. J. Merritt, 425, South Broad Street, Philadelphia, Pa., U.S.A., Professor of Chemistry and Dyeing (Philadelphia Textile School).
1889. Mawdsley, W. H., c/o Gold Mining Co., Ltd., Mount Morgan, Queensland, Chemist.
1903. Maxim, Hudson, 891, Sterling Place, Brooklyn, N.Y., U.S.A., Chemist and Mechanical Engineer.
1894. Maxwell, Jno., Solway Chemical Works, Silloth, and (communications) English Street, Carlisle, Cumberland, Chemical Manure Manufacturer.
1903. Maxwell, Orin P., Piedmont, Mineral Co., West Va., U.S.A., Chemist.
1897. May, George H., c/o Fabrikoid Co., Newburgh, N.Y., U.S.A., Assistant Chemist.
1901. May, Dr. Sidney, 313, East 112th Street, New York City, U.S.A., Lecture Assistant.
1884. Mayenfeld, Dr. E. von Salis. *See* Salis-Mayenfeld, Dr. E. von.
1903. Mayer, Andrew, jun., 104, St. Mark's Avenue, Brooklyn, N.Y., U.S.A., Chemist.
1896. Mayfield, A. S., 14, Beresford Avenue, Hull, Analyst.
1892. Mayfield, H. B., Normanhurst, Mundy Street, Heanor, near Nottingham, Dyer.
1901. Mayfield, Thos., Fair View House, Heanor, near Nottingham, Hosiery Manufacturer.
1885. Mayhew, E. W. A., High Street, Freemantle, Western Australia, Manufacturing Chemist.
1904. Mays, Edmund A., 100, North Moore Street, New York City, U.S.A., Chemist.
1900. Maywald, F. J., 1028, 72nd Street, Brooklyn, N.Y., U.S.A., Technical Chemist.
1902. Meade, Richard K., Nazareth, Pa., U.S.A., Chemist.
1904. Meads, Charles J., Bel Air, Dartmouth, Inland Revenue Officer.
1903. Mears, James, 77, Arden Road, Handsworth, Birmingham, Analytical Chemist.
1898. Needs, Alonzo D., 2424, Harriet Avenue, Minneapolis, Minn., U.S.A., Analytical Chemist.
1896. Meggitt, Loxley, Wheatstaple Works, Alexandrina, Sydney, N.S.W., Australia, Analytical Chemist.
1901. Meier, Dr. Franz, Basle Chemical Works, Basle, Switzerland, Chemist.
1888. Meikle, Jno., 8, Melrose Street, Great Western Road, Glasgow, Journalist.
1902. Melcher, Arthur C., 58, Bowen Street, Newton Centre, Mass., U.S.A., Chemist.
- O.M. Meldola, Prof. R., F.R.S., 6, Brunswick Square, London, W.C., Professor of Chemistry.
1901. Meldrum, Dr. And. N., 16, Moorocks Road, Sheffield, Lecturer on Chemistry.
1891. Meldrum, Jas. Jones, Timperley, Cheshire, Manufacturing Engineer.

1891. Mellen, E. D., 1590, Massachusetts Avenue, Cambridge, Mass., U.S.A., Treasurer (Curtis, Davis, and Co.).
- O.M. Mellon, W. W., 9, Glenart Avenue, Blackrock, Co. Dublin, Ireland, Manufacturing Chemist.
1902. Mellor, Percy H., Burton Road, Woodville, near Burton-on-Trent, Pottery Manager.
- O.M. Mellor, S., Magnesium Metal Co., Patricroft, Manchester, Metal Refiner.
1884. Melville, D., P.O. Box No. 1, Woodmere, Wayne Co., Mich., U.S.A., Chemical Works Manager.
1893. Mensching, Dr. C., c/o Act-Ges. für Anilinfabrikation, Berlin, S.O., Germany, Chemist.
- O.M. Menzies, R. C., Inveresk Mills, Musselburgh, N.B., Paper Maker.
1892. Mercer, C. A., 31, Camomile Street, London, E.C., Chemical Apparatus Maker.
1886. Mercer, J. B., 330, Lower Broughton Road, Manchester.
1890. Merck, E., Darmstadt, Germany, Manufacturing Chemist.
1905. Merck, George, Merck and Co., University Place, New York City, U.S.A., Manufacturing Chemist.
1887. Merrell, Geo., Lock Box 786, Cincinnati, Ohio, U.S.A., Manufacturing Chemist.
1905. Merrin, A. C., 44, Bishopsgate Street Without, London, E.C., Assistant Editor and Analyst.
1899. Merrill, Frank H., Los Angeles Soap Co., Los Angeles, Cal., U.S.A., Factory Superintendent.
1903. Merrill, Herbert C., 38, Main Street, Peabody, Mass., U.S.A., Chemical Engineer (Leather Factory).
1902. Merritt, Wm. G., 643, Second Avenue, Detroit, Mich., U.S.A., Chemical Engineer.
1904. Merry, Jno. B., 61, Woodfield Road, Kings Heath, near Birmingham, Works Chemist.
1903. Mersan, Ferdinand de, 17, Cecil Street, Gainsborough, Lincolnshire, Chemist.
1903. Messereau, G., Susquehanna Dyeworks, Williamsport, Pa., U.S.A., Chemist.
1905. Merz, Eugene, P.O. Box 216, Newark, N.J., U.S.A., General Superintendent, Heller and Merz Co.
1905. Merzbacher, Aaron, Laboratory, Reading Iron Co., Reading, Pa., U.S.A., Chemist.
1897. Meslans, Prof. M., 59 Quai de la Baronnie, Ablon (Seine et Oise), France, Professor of Chemistry.
- O.M. Messel, Dr. R., 147, Victoria Street, London, S.W., Chemical Manufacturer.
1899. Metcalf, Howard F., Farr Alpaca Co., Holyoke, Mass., U.S.A.
1886. Metcalf, Jno., Moorfield, Altham, near Accrington, Tar Distiller.
1898. Metz, Herman A., P.O. Box 2178, New York City, U.S.A., Chemical Merchant.
1900. Mewborne, Robt. G., c/o Kentucky Tobacco Product Co., Louisville, Ky., U.S.A., Chemist.
1904. Meyenberg, Dr. Alex., 9, Nelson Street, Plymouth Grove, Manchester, Works Manager.
1902. Meyer, August R., c/o United Zinc and Chemical Co., Kansas City, Mo., U.S.A., Metallurgist.
1898. Meyer, Dr. Franz, 52, Broadway, New York City, U.S.A., Metallurgical and Chemical Engineer.
1902. Meyer, Dr. Fredk. L., 2028, Park Avenue, Philadelphia, Pa., U.S.A., Chemist.
1900. Meyer, Karl, Sortedams Dosserring 95A, Copenhagen, O., Denmark.
1904. Meyer, Prof. Dr. Richard, Technische Hochschule, Braunschweig, Germany, Professor of Chemistry.
1902. Meyrick, L. J., 137, City Road, Birmingham, Assistant Analyst.
1903. Miall, Dr. Stephen, 6, Stone Buildings, Lincoln's Inn, London, W.C., Solicitor.
1904. Mighill, Thos. A., 127, Purchase Street, Boston, Mass., U.S.A., Chemist.
1896. Miles, G., Wellington, 29, Central Street, Boston, Mass., U.S.A., Analytical Chemist.
1889. Milestone, W. C., 7, Heathfield Road, Wandsworth Common, S.W., Chemical Works Manager.
1899. Millar, Jas. H., P.O. Box 120, Durban, Natal, Manufacturing and Analytical Chemist.
1897. Millard, Edgar J., 40-42, Charlotte Street, London, E.C., Chemist and Manager.
1903. Miller, J. Dunlop, Mount Beckett Smelting Works, Launceston, Tasmania, Analyst and Assayer.
1883. Miller, Dr. A. K., Kalyett's Buildings, Withy Grove, Manchester, Analytical Chemist.
- O.M. Miller, E. V., Sugar Works, Chelsea, Auckland, New Zealand, Sugar Works Chemist.
1889. Miller, Geo., 54, Ramdies Road, Sefton Park, Liverpool, Technical Chemist.
1897. Miller, Dr. Edmund H., School of Mines, Columbia University, New York City, U.S.A., Chemist.
1900. Miller, Hampton K., Lake City, Fla., U.S.A., Chemist, Florida A. & M. College.
1893. Miller, Dr. Harry E., 1015, Chestnut Street, Oakland, Cal., U.S.A., Chemist.
1902. Miller, H. Harold, Consumers' Gas Co., 269, Front Street East, Toronto, Canada, Chemist.
1883. Miller, Dr. H. von, H., Bentringasse 32, Wien, Austria, Chemical Manufacturer.
1901. Miller, Chas. E., 58, Chardon Street, Boston, Mass., U.S.A., Manufacturing Chemist.
1904. Miller, Jas., 1478, Duane Street, New York City, U.S.A., Pharmacist.
1897. Miller, Jas., Minas de Sao Bento, Santa Barbara de Matto Dentro, Minas Geraes, Brazil, Metallurgical Chemist.
1894. Miller, Dr. John A., 40-45, Lewis Block, Buffalo, N.Y., U.S.A., Consulting Chemist, State Analyst.
1894. Miller, J. Carlile, 89, Rumford Street, Bridgeton, Glasgow, Manufacturing Chemist.
1888. Miller, J. Hopkins, 5, Catherine Street, Parliamentary Road, Glasgow, Dyeworks Chemist.
1889. Miller, Jno. Poynter, Sandilands Chemical Works, Aberdeen, Technical Chemist.
1884. Miller, Dr. N. H. J., Harpenden, near St. Albans, Agricultural Chemist.
1899. Miller, P. Schuyler, Mount Prospect Laboratory, Flatbush Avenue, Brooklyn, N.Y., U.S.A., Chemist.
1901. Miller, Stuart B., 701, South 20th Street, Birmingham, Ala., U.S.A., Chemical Engineer.
1904. Miller, William Exley, c/o The Arizona Copper Co., Ltd., 29, St. Andrew Square, Edinburgh, Secretary.
1901. Miller, W. Lash, 50, St. Alban Street, Toronto, Canada, Associate Professor of Physical Chemistry.
1884. Miller, W. M., Caledonia Estate, Prov. Wellesley, Penang, S.S., Sugar Chemist.
1902. Milligan, R. E., New York Continental Jewell Filtration Co., 15, Broad Street, New York City, U.S.A., Chemical Engineer.
1903. Millington, Abraham, c/o J. Parry, E.V. Wharf, The Docks, Newport, Mon., Metallurgical Chemist.
1904. Millroy, Alfred T., 53, Guilford Street, London, W.C., Laboratory Furnisher.
- O.M. Mills, Prof. E. J., F.R.S., 64, Twyford Avenue, West Acton, W., Professor of Chemistry.
1904. Mills, Dr. J. E., University of North Carolina, Chapel Hill, N.C., U.S.A., Associate Professor of Chemistry.
1905. Milne, Thomas, c/o The Gas Light and Coke Co., Ltd., 4, Fenchurch Avenue, London, E.C., Chemical Products Salesman.
1903. Milnes, Crosswell, Arlesey, near Hitchin, Herts., Chemist.
1887. Milnes, Edmund, Seedfield, Bury, Lancashire, Dyeing Extract Maker.
1902. Milnes, Ernest E., c/o Joseph Smithson, Ltd., India Buildings, Halifax, Yorks., Chemist.
1901. Milroy, Andrew, 48, Dinmont Road, Crossmyloof, Glasgow, Manager.
1895. Miner, Harlan S., c/o Welsbach Light Co., Gloucester City, N.J., U.S.A., Technical Chemist.
1889. Miniati, T., Penketh, near Warrington, Chemist.
1904. Minor, John C., Jun., Saratoga Springs, N.Y., U.S.A., Manufacturer.
1895. Mitchell, Chas. A., c/o Beaufoy and Co., South Lambeth Road, S.W., Analyst.
1901. Mitchell, Frank H., c/o Dill and Collins, Richmond and Toga Streets, Philadelphia, Pa., U.S.A., Tutor in Chemistry.

1898. Mitchell, G. D. H., c/o S. S. White Dental Manufacturing Co., Prince's Bay, Staten Island, N.Y., U.S.A., Chemist.
1883. Mitchell, J. W., Plantation House, Clough Fold, near Manchester, Waste Bleacher.
1904. Mitsugi, R., Engineering College, Imperial University, Tokyo, Japan, Chemist.
- O.M. Mitting, E. K., 43, Highfield South, Rock Ferry, Cheshire, Technical Chemist.
1900. Mixner, Albert F., c/o Homeward Bound G. M. Co., Yalwal, Nowra, N.S.W., Australia, Metallurgist.
1895. Moale, Dr. Philip R., c/o Asheville Printing Co., 3, West Court Square, Asheville, N.C., U.S.A., Analytical Chemist.
1902. Möckel, Heinrich A., Bockwa, Post Cainsdorf, Saxony, Chemist and Engineer.
1903. Mühlau, Prof. Dr. Rd., Semperstrasse 4, Dresden, A., Germany, Professor of Colour Chemistry.
1905. Modi, E. M., Opposite Grant Road Station, Sleater Road, Bombay, India, Manufacturing and Analytical Chemist.
- O.M. Mohr, Dr. B., 69A, Parliament Hill, Hampstead, N.W., Consulting Chemist and Metallurgist.
1894. Mole, Herbert B., The Croft, Shepton Mallet, Somerset, Brewer.
1902. Molesworth, F. H., 46, West Street, North Sydney, N.S.W., Australia, Analytical Chemist.
1903. Mommers, Richard, c/o Illinois Sugar Refining Co., Taylor Street and the River, Chicago, Ill., U.S.A., Chemical Engineer.
1889. Mond, Emile S., 20, Hyde Park Square, London, W., Technical Chemist.
- O.M. Mond, Dr. L., F.R.S., 20, Avenue Road, Regent's Park, N.W.; and 64, Via Sistina, Rome, Alkali Manufacturer.
1891. Mond, Robert L., Winnington Hall, Northwich, Chemist.
1890. Moodie, Wm. E., Alexandria Works, Alexandria, N.B., Analytical Chemist.
1901. Moody, Chas. J., Lake View Consols Mine, Boulder, West Australia, Analyst and Assayer.
1905. Moody, Dr. Gerald T., Lohne House, North Dulwich, S.E., Lecturer on Chemistry.
1898. Moody, Dr. Herbert R., Hobart College, Geneva, N.Y., U.S.A., Science Instructor.
1884. Mook, Chas., 2, Kapellenstrasse, Eisenach, Germany, Alkali Works Director.
1903. Mooney, F. M., 118, Pembroke Road, Dublin, Chemical Manure Manufacturer.
1903. Mooney, Geo. A., 2716, St. Catherine Street, Montreal, Canada, Chemical Merchant.
1902. Mooney, Luke, 36, West 52nd Street, Bayonne, N.J., U.S.A.
1887. Moore, Chas. C., 33, Clarendon Road, Garston, Liverpool, Chemist.
1901. Moore, Chas. W., 38, Demesne Road, Whalley Range, Manchester, Chemical Student.
1902. Moore, Fred., Victoria Chemical Co., Ltd., Victoria, B.C., Canada, Manufacturing Chemist.
1892. Moore, Dr. Geo. D., 201, Salisbury Street, Worcester, Mass., U.S.A., Professor of Chemistry.
1902. Moore, Jas. H., Saltville, Va., U.S.A., Chemist.
1899. Moore, Quintin, Jun., Dalmarnock Chemical Works, 89, Rumpfod Street, Glasgow, Works Manager.
1899. Moore, Dr. Russell W., 47, Linden Place, Orange, N.J., U.S.A., Chemist (U.S. Appraiser's Office).
1885. Moore, R. T., 142, St. Vincent Street, Glasgow, Mining Engineer.
1890. Moore, Thos., Laboratoire du Service Local, Noumea, New Caledonia, Analytical Chemist.
1903. Moorhouse, J. B., Cecil Mount, Park Avenue, Bradford, Yorks., Dyer.
1905. Moorwood, F. Colin, c/o Flockton, Tompkin and Co., Ltd., Newhall Steelworks, Sheffield, Steel Manufacturer.
1903. Moran, Geo. A., 333, Haverhill Street, Lawrence, Mass., U.S.A., Chemist.
1890. Mordle, F. Dare, Guilderoy, Matlock Bath, Derbyshire, Starch Manufacturer.
1902. More, Andrew, 19, Ryecroft Street, Fulham, S.W., Government Analyst.
1901. Morgan, Dr. Gilbert T., Royal College of Science, South Kensington, S.W., Demonstrator of Chemistry.
1890. Morgan, J. Jas., Laboratory, Cammell, Laird and Co., Workington, Cumberland, Assayer.
1898. Morgan, Thos. M., Longue Pointe, near Montreal, Canada, Manufacturer.
1885. Morgans, Thos., 60, Queen Square, Bristol, Civil Engineer.
1902. Morison, Jas., Colonial Sugar Refining Co., Ltd., O'Connell Street, Sydney, N.S.W., Australia, Analytical Chemist.
1897. Morison, Samuel L., 15, Broad Street, New York City, U.S.A., Water Engineer.
- O.M. Moritz, Dr. E. R., 45, Great Tower Street, London, E.C., Brewing Chemist.
1885. Morley, Dr. H. Forster, 5, Lyndhurst Road, Hampstead, N.W., Professor of Chemistry.
1903. Morningstar, Jos., 48, Park Place, New York City, U.S.A., Merchant.
1902. Morrell, Dr. R. S., Gonville and Caius College, Cambridge, Lecturer.
1884. Morrice, Jas. A., 1, Prince's Terrace, Dowanhill, Glasgow, Starch and Gum Manufacturer.
1898. Morris, Edgar F., Grey House, Barrington Road, Altrincham, Cheshire, Research Chemist.
1897. Morris, Harry, Avenue House, Doncaster, Chemical Merchant.
1890. Morris, Herbert N., Gorton Brook Chemical Works, Manchester, Technical Chemist.
- O.M. Morris, J. Haydn, York House Hotel, 32, Rua Janellas Verdes, Lisbon, Portugal, Technical Chemist.
1902. Morrison, Jos., Wellfield, Farnworth, Widnes, Manager.
1901. Morse, Willard S., Apartado A., Aguascalientes, Mexico, Assistant Manager.
- O.M. Morson, T., 14, Elm Street, Gray's Inn Road, London, W.C., Manufacturing Chemist.
1904. Morson, Thos. D., c/o T. Morson and Son, Summerfield Works, Ponders End, N., Chemist.
1889. Morton, Jas., Dalguhurn Works, Renton, N.B., Dyeworks Manager.
1897. Morton, Jno., North Road, St. Helens, Lancashire, Analytical Chemist.
1902. Mosbaugh, F. R., c/o Huntsville and Bracebridge Tanning Co., Huntsville, Ont., Canada, Chemist.
1888. Mosenthal, Henry de, 220, Winchester House, Old Broad Street, E.C., Explosives Company Manager.
1903. Moses, Herbert B., Berkely Hotel, Buffalo, N.Y., U.S.A., Electro-Chemist.
1903. Mosher, Walter R., 1274, West Avenue, Buffalo, N.Y., U.S.A., Chemist.
1905. Moss, Wm., Moss Chemical Manufacturing Co., 11-15, Carlaw Avenue, Toronto, Canada, Ammonia Manufacturer.
1894. Moszczenski, J. von., Tartar Chemical Co., Ninth Street and Gowanus Avenue, Brooklyn, N.Y., U.S.A., Consulting Chemist.
1897. Motion, Jno., c/o Valvoline Oil Co., Edgewater, N.J., U.S.A., Oil Refinery Chemist.
1887. Moul, Frank, Aldersgate Chemical Works, Southall, Technical Chemist.
1901. Moule, Jno. W., Sulphide Corporation, Ltd., Cockle Creek, N.S.W., Metallurgical Chemist.
1884. Moul, J., Underhill, Low Fell, Gateshead-on-Tyne, Secretary.
1898. Moulton, Prof. Chas. W., Vassar College, Poughkeepsie, N.Y., U.S.A., Professor of Chemistry.
1892. Mount, Edw., Oaklands, Aughton, near Ormskirk, Assistant Secretary (United Alkali Company).
1905. Mrazsek, F. M., 29, Mincing Lane, London, E.C., Consulting Chemist.
1904. Muckenfuss, Anthony M., State University, Fayetteville, Ark., U.S.A., Professor of Chemistry.
- O.M. Muir, J.P., 233, Camden Road, London, N., Chemist.
1890. Muir, Jas. Stanley, 8, Westminster Gardens, Galsgow, W., Chemist.
1894. Muir-Smith, W., c/o A. B. Fleming and Co., Ltd., Caroline Park, Edinburgh, Oil Works Manager.

1904. Mukerjee, Dr. S. C., Imperial Pharmacy, Unballa Cantonment, Punjab, India, Pharmacist.
- O.M. Müller, Dr. H., F.R.S., 13, Park Square East, Regent's Park, London, N.W., Research Chemist.
1896. Mundy, Lionel, 27, Merton Road, Kensington, W., Importer of Underment Wines.
1887. Munroe, Prof. Chas. E., George Washington University, Washington, D.C., U.S.A., Professor of Chemistry and Dean.
1900. Munsell, Dr. Chas. E., c/o Devor and Reynolds Co., 110, Horatio Street, New York City, U.S.A., Colour Chemist.
1900. Munton, Fred. T., Beaconsfield, Western Road, Runcorn, Cheshire, A.R.S.M., Analytical Chemist.
1897. Murch, D. Wilshin, 6, Victoria Road, Wednesbury, Staffs., Chemist.
1904. Murdoch, Alexander, Park Terrace, Brighton, Polmont Station, N.B., Analytical Chemist.
1886. Murdoch, R. H. M., Shore Road, Stevenston, Ayrshire, Explosives Chemist.
1899. Murphy, Albert J., The Laboratory, 11, Lyddon Terrace, Leeds, Brewer's Chemist.
1901. Murray, Benjamin L., c/o Merck and Co., University Place, New York City, U.S.A., Chemist.
1903. Murray, Chas. B., c/o St. Louis Plate Glass Co., Valley Park, Mo., U.S.A., Chemist.
1899. Murray, Jas. J., Iron King Mines, Val Verde, Arizona, U.S.A., Mining Engineer.
1901. Murray, Jas. P., Toronto Carpet Manufacturing Co., Ltd., King Street and Fraser Avenue, Toronto, Canada, Carpet Manufacturer.
1896. Murray, Dr. Thos. S., 1, Nelson Street, Dundee, Professor of Chemistry.
1898. Murray, Rd., c/o Brotherton and Co., Ltd., Ammonia Works, Holmes Street, Leeds, Analyst.
- O.M. Muspratt, E. K., Seaforth Hall, near Liverpool, Alkali Manufacturer.
1894. Muspratt, Max, 2, Mannering Road, Sefton Park, Liverpool, Technical Chemist.
- O.M. Muspratt, S. K., 9, Church Street, Flint, North Wales, Alkali Manufacturer.
- O.M. Muter, Dr. Jno., Winchester House, Horley, Surrey, Chemical Lecturer.
1895. Muurling, I. J. R., P.O. Box 2160, New York City, U.S.A., Dyestuff Importer.
1903. Myers, Edgar C., New Franklyn, Mo., U.S.A., Agricultural Chemist.
1891. Myers, Wm. S., Nitrate of Soda Propaganda, 12, John Street, New York City, U.S.A., Director.
1903. Nash, A. Douglas, 221, Broadway, Flushing, N.Y., U.S.A., Glass Manufacturer.
1897. Nash, Leonard M., 281, Seven Sisters Road, Finsbury Park, N., Works Chemist.
1900. Nathan, Major Fred. L., R.A., Royal Gunpowder Factory, Waltham Abbey, Essex, Superintendent.
1892. Naylor, Wm. J., Garstang Road, Fulwood, Preston, Lancs., Chemist.
- O.M. Naylor, W. A. H., 38, Southwark Street, London, S.E., Manufacturing Chemist.
1899. Neate, Percy J., "Belsize," Watts Avenue, Rochester, Kent, Director of Cement Co.
1902. Neave, Geo. E., Technical College, 201, George Street, Glasgow, Assistant to Professor of Chemistry.
1905. Needham, Edward R., 18, Paton Street, Glasgow, Manufacturing Chemist.
1905. Needham, Geo., 51, Queen Elizabeth Street, London, S.E., Druggist's Manager.
1898. Neil, Jas. Millar, Farnham Avenue, Deer Park P.O., Toronto, Canada, Technical Chemist.
1890. Neill, Geo. D., Drumslea, Greenock, N.B., Sugar Refiner.
1898. Neilson, Alex. McG., (Journals), P.O. Box 615, Durban, Natal; and (subscriptions) c/o W. Neilson, 42, Brisbane Street, Greenock, N.B., Analytical Chemist.
1889. Neilson, Thos., Highland Boy Smelter, Murray, Utah, U.S.A., Metallurgical Chemist.
1903. Neiman, Howard S., 122, Hudson Street, New York City, U.S.A., Manufacturing Chemist.
1902. Neishi, Arthur C., Columbia University, New York City, U.S.A., Chemist.
1898. Nelson, Elzathan K., c/o Link and Nelson, Paris, Ill., U.S.A., Chemist.
1897. Nelson, Walter, Emscote Mills, Warwick, Gelatin Manufacturer.
1902. Nesbitt, Dr. Beattie, 71, Grosvenor Street, Toronto, Canada, Physician.
1901. Neufville, Dr. Rudolf de, c/o Metallurgische Gesellschaft, Frankfurt a. M., Germany.
1902. Neumann, Dr. Edgar, 60, Chancery Lane, London, W.C.
1903. Neumann, Dr. Max, Hohenstaufenstrasse 32, Berlin, W. 30, Germany.
- O.M. Newall, F. S., Washington, Co. Durham, Chemical Manufacturer.
1905. Newall, Joseph, 28, Greenway Road, Runcorn, Cheshire, Chemist.
1889. Newberry, Spencer B., Sandusky Portland Cement Co., Sandusky, Ohio, U.S.A., Manager.
1896. Newcomen, Thos., Chemical Works, Lydbrook, near Ross, Wood Distiller.
1904. Newgass, Solomon, 257, West 132nd Street, New York City, U.S.A., Student.
- O.M. Newlands, B. E. R., 2, St. Dunstan's Hill, London, E.C., Analytical and Consulting Chemist.
- O.M. Newlands, W. P. R., 232, Amesbury Avenue, Streatham Hill, S.W., Sugar Chemist.
- O.M. Newton, Jno., Manor Works, Rotherhithe New Road, London, S.E., Manure Manufacturer.
1900. Newton, Dr. Wm., 39, Mining Lane, London, E.C., Chemist.
1901. Nibelius, Axel W. T., American Forcite Powder Manufacturing Co., Landing, N.J., U.S.A., Chemist.
1904. Nichols, C. W., 406, Clinton Avenue, Brooklyn, N.Y., U.S.A., Manufacturing Chemist.
1884. Nichols, J. A., Stanley Mount, New Mills, near Stockport, Teacher of Science.
1888. Nichols, Wm. H., 25, Broad Street, New York City, U.S.A., Chemical Manufacturer.
1897. Nicholson, Harry, St. David's Gold Mine, Bontddu, Dolgelly, North Wales, Assayer.
1904. Nicholson, Wilfred E., Hunslet Chemical Works, Leeds, Chemical Manufacturer.
1897. Nicholson, Wm. J., Ardeer, Stevenston, Ayrshire, N.B., Chemist.
1897. Nickel, Herman, c/o The N. K. Fairbank Co., 3rd and Convent Streets, St. Louis, Mo., U.S.A., Chemist.

N

1888. Nickolls, John B., The Laboratory, Grange, Guernsey, Analytical Chemist.
- O.M. Nicol, Dr. W. W. J., 15, Blacket Place, Edinburgh, Chemical Lecturer.
1903. Nicoll, Frank, 221, Walmersley Road, Bury, Lanes., Chemist.
1900. Nield, J. H., c/o General Chemical Co., P.O. Box 8, Hudson Heights, N.J., U.S.A., Superintendent.
1898. Nightscales, Geo., 13, Spring Street, Hull, Oil Merchant.
1899. Nihoul, Dr. Edw., Wareme, Belgium, Director of the Liège Tannery School.
- O.M. Nimmo, Jas., Penshurst, 8, Lawrence Road, South Norwood, S.E., Analytical Chemist.
1885. Nishigawa, T., Ryuso Kaisha, Osaka, Japan, Director of Sulphuric Acid and Soda Works.
1898. Nishikawa, T., c/o Nippon Seimikaisha, Onoda, Nagato, Japan, Chemist.
1904. Noake, Frank, S. S. Mond Gas Co., Trindle House, Dndley, Chief Engineering Assistant.
- O.M. Nolting, Dr. E., Ecole de Chimie, Mulhouse, Alsace, Germany, Professor of Chemistry.
- O.M. Norman, F. J., Lyndhurst, Higher Runcorn, Cheshire, Chemical Manufacturer.
1900. Norman, Geo. M., 929, University Avenue, Madison, Wis., U.S.A., Chemist.
1892. Norman, J. T., 23, Leadenhall Street, London, E.C., Consulting Chemist.
1898. Norris, Albert P., 760, Massachusetts Avenue, Cambridgeport, Mass., U.S.A., Assistant Chemist.
1904. Norris, Cassius W., 612, Commerce Street, Milwaukee, Wis., U.S.A., Tannery Chemist.
1899. Norris, Geo. L., Standard Steel Works, Burnham, Mifflin Co., Pa., U.S.A., Chemist.
1893. Norris, Wm. M., Princeton, N.J., U.S.A., Leather Chemist.
1902. North, Barker, Glenholme, Glenholme Road, Man-ningham, Bradford, Lecturer in Chemistry.
1890. North, E. Gordon N., Technical Chemist.
1903. North, Henry A., 649, Green Avenue, Brooklyn, N.Y., U.S.A., Chemist.
- O.M. Northing, J., The Murrrough, Wicklow, Ireland, Technical Chemist.
1905. Norton, F. A., Brookings, S. Dak., U.S.A., Instructor in Chemistry, South Dakota Agricultural College.
- O.M. Norton, Dr. S. A., 363, East Town Street, Columbus, Ohio, U.S.A., Professor of Chemistry (Ohio State University).
1887. Norton, Dr. T. H., U.S. Consulate, Mezereh, Mamouret-ul-Aziz, Turkey-in-Asia, open Mail, via Constantinople, Ph.D., Sc.D., U.S. Consul.
1901. Novarine, John L., 79, Main Street, Brooklyn, N.Y., U.S.A., Chemist.
1899. Noyes, Henry, c/o J. C. Lanyon and Sons, Gresham House, London, E.C.; and (Journals), 17, Queen Street, Melbourne, Vic., Australia, Engineer.
1901. Noyes, Dr. Wm. A., Melrose Street, Chevy Chase, Md., U.S.A., Editor (J. Amer. Chem. Society).
1884. Oehler, K., Offenbach-am-Main, Germany, Colour Manufacturer.
1888. Ogata, Saburo, Zohei Shikyoku, Okurasho, Tokyo, Japan, Assayer.
1901. Ogden, Richard L., Room 21, P.O. Building, Harrisburg, Pa., U.S.A., Chemist (U.S. Navy).
1896. Ogilvy, D. J., Gest Street and C. H. and O. R. R., Cincinnati, Ohio, U.S.A., Manufacturing Chemist.
1902. Oglesby, Wm. R., c/o Alma Cement Co., Wellston, Ohio, U.S.A., Chemist.
1901. Ogston, Alex. G., Ardoo, near Aberdeen, N.B., Soap Manufacturer.
1903. Ohlenschlager, J. G., jun., 2, Fowkes Buildings, Great Tower Street, London, E.C., Chemical Merchant.
1903. Oldham, E. W., St. Louis Portland Cement Co., St. Louis, Mo., U.S.A., Chemist.
1884. Oliver, F., 31, Horsley Hill Road, Westoe, South Shields, Analytical Chemist.
1902. Oliver, Frank M., 755, North 38th Street, Philadelphia, Pa., U.S.A., Manufacturing Chemist.
1888. Oliver, Wm. Letts, 101, Vernon Street, Oakland, Cal., U.S.A., Mining Engineer.
1901. Olivier, Dr. Louis, 22, Rue du Général-Foy, Paris, S., Directeur (Revue Générale des Sciences).
1905. Ollenbach, D. S., Cordite Factory, Aruvankad, Nilgiris, India, Assistant Government Surgeon.
- O.M. Ollerenshaw, S., 96, Davyholme Lane, Urmston, Manchester, Technical Chemist.
1904. Olney, L. A., 118, Riverside Street, Lowell, Mass., U.S.A., Professor of Chemistry and Dyeing.
1903. O'Loughlin, C. C., c/o Pittsburg Reduction Co., Niagara Falls, N.Y., U.S.A., Analyst.
1904. Olshusen, B. A., 1505, St. Andrew's Place, Los Angeles, Cal., U.S.A., Student.
1899. Olsson, Gustav, c/o Hecla Compressed Gas Co., West 3rd Street, Chelsea, Mass., U.S.A., Manufacturing Chemist.
1902. O'Neill, Chas., (Journals) c/o British Dyewood and Chemical Co., Bury, and (communications) 230, Walmersley Road, Bury, Lanes., Chemist and Colourist.
- O.M. O'Neill, E. H., Johnson's Saccharum Co., Limited, Stratford, London, E., Managing Director.
1898. Ormerod, Ernest, Pestalozzi Strasse 24ⁿ, Zurich V, Switzerland, Chemical Student.
1894. Ormerod, John, Globe Leather Works, Castleton, Manchester, Tanner and Currier.
- O.M. Orr, A., 35A, Bligh Street, Sydney, New South Wales, Analytical Chemist.
- O.M. Orr, J. B., Chestnut Lodge, Widnes, Lancashire, Chemical Manufacturer.
1884. Orr, Robert, c/o Jas. Miller, Son and Co., 79, West Nile Street, Glasgow; and (Journals), Kinnaird, Larbert, N.B., Manufacturing Chemist.
1899. Orr, Thos. W., Esperanza Nitrate Co., Taltal, Chile, Chemist.
1890. Orsman, Wm. Jas., Chemical Laboratory, Gathurst, near Wigan, Explosives Chemist.
1897. Osborne, Thos. B., P.O. Box 485, New Haven, Conn., U.S.A., Chemist.
1900. Osbourne, Jno. P., 572, Alexandra Parade, Dennistoun, Glasgow, Analytical Chemist.
1896. Osmond, Jno. H., c/o Smith, Bell, and Co., Manila, Philippines, Sugar Chemist.
1900. O'Shaughnessy, Francis R., Home Farm, Tyburn, Birmingham, Chemist.
1885. O'Shea, L. T., University College, Sheffield, Chemical Lecturer.
- O.M. O'Sullivan, C. F.R.S., 140, High Street, Burton-on-Trent, Brewer and Chemist.
1883. O'Sullivan, J., High Bank, Burton-on-Trent, Brewing Chemist.
1898. Oushkoff, John P., c/o P. K. Oushkoff and Co., Moscow, Russia, Chemical Manufacturer.
1903. Outwater, Raymond, 1312, B. Street S.W., Washington, D.C., U.S.A., Chemist.
1887. Overtoan, Lord, 7, West George Street, Glasgow, Chemical Manufacturer.
1904. Owen, Halsall, Newholme, Latchford, Warrington, Engineer.

1891. Owens, Caradoc, 88, Great Clowes Street, Lower Broughton, Manchester, Dyer's Manager.
1903. Ozias, Ramon E., 732, Clinton Avenue, Newark, N.J., U.S.A., Assayer.
- P
1904. Packard, C. T., Millbank, Bramford, near Ipswich, Manager of Chemical Works.
- O.M. Packard, E., Jun., Bramford, near Ipswich, Manure Manufacturer.
1899. Paessler, Dr. Joh., Vorstandder Deutschen Versuchsanstalt für Lederindustrie, Freiberg in Sachsen, Germany, Chemist.
1904. Page, Edwin P., Heath Street, Stourbridge, Worcestershire, Chemist.
- O.M. Page, F. J. M., 54, Sutherland Street, Fimbo, S.W., Chemical Lecturer.
1886. Pagès, Albert, 34, Boulevard Henri IV., Paris, Technical Chemist.
1892. Paine, Augustus G., 60, Times Building, and (Journals) 41, Park Row, New York City, U.S.A., President of Paper Making Co.
- O.M. Paine, S., Devisdale, Bowdon, and (Journals) Otter Works, Manchester, Pharmaceutical Chemist.
1902. Pakes, Dr. Walter C. C., Box 1080, Johannesburg, Transvaal, S. Africa, Analyst and Bacteriologist.
1905. Palethorpe, Percy R., The Tobacco Warehousing and Trading Co., 11th and Magnolia Avenue, Louisville, Ky., U.S.A., Chemist and Manager.
1903. Palmenburg, O. W., 107, West 79th Street, New York City, U.S.A., Chemist.
1902. Palmer, Fred. G., c/o Cotton Powder Co., Ltd., Melling, near Liverpool, Analyst.
1887. Palmer, T. Chalkley, Box 19, Chester, Pa., U.S.A., Manufacturing Chemist.
1887. Palmer, Thos. C., Beechwood, Moss Lane, Pinner, Engineer.
1902. Paquin, Felix, Memphis, Tenn., U.S.A., Chemist.
- O.M. Park, J., Millburn Chemical Works, Garngad Hill, Glasgow, Chemical Manager.
1888. Parker, Chas. E., Vine House, Penketh, Warrington, Tanner.
1894. Parker, Chas. E., 151, College Avenue, New Brunswick, N.J., U.S.A., Chemist.
1898. Parker, Charles H., Craigside, Clark Street, Wolverhampton, Chemist.
1891. Parker, Edw., Laburnum House, Rushford Park, Levenshulme, Manchester, Analytical Chemist.
1904. Parker, G. H., c/o Messrs. Haddock, Parker and Co., 14, Chapel Street, Liverpool, Chemical Broker.
1894. Parker, Dr. J. Gordon, Herold's Institute, Drummond Road, Bermondsey, S.E., Head of Tanning School.
1897. Parker, Prof. Matthew A., University of Manitoba, Winnipeg, Canada, Professor of Chemistry.
1901. Parker, Richard H., N.Y. Testing Laboratory, Long Island City, N.Y., U.S.A., Analytical Chemist.
- O.M. Parker, Thos., Manor House, Tettenhall, Wolverhampton, Electrical Engineer.
1894. Parker, Thos. J., 25, Broad St., New York City; and (Journals) Bayonne, N.J., U.S.A., Chemical Works Manager.
1903. Parker, Wm. B., 14, Murray Road, Rugby, Chief Chemist (British Thomson-Houston Co., Ltd.).
1901. Parker, Dr. Wm. Huntington, 177, State Street, Boston, Mass., U.S.A., Chemist (U.S. Appraiser).
1898. Parker, W. W., Whitehouse Street Tannery, Bristol, Tanner.
1901. Parkes, Albert E., 43, Whitehorse Street, Stepney, E., Analytical Chemist.
1905. Parr, Prof. S. W., University of Illinois, Urbana, Ill., U.S.A., Professor of Applied Chemistry.
1904. Parrett, Ben. C., Washington C.H., Ohio, U.S.A., Analyst.
1898. Parrish, Saml., 80, Grange Avenue, Chapeltown Road, Leeds, Teacher of Chemistry.
1896. Parry, John, Ebbw Vale Wharf, Newport, Mon., Analytical Chemist.
1901. Pass, James, Onondaga Pottery Co., Syracuse, N.Y., U.S.A., Pottery Manufacturer.
1902. Patch, Prof. Jas. A., Syrian Protestant College, Beirut, Syria, Professor of Chemistry.
1902. Patchett, Isaac, 11, Field Hill, Batley, Yorks., Science Master.
1897. Patchett, Jas., Oakworth, Hadley, Wellington, Salop, Ironmaster.
1901. Paterson, David, Leadbank, Rosslyn, Midlothian, Colour Chemist.
1884. Paterson, John, Belle Isle Place, Workington, Cumberland, Mechanical Engineer.
1887. Paton, J. M. C., Messrs. Manby, Abbott and Co., Ltd., Nottingham, Mechanical Engineer.
1886. Paton, W. Grant, 18, Bertram Road, Liverpool, Alkali Works Manager.
1901. Patterson, Chas. A., 59, High Street, Woodbury, N.J., U.S.A., Analytical Chemist.
1903. Patterson, E. V., University Club, Baltimore, Md., U.S.A., Textile Colonist.
- O.M. Patterson, Geo., c/o The Manbré Saccharine Co., Ltd., Fulham Palace Road, Hammersmith, W., Technical Chemist.
1893. Patterson, Harry J., College Park, Prince George's Co., Md., U.S.A., Agricultural Chemist.
- O.M. Patterson, T. L., Maybank, Finnart Street, Greenock, N.B., Sugar Works Manager.
1902. Patterson, Wm. Hamilton, Chem. Techn. Laboratorium, Hochschule, Karlsruhe i. B., Germany.
- O.M. Pattinson, J., 10, Dean Street, Newcastle-on-Tyne, Consulting Chemist.
- O.M. Pattison, Jas., Drummamona, Kilmacolm, N.B., Chemical Merchant.
1889. Pattison, Percy, J., 5, Kingsley Road, Forest Gate, E., Technical Chemist.
1904. Patz, E. O., 215, Water Street, New York City, U.S.A., Manager, Berlin Aniline Works.
1891. Paul, Jas., H., 19, Glenhuc Road, Blackheath, S.E., Analytical Chemist.
1900. Paul, Dr. L. Gordon, Market Hall Chambers, King Street, Huddersfield, Consulting Chemist.
1902. Pay, Walter Herbert, Government Laboratory, Durban, Natal, S. Africa, Chemist and Assayer.
1904. Payne, A. G. C., 15, Lanyon Road, Queen's Road, Peckham, S.E., Assistant Works Chemist.
- O.M. Payne, J. B., 15, Mosley Street, Newcastle-on-Tyne, Manufacturing Chemist.
1898. Pearce, Edw. D., Messrs. T. P. Shepard and Co., P.O. Box 1336, Providence, R.I., U.S.A., Manufacturing Chemist.
1894. Pearce, Jas. Stanley, Clements, Snaresbrook, Essex, Chemical Manufacturer.
1897. Pearce, Richard, Argo, Colo., U.S.A., Smelting Works Manager.
1903. Pearce, Sidney H., P.O. Box 149, Johannesburg, Transvaal, South Africa, Metallurgist.
1883. Pearce, W., Chemical Works, Bow Common, London, E., Chemical Manufacturer.
1903. Percy, A. C., 27, St. Kilda's Road, Stoke Newington, N., Director, Explosives Co.
1903. Pears, Thos., The Laboratory, Soap Works, Isleworth, Soap Manufacturer.
1893. Pearson, Frank P., 178, Pawtucket Street, Lowell, Mass., U.S.A., Printworks Manager.
1894. Pearson, Wm. H., 6, Fenchurch Buildings, London, E.C., Analytical Chemist.
1904. Pease, Fred. N., 345, East 33rd Street, New York City, U.S.A., Chemist.
- O.M. Pechiney, A. R., Les Rochers, Hyères (Var), France, Chemical Engineer.
1898. Peek, Dr. Ernest L., Claremont, Merrilocks Road, Blundellsands, near Liverpool, Chemist.
1898. Peckham, Stephen F., Room 104, 280, Broadway, New York City, U.S.A., Chemist.
1894. Peden, Jno., 30, Ardgowan Street West, Greenock, N.B., Analytical Chemist.
- O.M. Pedler, Prof. A., C.I.E., F.R.S., Writer's Buildings, Calcutta, India, Director of Public Instruction.

1886. Pedler, J. R., 47, Tregunter Road, South Kensington, S.W., Clerk.
1905. Peet, Wm. J., Stockyards Station, Kansas City, Kas., U.S.A., Superintendent.
1903. Peiffer, Harry C., c/o Pittsburgh Reduction Co., East St. Louis, Ill., U.S.A., Manufacturing Chemist.
1899. Pell, A., 7, Elphinstone Circle, Bombay, India, Chemist.
1897. Pellew, Chas. E., Columbia University, New York City, U.S.A., Adjunct Professor of Chemistry.
1904. Pelly, Russell George, 63, Rowan Road, Brook Green, Hammersmith, W., Analytical Chemist.
1896. Penney, Mulgrave D., 11, High Street, Hull, Analytical Chemist.
1903. Pennington, R. W. R., "Carbonic," Mazagon, Bombay, India, General Manager and Engineer (Sirdar's Carbonic Acid Co. Ltd.).
1904. Pennington, Thos., Platteville, Wis., U.S.A., Chemist.
1890. Pennock, J. D., c/o Solvay Process Co., Syracuse, N.Y., U.S.A., Technical Chemist.
1885. Pentecost, S. J., Nottingham Road, New Basford, and (Journals), Sherwood Hill Works, Sherwood Rise, Nottingham, Lace Dresser.
1887. Pentermann, H. F., 37, Clifton Crescent, Peckham, S.E., Brewing Chemist.
1892. Peploe, D. H. T., Underriver House, Sevenoaks, Kent.
1899. Peppel, S. Vernon, 431, Main Street, Louisville, Ky., U.S.A., Chemist.
1885. Perkin, A. G., F.R.S., 8, Montpelier Terrace, Hyde Park, Leeds, Technical Chemist.
1898. Perkin, Dr. F. Mollwo, Borough Polytechnic Institute, Borough Road, S.E., Head of Chemical Department.
- O.M. Perkin, Dr. W. H., F.R.S., The Chestnuts, Sudbury, Harrow, Research Chemist.
1887. Perkin, Dr. W. H., Jun., F.R.S., Fairview, Wilbraham Road, Fallowfield, Manchester, Professor of Chemistry.
1903. Perkins, Frank G., Planters' Manufacturing Co., 192, Fulton Street, New York City, U.S.A., Starch Manufacturer.
1893. Perkins, T. S., 155, Bushkill Street, Easton, Pa., U.S.A., Chemist.
1899. Perks, Walter G., (Journals) Glanafon, and (communications) c/o National Explosives Co. Ltd., Hayle, Cornwall, Manufacturer.
1904. Perrott, Bert, County School, Neath, Glamorgan, Demonstrator in Chemistry.
1901. Perry, Chas. M., 4, Catalpa Road, Providence, R.I., U.S.A., Bleach and Dyeworks Chemist.
1887. Perry, D., Norwood, Lenzie, N.B., Manufacturing Chemist.
1895. Perry, Jos. H., 276, Highland Street, Worcester, Mass., U.S.A., Teacher of Chemistry.
1903. Perry, M. J. T., Australian Drug Co., O'Connell Street, Sydney, N.S.W., Australia, Manufacturing Chemist.
1903. Perry, Robt. Swain, c/o Harrison Bros. and Co., Inc., 35th Street and Grays Ferry Road, and (Journals) Station D., Philadelphia, Pa., U.S.A., President.
1901. Persons, Ashton C., 315, Prospect Street, Williamantic, Conn., U.S.A., Chemist.
1897. Peter, Dr. A. H., c/o Zinsser and Co., Hastings-on-Hudson, N.Y., U.S.A., Chemist.
1893. Pethybridge, Walter, 3, Rhodesia Road, Clapham Rise, S.W., Chemist and Assayer.
1903. Petrie, Jas. M., The University, Sydney, N.S.W., Australia, Chemist.
1902. Petsche, B. W., 25, Fairview Street, Yonkers, N.Y., U.S.A., Chemist.
1883. Pettigrew, J., 6, St. Helen's Place, Bishopsgate, London, E.C., Technical Chemist.
1892. Pettigrew, Robt., c/o Mersey and Irwell Joint Committee, 44, Mosley Street, Manchester, Electro-Chemist.
1902. Pettitt, Alf., 3421, Avenue G, Flatbush, N.Y., U.S.A., Chemist.
1904. Petty, Gordon N., 566, Stretford Road, Old Trafford, Manchester, Technical Chemist.
1905. Peuchot, A., 129, Crosby Street, New York City, U.S.A., Chemical Manufacturer.
1904. Peyser, Horace F., 68, West 47th Street, New York City, U.S.A., Chemist.
- O.M. Peyton, E. P., Chemical Works, Lister Street, Birmingham, Chemical Manufacturer.
1900. Peyton, Wm. C., c/o Peyton Chemical Co., Room 30, 4th Floor, Mills Building, San Francisco, Cal., U.S.A., Chemist.
1904. Pfahler, H. W., 208, Linden Street, Holyoke, Mass., U.S.A., Chemist.
1888. Philip, Arnold, Chemical Laboratory, H.M. Dockyard, Portsmouth, Electro-Metallurgist and Electrical Engineer.
1903. Philipp, Herbert, 84, High Street, Perth Amboy, N.J., U.S.A., Chemist and Electrochemical Engineer.
1886. Phillips, A. G., 11, Essex Villas, Phillimore Gardens, Kensington, W., Barrister-at-Law.
1904. Phillips, Edw. W., c/o Fairmont Coal Co., Fairmont, W. Va., U.S.A., Chemist.
1891. Phillips, G. Brinton, (Journals) 622, Race Street; and (communications) 2007, De Lancey Place, Philadelphia, Pa., U.S.A., Manufacturing Chemist.
- O.M. Phillips, Harcourt, Lynwood, Turton, Lancs., Analytical Chemist.
1895. Phillips, S. Chas., 47, Cannon Street, London, E.C., Chemical Engineer.
1904. Phillips, V. C., Haselmere, Morris Avenue, Manor Park, E., Chemist.
1898. Phillips, Wm. H., 100, Milton Avenue, East Ham, E., Soapmakers' Assistant.
1883. Phipson, Dr. T. L., Casa Mia, Putney, S.W., Analytical and Consulting Chemist.
1894. Picard, Hugh F. K., 44, London Wall, London, E.C., Metallurgist.
- O.M. Pick, Dr. S., Direction der Soda Fabrik, Szczakowa, Galizien, Austria, Chemical Engineer and Manager.
1904. Pickard, Glenn H., Susquehanna Dyeworks, Williamsport, Pa., U.S.A., Chemist.
1905. Pickard, Greenleaf W., American Telegraph and Telephone Co., 125, Milk Street, Boston, Mass., U.S.A., Electrical Engineer.
1902. Pickard, R. H., Merlin Road, Blackburn, Teacher and Analyst.
1897. Pickert, Leo, W., American Sugar Refining Co., Granite Street, South Boston, Mass., U.S.A., Chemist.
1904. Pickett, Chas. E., 26, East 23rd Street, Bayonne, N.J., U.S.A., Superintendent, Borax Refinery.
1904. Pickup, Edgar H., 348, Great Clowes Street, Higher Broughton, Manchester, Calico Printer.
1899. Pidduck, E. W., University College of Wales, Aberystwith, Wales, Assistant Chemist.
1901. Pierce, Ira L., c/o Atlantic Manufacturing Co., Washburn, Wis., U.S.A., Chemist.
1897. Pilhashy, Benj. M., Town and 4th Streets, Columbus, Ohio, U.S.A., Chemist.
1888. Pilkington, G., 263, Walmersley Road, Bury, Lancashire, Analytical Chemist.
1893. Pilley, Thos. W., 33, Grove Hill Road, Denmark Hill, S.E., Analytical Chemist.
1894. Pilling, John E., Agnew Villas, 78, Whitegate Drive, Blackpool, Chemist.
1883. Pipe, Jas., Messrs. Wm. Henderson and Co., Irvine, N.B., Chemical Manufacturer.
1896. Piper, Walter E., Boston Rubber Shoe Co., Malden, Mass., U.S.A., Chemist.
1905. Pirie, Frank D., Stonewood Works, Bucksburn, Aberdeenshire, Paper Manufacturer.
1900. Pitman, Jno. R., c/o Lafin and Rand Powder Co., Haskell, N.J., U.S.A., Chemist.
- O.M. Pitt, T., 16, Coleman Street, London, E.C., Manufacturing Chemist.
1902. Pittard, Jno., 30, Mansfield Road, Ilford, Essex, Chemical Manufacturer.
1905. Pittock, C. K., Baithney Estate, Saklaspur, Hassan, India, Coffee Grower and Chemist.

1884. Pittuck, F. W., 15, Stratford Grove, Heaton, Newcastle-on-Tyne, Technical Chemist.
1899. Pizey, Jas. H., Anchor Chemical Works, Provam-mill, Glasgow, Chemist.
1894. Platten, Frank, 15, Barnsley Road, Edgbaston, Birmingham, Metallurgical Chemist.
1890. Platts, Jno. C., Heaton Moor Lodge, Heaton Chapel, near Stockport, Metallurgical Chemist.
1896. Plaut, Albert, 128, William Street, New York City, U.S.A., Wholesale Druggist.
1888. Playfair, David J., 7, Victoria Crescent, Dowanhill, Glasgow, Manufacturing Chemist.
1891. Pocklington, Hy., 41, Virginia Road, Leeds, Assurance Co.'s Local Manager.
1901. Pollard, Wm., Museum, Jernyn Street, London, S.W., Chemist (I.M. Geological Survey).
1904. Pollitt, Dr. Geo. P., c/o Brunner, Mond, and Co., Northwich, Cheshire, Chemist.
1902. Pollitt, Jas. C. T., c/o Kynoch, Ltd., Wotton, near Birmingham, Manufacturing Chemist.
1893. Pollitt, R. B., De Beers Explosives Works, Somerset West, C.C., South Africa, Civil Engineer.
1883. Pollock, A., Kirkland, Bonhill, Dumbartonshire, Dyeworks Manager.
1890. Pomeroy, Dr. Chas. T., 55, Broad Street, Newark, N.J., U.S.A., Ink Manufacturer.
1896. Pond, Prof. G. G., State College, Centre Co., Pa., U.S.A., Professor of Chemistry.
- O.M. Pond, J. A., 99, Queen Street, Auckland, New Zealand, Analytical Chemist.
1900. Pont, Francis G. du, Montchanin, Del., U.S.A., Manufacturer.
1895. Pont, Pierre S. du, Wilmington, Del., U.S.A., Explosives Manufacturer.
1896. Poole, Herman, 331, West 57th Street, New York City, U.S.A., Manufacturing Chemist.
1892. Pope, Frank, c/o The Dunwoody Bros. Soap Co., Denver, Colo., U.S.A., Chemist.
- O.M. Pope, S., 35, Victoria Road, Runcorn, Chemical Works Manager.
1899. Pope, Thos. H., The University, Birmingham, Chemist.
1900. Pope, Prof. W. J., F.R.S., Municipal School of Technology: and (Journals) 16, Hope Street, Higher Broughton, Manchester, Professor of Chemistry.
1900. Popplewell, Jos. M., c/o Brotherton and Co., Provam Chemical Works, Millerston, Glasgow, Chemist.
1899. Porter, A. Felix, c/o American E. C. and Schulze Powder Co., Oakland, N.J., U.S.A., Chemist.
1896. Porter, Herbert, 89, Lancaster Avenue, Fennel Street, Manchester, Alkali Inspector.
1902. Porter, J. Edw., P.O. Box 785, and 205, W. Genesee Street, Syracuse, N.Y., U.S.A., Chemist.
1901. Porter, Jno. L., New Orleans Sewerage Board, 602, Carondelet Street, New Orleans, La., U.S.A., Chemist.
1904. Portner, Edward G., Robert Portner Brewing Co., Alexandria, Va., U.S.A., Chemist.
1884. Potter, Chas. E., Love Lane Sugar Refinery, Liverpool, Sugar Works Chemist.
1888. Potter, Chas. J., Heaton Hall, Newcastle-on-Tyne, Cement Manufacturer.
- O.M. Potter, E. P., Salwick Hall, near Preston, Alkali Manufacturer.
1899. Potter, Rowland S., 97, Belgrave Road, Hford, Essex, Chemist.
1902. Potts, Cuthbert, Hawkesbury Agricultural College, Richmond, N.S.W., Lecturer in Chemistry.
1900. Potts, Geo. E., Landing, N.J., U.S.A., Explosives Manufacturer.
1902. Potts, Henry Wm., Hawkesbury Agricultural College, Richmond, N.S.W., Australia, Chemist and Principal.
1892. Potts, Joseph T., Price's Patent Candle Co., Brom-boro' Pool, near Birkenhead, Chemist.
1900. Pough, Frank H., c/o T. and S. C. White Co., 28, Burling Slip, New York City, U.S.A., Manager.
1889. Powell, A. Ernest, Crugowan, Clarendon Road, Whalley Range, Manchester, Old Merchant.
1900. Powell, Harry J., 506, Lordship Lane, S.E., Glass Manufacturer.
1884. Powell, L. S., St. John's Cottage, Hildenborough, Tonbridge, Electrician.
1897. Power, Dr. Fred. B., Wellcome Research Laboratories, 6, King Street, Snow Hill, London, E.C., Director.
1902. Powney, Wm. E. F., 9, Lancaster Road, Stroud Green, N., Analytical Chemist.
1900. Pratt, N. P., Laboratory, Atlanta, Ga., U.S.A., Manufacturing Chemist.
1889. Pratt, Walter E., 17, East Road, Lancaster, Ana-lytical Chemist.
1897. Prentice, Dr. Bertram, Royal Technical Institute, Salford, Lecturer on Chemistry.
1902. Prentice, Dr. David, 39, Whitefield Road, Stockton Heath, Warrington, Chemist.
1903. Prentice, Jas., Cossipore Sugar Works, Calcutta, India, Chemist.
1888. Prescott, Dr. Albert B., Ann Arbor, Mich., U.S.A.
1900. Prescott, Saml. C., Mass. Inst. of Technology, Boston, Mass., U.S.A., Instructor in Bacteriology.
- O.M. Price, A. F., 524, Sacramento Street, San Francisco, Cal., U.S.A., Analytical Chemist.
1904. Prichard, Norman B., Capelton, Quebec, Canada, Chemical Engineer.
1904. Prideaux, E. B. R., 17, Barnmead Road, Beckenham, Kent, Student.
1905. Priest, Geo. Wesley, Mansfield, Mass., U.S.A., Manufacturer.
1902. Pringsheim, Dr. H. H., 131, Hilliard Street, Cam-bridge, Mass., U.S.A., Chemist.
1899. Prinseng-Geerlids, H. C., Pekalongan, Java, Nether-lands Indies, Director of Sugar Cane Experi-mental Station.
1893. Pritchard, Edgar J., North Hill, Swansea, Works Manager.
1903. Pritchard, Philip M., Chief Engineer's Office, United Alkali Co., Ltd., Widnes, Engineer.
1896. Prochazka, Dr. Geo. A., 138, West 13th Street, New York City, U.S.A., Colour Manufacturer.
1897. Prochazka, John, c/o Central Dye-stuff and Chemical Co., Newark, N.J., U.S.A., Coal-Tar Colour Chemist.
- O.M. Procter, Prof. H. R., The University, Leeds: and (Journals) Rowangarth, Ben Rhydding, near Leeds, Yorks., Lecturer on Tanning.
1884. Procter, J. W., Skeldergate Bridge, York, Manure Manufacturer.
1890. Procter, Miss Anne J., Free Library, Widnes, Librarian.
- O.M. Proctor, C., 27, London Road, Forest Hill, S.E., Analytical Chemist.
- O.M. Proctor, W. W., 10, The Side, Newcastle-on-Tyne, Assayer and Analytical Chemist.
1901. Propach, C., Apartment G., 1097, North Clark Street, Chicago, Ill., U.S.A., Colour Merchant.
1894. Proude, Jas., 30, Cromwell Terrace, Halifax, Yorks., Soap Works Chemist and Manager.
1899. Pullar, Edmund, Keirfield, Bridge of Allan, N.B., Manufacturer.
1894. Pullar, Herbert S., Pullar's Dyeworks, Perth, N.B., Dyer.
- O.M. Pullar, Sir Robert: Journals to Jas. Craigie, Sande-man Public Library, Perth, N.B., Dyer.
- O.M. Pullar, R. D., Pullar's Dyeworks, Perth, N.B., Dyer.
1903. Pullin, Sydney R., 10, Newton Grove, Chapeltown Road, Leeds, Chemist.
1902. Puntan, H. H. C., 10, London Chambers, Durban, Natal, Public Analyst.
1894. Purdie, Dr. Thos., F.R.S., 14, South Street, St. Andrews, N.B., Professor of Chemistry.
1905. Pyman, Dr. Frank Lee, The Oaks, Hitchin, Herts., Chemist.

Q

1903. Queeny, Jno. F., Monsanto Chemical Works, 1806-1818, South 2nd Street, St. Louis, Mo., U.S.A., Chemical Manufacturer.
1905. Queiroz, Dr. Luiz M. Pinto de, Rua Direita 108, Sao Paulo, Brazil, Manufacturing Chemist.
1903. Queneau, Augustin L., c/o New Jersey Zinc Co., South Bethlehem, Pa., U.S.A., Mining Engineer.
1887. Quibell, Oliver, Shalem Lodge, Newark-on-Trent, Manure Manufacturer.
1902. Quinan, Kenneth B., c/o De Beers Explosives Works, Somerset West, C.C., South Africa, Chemist.
1897. Quinan, Wm. R., (Journals) General Manager, De Beers Explosives Works, Dynamite Factory, Cape Colony, South Africa; and (subscriptions) c/o De Beers Consolidated Mines, 15, St. Swithin's Lane, E.C., Superintendent (Powder Works).
1897. Quirk, Jno. S., Lead Smelting Works, St. Helens, Lancs., Manager.

R

1898. Radcliffe, Lionel G., 6, Alma Terrace, Old Trafford, Manchester, Chemist.
1904. Rademacher, Dr. Ferdinand, Prag-Carolinenthal, Austria, Chemical Manufacturer.
1900. Radley, Ernest G., 49, Ernest Street, West Norwood, S.E.
1895. Raegenier, Louis C., 141, Broadway, New York City, U.S.A., Patent Lawyer.
1901. Ralston, Wm., Government Chem. Laboratory, Lagos, West Africa, Government Chemist.
1902. Ramsay, A. Alexander, Laboratory, Department of Agriculture, 136, George Street, Sydney, N.S.W., Australia, Assistant Chemist.
- O.M. Ramsay, Sir William, K.C.B., F.R.S., University College, London, W.C.; Journals to 19, Chester Terrace, N.W., Professor of Chemistry.
1888. Ramsay, W., c/o Cammell, Laird and Co., Ltd., Birkenhead Ironworks, Birkenhead, Chemist and Assayer.
1898. Ramsden, Andrew, York Villa, Walmersley Road, Bury, Lancs., Sugar Works Manager.
1901. Ransom, Francis, The Chilterns, Hitchin, Herts., Manufacturing Pharmaceutical Chemist.
1904. Rapelje, Walter S., 957, Liberty Avenue, Brooklyn, N.Y., U.S.A., Chemist.
1898. Raschen, Dr. Julius, The Highlands, Runcorn, Cheshire, Consulting Chemist (United Alkali Co.).
1893. Ratcliff, Frank D., The Cottage, Green Hill, Broms-grove, Worcestershire, Vinegar Brewer.
1904. Ratcliffe, C. F., c/o Brotherton and Co., Ltd., Provan Chemical Works, Millerston, Glasgow, Tar Distiller.
1904. Ratcliffe, Mrs. F. A., 111, Croxsted Road, West Dulwich, S.E.
1898. Ratcliffe, Walter, 21, Mawdsley Street, Bolton, Analytical Chemist.
1895. Rau, Dr. H. M., 130-132, Pearl Street, New York City, U.S.A., Chemist.
1901. Rauter, Dr. G., Cauerstrasse, 2, Charlottenburg, 1, bei Berlin, Germany, Engineering Chemist.
1901. Rawlins, Herbert J. L., The Cottage, Rainhill, Lancashire, Managing Director.
1903. Rawolle, Frederick C., c/o Marx and Rawolle, 100 William Street, New York City, U.S.A., Chemist.
- O.M. Rawson, Chris., 44, St. Augustine Road, Bedford, Consulting Chemist.
1883. Rawson, Dr. S. G., Technical Schools, Huddersfield, Analytical Chemist.
1895. Read, E. J., St. Ives, The Avenue, Gravesend, Kent, Analyst.
1890. Reade, Thos., Sebright House, Tettenhall Wood, Wolverhampton, Manufacturing Chemist.
1903. Reading, Richard W., Knight's Deep, Ltd., P.O. Box 143, Germiston, Transvaal, S. Africa, Assayer and Mechanical Engineer.

- O.M. Readman, Dr. J. B., Mynde Park, Hereford, Analytical and Consulting Chemist.
1902. Redfern, C. G., 4, South Street, Finsbury, London, E.C., Patent Agent.
1890. Redgate, J. G., Traffic Street, Nottingham, Aerated Water Manufacturer.
1901. Redpath, Leon W., International Smokeless Powder and Dynamite Co., Parlin, N.Y., U.S.A., Chemist.
- O.M. Redwood, Dr. Boverton, 4, Bishopsgate Street Within, London, E.C., Petroleum Expert.
1884. Redwood, I. L., Bantry House, Picardy Hill, Belvedere, Kent, Technical Chemist.
1887. Redwood, Robt., 4, Bishopsgate Street Within, London, E.C., Secretary.
1891. Redwood, T. Horne, Olveston, Sedlescombe Road, St. Leonard's-on-Sea, Analytical Chemist.
1886. Ree, Dr. A., 15, Mauldeth Road, Withington, Manchester, Aniline Dye Manufacturer.
1884. Reed, Albert E., The Grange, Leigham Court Road, Streatham, S.W., Paper Works Chemist.
1902. Reed, Herbert C., c/o Stamford Manufacturing Co., Stamford, Conn., U.S.A., Chemist.
1895. Reed, Dr. J. Hastings, Hambledon Mill, *via* Cairns, North Queensland, Sugar Manufacturer.
1893. Reekie, J. A., Blackford House, Whitefield, near Manchester, Calico Printer's Colour Mixer.
1883. Reeks, T. H., 106, Queen Victoria Street, London, E.C., Analytical and Consulting Chemist.
1901. Rees, Harold B., c/o Harris-Rees Tanning Co., Sylva, N.C., U.S.A., Tanner and Currier.
1897. Rees, W. H., Big Pine, Inyo Co., Cal., U.S.A., Chemist.
1900. Reese, Dr. Chas. L., c/o Repanno Chemical Co., Chester, Pa., U.S.A., Chemist.
1897. Reid, Andrew, 133, Minard Road, Crossmyloof, Glasgow, Chemist.
1896. Reid, Robt., Oil Mills, Horbury Bridge, near Wakefield, Chemical Student.
1895. Reid, T. Anderson, c/o Johnsen, Jørgensen, and Wettre, 38, Victoria Buildings, Manchester, Works Manager.
- O.M. Reid, Walter F., Fieldside, Addlestone, Surrey, Technical Chemist.
1893. Reid, Wm., Jun., Bombay Dyeworks, Dadur, Bombay, India, Dyer.
1904. Reinherz, Otto, (Journals) 9, Heaton Grove, Bradford, Yorks., and (communications) 181, Cromwell Road, London, S.W., Chemist.
1898. Reitmeyer, Robt. E. D., 63, Crutched Friars, London, E.C., Chemical Merchant.
1901. Remington, J. Percy, jun., 36, Doughty Street, Brooklyn, N.Y., U.S.A., Chemist.
1904. Remington, Prof. Joseph P., 1823, Pine Street, Philadelphia, Pa., U.S.A., Author, U.S. Pharmacopoeia.
1900. Remington, J. Stewart, Aynsome, Grange-over-Sands, R.S.O., Lancs., Consulting Chemist.
1903. Remsen, President Ira, Johns Hopkins University, Baltimore, Md., U.S.A., President.
1884. Renaut, F. W., 17, Emanuel Avenue, Friar's Park, Acton, W., Secretary.
- O.M. Rennie, Dr. E. H., University of Adelaide, South Australia, Professor of Chemistry.
- O.M. Remoldson, W. L., c/o United Alkali Co., Ltd., Hebburn-on-Tyne, Manager.
1901. Renwick, Frank F., Hylands, Brentwood, Essex, Chemist (Photographic Works).
1894. Rettie, Theodore, 16, Great King Street, Edinburgh, Metallurgical Chemist.
1895. Reubens, Chas. M., c/o Brady Brass Co., 202, Tenth Street, Jersey City, N.J., U.S.A., Chemist.
1902. Reuterdahl, Arvid, 194, Calla Street, Providence, R.I., U.S.A., Consulting Electrical Chemist.
- O.M. Reynolds, Dr. J. Emerson, F.R.S., 29, Campden Hill Court, Kensington, W., Professor of Chemistry.
1904. Rhett, Edmund, American Ether Co., Richmond, Va., U.S.A., Superintendent.
- O.M. Rhodes, E., c/o Thos. Vickers and Sons, Widnes, Technical Chemist.
1892. Rhodes, Jos., Church Bridge House, Accrington, Print Works Chemist.

1902. Rhodin, B. E. F., Saint Ste. Marie, Ont., Canada, Chemical Engineer.
1889. Richards, Edgar, 16, Lafayette Square, Washington, D.C., U.S.A., Analytical Chemist.
1888. Richardson, Clifford, New York Testing Laboratory, Long Island City, N.Y., U.S.A., Chemical Engineer.
1888. Richardson, D. B., Chemical Merchant.
1903. Richardson, F. J., Chemical Works, Ringsend Docks, Dublin, Ireland, Chemical Manure Manufacturer.
1884. Richardson, F. W., City Analyst's Office, Bradford; and (Journals) Oak Lea, Menston-in-Wharfedale, Yorkshire, Analytical Chemist.
1892. Richardson, G. E., Branch House, Batley, Yorks., Manufacturing Chemist.
1900. Richardson, Jno. H., c/o H. D. Poehin and Co., Ltd., Salford, Manchester, Manager.
1905. Richardson, L. G., c/o E. Ripley and Sons, Ltd., Bowling Dyeworks, Bradford, Yorks., Chemist.
1889. Richardson, S. M., 415, Main Street, Bonhill, N.B., Analytical Chemist.
1891. Richardson, Walter W., Aldingham, Park View Crescent, Roundhay, Leeds, Manufacturing Chemist.
1903. Richardson, Wm., 2, Oakfield Terrace, Headingley, Leeds, Drysalter.
1900. Richardson, Wm. Derrick, 4306, Forestville Avenue, Chicago, Ill., U.S.A., Chemist (Swift and Co.).
1894. Richardson, Wm. H., Newsy Thread Mills, Malaja Bolotnaja, St. Petersburg, Russia, Textile Chemist.
1904. Richardson, Wm. S., 201, High Street, Lincoln, Chemical Manure Manufacturer.
1886. Richmond, H. D., 8, Woodfield Road, Ealing, W., Chief Chemist (Aylesbury Dairy Co.).
1898. Richmond, Jno. R., Stalheim, Ecclestone Park, Prescott, Lancs., Alkali Works Manager.
1901. Richmond, Sylvester O., Royal Victoria Yard, Deptford, London, S.E., Analytical Chemist.
1886. Riddell, R., 87, Horninglow Street, Burton-on-Trent, Brewer.
1894. Ridding, Howard C., School of Mines, Clinton Road, Redruth, Cornwall, Principal.
1884. Rideal, Dr. Samuel, Laboratory, 28, Victoria Street, Westminster, S.W., Consulting Chemist.
- O.M. Ridsdale, C. H., Ferndale, Linthorpe, Middlesbrough, Yorks., Analytical Chemist.
1899. Riederer, Emil J., Forcite Powder Co., Landing, N.J., U.S.A., Chemist.
1902. Riederer, Dr. Herman S., 251, West 95th Street, New York City, U.S.A., Chemist.
1892. Riker, Jno. J., 46, Cedar Street, New York City, U.S.A., Merchant.
- O.M. Riley, E., 2, City Road, Finsbury Square, London, E.C., Metallurgical Chemist.
1902. Riley, Fred., c/o Rhode Island Dyeing and Finishing Co., Woonsocket, R.I., U.S.A., Traveller.
- O.M. Riley, J. E., Arden Hall, near Accrington, Chemical Manufacturer.
1884. Riley, Jno., Mayfield, Thornliebank, near Glasgow, Print Works Manager.
1904. Riley, Oliver, Arden Hall, Accrington; and (Journals) Hapton Chemical Works, near Accrington, Chemical Manufacturer.
1904. Riley, W. A., Brunswick Lodge, Newmarket Road, Norwich, Brewer.
1899. Rink, Arnold, 9, Butler Street, Milton Street, London, E.C., Tannin Extract Manufacturer.
1889. Rintoul, Wm., 4, Sewardstone Road, Waltham Abbey, Essex, Explosives Chemist.
1901. Ripley, Philip F., 48, Central Street, Andover, Mass., U.S.A., Chemist.
1900. Rising, Willard B., Berkeley, Cal., U.S.A., Professor of Chemistry.
1885. Ritson, T. N., 1, West Cliff Villas, West Cliff Road, Ramsgate, Gas Engineer.
1899. Rivington, W. John, 24, Mark Lane, London, E.C., Newspaper Proprietor.
- O.M. Rix, W. P., Frocester House, Kinglake Road, Egremont, Cheshire, Potter.
1890. Roberts, C. E., Ludlits, Delphi, c/o Oldham, Chemical Merchant.
- O.M. Roberts, F. G., Alder, Oak Hill Lodge, Farnham, N.W., Chemical Manufacturer.
1901. Roberts, H. F. C., 11, Albion Terrace, Exeterham, Kent, Chemist (Cotton Powder Co., Ltd.).
1885. Roberts, R. Wightwick, 22, Calle Arturo Prat, Valparaiso, Chili, Analytical and Consulting Chemist.
1900. Roberts, Wm. Brittain, Wilderspool House, Warrington, Brewer and Analyst.
1902. Roberts, Wm. H., 1, Newborough Avenue, Sefton Park, Liverpool, S., Analytical Chemist.
1902. Robertshaw, Chas. D., c/o Chas. Price and Co., Oilworks, Belyddere, Kent, Analytical Chemist.
1891. Robertson, Alex. A., Riversdale, Crossington Park, Liverpool, Technical Chemist.
1897. Robertson, Andrew, J., 17, South 12th Street, Richmond, Va., U.S.A., Analytical Chemist.
1903. Robertson, Fred., 128, Wellington Street, Glasgow, Analytical Chemist.
1900. Robertson, Jas., 103, Whifflet Street, Coatbridge, N.B., Analytical Chemist.
1891. Robertson, Dr. Robt., 9, Sewardstone Road; (Journals) Royal Gunpowder Factory, Waltham Abbey, Essex, Analytical Chemist.
1901. Robertson, Robert, California Powder Works, Santa Cruz, Cal., U.S.A., Superintendent.
1903. Robertson, W. Crum, 15, Commerce Street, Glasgow, Oil Merchant and Importer.
1895. Robins, Walter, Wanstead Cottage, New Wanstead, Essex, Chemist.
1897. Robinson, Clarence J., Westerleigh, West New Brighton, N.Y., U.S.A., Chemist.
1900. Robinson, Edw. B., Victoria Oil Works, Nitshill, near Glasgow, Oil Distiller.
1904. Robinson, Prof. Franklin C., Bowdoin College, Brunswick, Maine, U.S.A., Professor of Chemistry.
1902. Robinson, Hy. Fishwick, Culcheth Chemical Works, Newton Heath, Manchester, Manufacturing Chemist.
- O.M. Robinson, H. H., 75, Finborough Road, West Brompton, S.W., Analytical Chemist.
- O.M. Robinson, Jno., 8, Kaludah Terrace, Albert Road, Widnes, Chemical Engineer.
- O.M. Robinson, Jos., Farnworth, Widnes, Chemical Manufacturer.
1887. Robinson, Thomas, (Journals) 401, West Street, Glasgow; and (communications), The Villa, Nitshill, N.B., Chemical Works Manager.
1902. Robitschek, Carl, 200, Worth Street, New York City, U.S.A., Scientific Brewer.
1903. Robson, Tom, Caixa 149, Pernambuco, Brazil, Engineer.
1894. Rodda, Edw. D., 6, Gold Street, Roath, Cardiff, Engineer.
1884. Rodger, Edw., 1, Clairmont Gardens, Glasgow, W.
1904. Rodger, Robert, Government Laboratory, Clement's Inn Passage, Strand, London, W.C., Chemist.
1904. Roeber, Dr. E. F., 114, Liberty Street, New York City, U.S.A., Editor, "Electrochemical Industry."
1903. Roelofsen, Dr. J. A., c/o Coal Distillation Co., Middlesbrough, Yorks., Works Manager.
1905. Rogers, Dr. Allen, 346, Madison Avenue, Flushing, N.Y., U.S.A., Research Chemist.
1900. Rogers, Geo. J., Wallaroo Smelting Works, South Australia, Chemist.
1890. Rogers, Harry, 5, Stoke Newington Common, London, N.
1899. Rogers, John, Ardeer Factory, Stevenston, Ayrshire, N.B., Chemist.
1901. Rogerson, John W., 101, Leadenhall Street, London, E.C., Maltster.
1898. Roller, H. C., 102, Montague Street, Brooklyn, N.Y., U.S.A., Superintendent.
1899. Rollin, Chas., Bylton, East Jarrow-on-Tyne, Chemical Manufacturer.
- O.M. Rollin, J. C., 1, St. Nicholas Buildings, Newcastle-on-Tyne, Chemical Manufacturer.

1898. Roode, Rudolf de, International Paper Co., Glens Falls, N.Y., U.S.A., Chemist and Superintendent.
- O.M. Roscoe, Sir Henry, F.R.S., 10, Bramham Gardens, South Kensington, S.W., Consulting Chemist.
1901. Roseow, Jas., 471, Park Avenue, Paterson, N.J., U.S.A., Colourist and Chemist.
1893. Roseow, Jno. F., P.O. Box 417, Boonton, N.J., U.S.A., Print Works Chemist.
1899. Roscow, Wm., 24, Prince Street, Pawtucket, R.I., U.S.A., Analytical Chemist.
1904. Rose, Jno., Wicken House, Stretton, near Warrington, Technical Chemist.
1901. Rose, Jno. Leonard, Gorton Brook Chemical Works, Manchester, S.E., Chemist.
1902. Rosebrugh, Prof. T. R., 666, Spadina Avenue, Toronto, Canada, Professor of Electrical Engineering.
1904. Rosenblatt, A. H., 55 East 92nd Street, New York City, U.S.A., Superintendent and Chemist, Toch Bros.
1897. Rosengarten, Dr. Geo. D., 1700, Fitzwater Street, Station D, Philadelphia, Pa., U.S.A., Manufacturing Chemist.
1896. Rosenheim, Dr. Otto, 68, Belsize Park Gardens, Hampstead, N.W., Research Chemist.
1887. Ross, Alex. J. J., Tayavalla, Falkirk, N.B., Chemical Manufacturer.
1893. Ross, Arthur, 1, Glengall Road, Old Kent Road, London, S.E., Analytical Chemist.
1901. Ross, Herbert W., Corner of Bancroft Way and Piedmont Avenue, Berkeley, Cal., U.S.A., Chemist.
1887. Ross, Jas. G., (Journals) 5-9, Sunbury Place, Belford Road; and (subscriptions) 47, Comely Bank Place, Edinburgh, Analytical Chemist.
1900. Ross, Raymond, Public Analyst's Office, Burnley, Lancashire, Analytical Chemist.
1904. Rostosky, Dr. Leopold, Tiergartenstrasse 28, Dresden Alt, Saxony, Chemist.
1888. Rothwell, C. F. Seymour, Photographic Works, Moberley, Cheshire, Chemist.
- O.M. Rottenburg, Paul, Castle Chambers, 55, West Regent Street, Glasgow, Chemical Merchant.
1896. Round, Wm., Albion Street, Birmingham, Analytical Chemist.
1899. Rouse, H. W., 62, Russell Road, Custom House, E., Foreman (Sulphuric Acid Works).
1903. Rouse, Wm., King Edward Street, Alexandria, Dumbartonshire, Chemist.
- O.M. Rowland, W. L., 4800, Chester Avenue, Philadelphia, Pa., U.S.A., Chemist.
1904. Rowley, Ernest W., Chemical Laboratory, Locomotive Department, North Eastern Railway, Gateshead-on-Tyne, Analytical Chemist.
1901. Rowley, Walter Eugene, c/o Schoellkopf, Hartford and Hanna Co., 100, William Street, New York City, U.S.A.
1904. Rowling, S. R., 1, Beechwood, Kendal, Westmoreland, Analyst.
1899. Roy, Benjamin, Ailsa Lodge, 17, Whitelaw Road, Chorlton-cum-Hardy, Manchester, Chemist.
1896. Royal-Dawson, H., 6, Wimbourne Road, City Road, Edgbaston, Birmingham, Chemist.
1898. Royle, Chas. L., c/o Parry and Co., Madras, India, Sugar Chemist.
1898. Royle, Thos. H., Bareilly, United Provinces, India, Chemist.
- O.M. Royle, T., 329, Upton Lane, Forest Gate, Essex, Chemical Engineer.
- O.M. Royse, S. W., St. Andrew's Chambers, 20, Albert Square, Manchester, Chemical Engineer.
1902. Rücker, Dr. Hermann von, Chemist.
1896. Ruddock, Fred. G., Egypt Street Chambers, Warrington, Analytical Chemist.
1895. Rudge, Alfred, Sutton Alkali Works, St. Helens, Lanes., Analytical Chemist.
1904. Ruef, Harry H., 335, Marshall Street, Elizabeth, N.J., U.S.A., Chemist.
1884. Ruffle, Jno., Musley, Ware, Herts., Consulting Chemist and Electrician.
1898. Ruhl, Louis, c/o Roessler and Hasslacher Chemical Co., P.O. Box 1999, 100, William Street, New York City, U.S.A., Chemical Merchant.
1902. Ruhoff, O. E., c/o Mineral Point Zinc Co., Mineral Point, Wis., U.S.A., Chemist.
- O.M. Rumble, C., Belmont Works, Battersea, London, S.W., Candle Works Chemist.
1899. Rumbold, Wm. R., 47, Watling Street, London, E.C., Electro-Metallurgist.
1895. Rump, Ernst, The Leeds Phosphate Works, Hunslet, Leeds, Manager.
1903. Runting, D. A., Moreland Grove, Coburg, Melbourne, Vic., Australia, Assayer.
1903. Runyan, Elmer G., Hutchins Building, Washington, D.C., U.S.A., Chemist and Gas Inspector.
1899. Rushby, Wm., 22, Surrey Street, Batley, Yorks., Analyst.
1901. Rushton, Benjamin, Waterloo, Whalley Road, Accrington, Analytical Chemist.
1887. Russell, D., Cadham, Markinch, Fife, N.B., Paper Maker.
1884. Russell, Jno., Anchor Brewery, Britten Street, Chelsea, London, S.W., Brewer.
1903. Russell, T. A., Walmer Road; and (Journals) 3, Queen's Park, Toronto, Ont., Canada, Manufacturer (Bicycles and Automobiles).
- O.M. Russell, Dr. W. J., F.R.S., 34, Upper Hamilton Terrace, London, N.W., Professor of Chemistry.
1901. Rust, Robt. R., c/o Mineral Point Zinc Co., North Chicago, Ill., U.S.A., Chemist.
1905. Ryan, Prof. F. G., (Journals) c/o Parke, Davis and Co., Detroit, Mich., U.S.A., and (subscriptions) c/o Parke, Davis and Co., 111, Queen Victoria Street, London, E.C., Manufacturing Chemist.
1884. Ryland, Howard P., Agricultural Chemist.

S

1895. Saalfeld, Adolphe, 2, South King Street, Manchester, Chemical Merchant.
1895. Saarbach, Dr. L., 114, Pearl Street, New York City, U.S.A., Consulting Chemist.
1905. Sabin, Alvah H., P.O. Box 85, Long Island City, N.Y., U.S.A., Chemist, Varnish Works.
1883. Sadler, A. E., Sand Hall, Ulverston, Lancashire, Manufacturing Chemist.
- O.M. Sadler, Dr. S. A., M.P., Middlesbrough-on-Tees, Colour Manufacturer.
1884. Sadtler, Dr. S. P., 145, North 10th Street, Philadelphia, Pa., U.S.A., Consulting Chemist.
1896. Sadtler, Dr. S. S., N.E. corner of 10th and Chestnut Streets, Germantown, Philadelphia, Pa., U.S.A., Chemist (U.S. Customs).
1905. Safford, E. Brigham, Albuquerque, New Mexico, U.S.A., Chemist.
1897. Sage, C. Edward, 2, Charterhouse Street, London, E.C., Consulting Chemist.
1902. Sahn, Louis N., 22, Cliff Street, New York City, U.S.A., Chemist.
1904. St. Clair-Fewings, Lt. 3, Bolingbroke Grove, Wandsworth Common, S.W., Incandescent Mantle Chemist.
1884. Salamon, A. Gordon, 1, Fenechurch Avenue, London, E.C., Consulting Chemist.
1885. Salamon, Jno., Rainham, S.O., Essex, Manufacturing Chemist.
1884. Salis-Mayenfeld, Dr. E. von., 9, Macpherson Terrace, Albany, N.Y., U.S.A., Technical Chemist.
1902. Salter, M. J., 65, Park Road, Crouch End, London, N., Analytical Chemist.
- O.M. Samuel, W. Colden, 66, Croxted Road, West Dulwich, S.E., Analytical Chemist.
- O.M. Samuelson, Rt. Hon. Sir Bernhard, Bart., F.R.S., 56, Prince's Gate, London, S.W., Ironmaster.
1896. Samuelson, Francis A. E., Sir B. Samuelson and Co., Ltd., Middlesbrough, Ironmaster.
1895. Samuelson, Godfrey B., Parliament Mansions, Victoria Street, London, S.W., Electrical Manufacturer.

1904. Sand, Dr. Henry J. S., University College, Nottingham, Lecturer and Demonstrator.
1902. Sanders, Warren W., c/o Larkin Soap Co., Buffalo, N.Y., U.S.A., Chemist.
1895. Sanderson, John, c/o B. S. Cohen, Ltd., 15, Clerkenwell Close, London, E.C., Chemist.
1898. Sanderson, T. C., Duboise Avenue, West New Brighton, N.Y., U.S.A., Chemical Engineer.
1884. Sandoz, R., 42, Lewisham Road, Dartmouth Park, N.W., Examiner at Patent Office.
- O.M. Sanford, P. Gerald, 20, Cullum Street, London, E.C., Public Analyst and Consulting Chemist.
1904. Sanger, Charles Robt., Harvard College, Cambridge, Mass., U.S.A., Professor of Chemistry.
1890. Saniter, E. H., Stratford Villa, Moorgate, Rotherham, Analytical Chemist.
1901. Sargent, Dr. Geo. W., Carpenter Steel Co., Reading, Pa., U.S.A., Chemist and Metallurgist.
1903. Saunders, Lewis E., Niagara Research Laboratories, Niagara Falls, N.Y., U.S.A., Electro-Chemical Engineer.
1896. Saunders, Walter M., 20, Dewey Street, Olneyville, R.I., U.S.A., Analytical Chemist.
1895. Savage, Arthur E., Charles Street, Elsternwick, Victoria, Australia, Metallurgist.
1895. Sawers, Wm. D., 1, Athole Gardens Place, Glasgow, Chemist.
1903. Sawin, Luther R., Office of Sanitary Patrol, Katonah, N.Y., U.S.A., Bacteriologist.
1903. Saxby, Fred. W., c/o P. Haulgrave and Co., 25, Hill Street, Liverpool, Tar Distiller.
1898. Saxe, Sigmund, 107, Manhattan Avenue, New York City, U.S.A., Manufacturing Chemist.
1895. Sayer, Harry, Cotwells, Ponders End, Middlesex, Metallurgical Chemist.
1894. Sayers, Jos. J., Nobel Villa, Stevenston, Ayrshire, Explosives Chemist.
1895. Scales, F. Shillington, "Jersey," St. Barnabas Road, Cambridge.
1899. Schaak, Dr. Milton F., 108, Penn Street, Brooklyn, N.Y., U.S.A., Chemist.
- O.M. Schaack-Sommer, Dr. G., 48, Marlborough Mansions, Victoria Street, London, S.W., Sugar Refiner.
1899. Schaefer, Dr. L., Maywood, N.J., U.S.A., Manufacturing Chemist.
1898. Schaffer, Herbert A., 321, Spring Garden Street, Easton, Pa., U.S.A., Chemist (Portland Cement).
1903. Schanehe, Herman G., 3401, Gray's Ferry Road, Philadelphia, Pa., U.S.A., Chemist.
1903. Scheidel, Dr. Aug., Union Club, Sydney, N.S.W., Australia, Managing Director.
1886. Schellhaas, Henry Alf., Thornhill, Beach Road, Hartford, Northwich, Mechanical Engineer.
1904. Schenck, Henry, 80, Washington Square, New York City, U.S.A.
1894. Schidrowitz, Dr. P., 57, Chancery Lane, London, W.C., Research Chemist.
1895. Schieffelin, Dr. W. Jay, 841, Southern Boulevard, New York City, U.S.A., Manufacturing Chemist.
1901. Schieren, G. Arthur, Dixie Tannery, Bristol, Tenn., U.S.A., Mechanical Engineer and Tanner.
1902. Schjölberg, T. E., Talta, Chile, S. America, Chemist.
1902. Schlegel, Jno. Wm., 602, East 5th Street, New York City, U.S.A., Chemist.
1893. Schleicher, Francis J., 38, West Tenth Street, Long Island City, N.Y., U.S.A., Technical Chemist.
1902. Schlesinger, Basil E., 92, Mount Vernon Street, Boston, Mass., U.S.A., Chemist.
1901. Schlichting, Emil, 38, Cranberry Street, Brooklyn, N.Y., U.S.A., Chemist.
1905. Schmidt, Herman B., 2523, Essex Place, W.W.H., Cincinnati, Ohio, U.S.A., Manufacturing Chemist.
1901. Schneider, Edw. J., c/o Union Carbide Co., Sault Ste. Marie, Mich., U.S.A., Chemist.
1899. Schniewind, Dr. F., c/o United Coke and Gas Co., 17, Battery Place, New York City, U.S.A., Chemist.
1904. Schniewind, Heinrich, Jun., Susquehanna Silk Mills, 62, Greene Street, New York City, U.S.A., Vice-President and Treasurer.
1897. Schoder, Dr. Robt., c/o Deutsche Gasgluheit Act.-Ges., 13, Alte Jakobstrasse, Berlin, Chemist.
1904. Schoeller, Walter R., 169-170, Shorelitch High Street, London, E.C., Analytical Chemist.
1902. Schofield, Jas. A., The University, Sydney, N.S.W., Australia, Lecturer in Chemistry.
- O.M. Schofield, H. E., Edge Hill Chemical Works, Liverpool, Chemical Manufacturer.
1898. Scholes, Geo. R., Liebig's Extract of Meat Co., Ltd., 21, Longue Rue des Chânes, Antwerp, Belgium, Analytical Chemist.
1902. Schoonmaker, H., c/o R. A. Perez, 120, North Main Street, Los Angeles, Cal., U.S.A., Metallurgical Chemist.
1895. Schroeder, E. August, c/o Church and Co., 36, Ash Street, Brooklyn, N.Y., U.S.A., Chemist.
1904. Schultz, Carl R., 440, First Avenue, New York City, U.S.A., Mineral Water Manufacturer.
1901. Schulze, Wm., 194, Academy Street, Jersey City Heights, N.J., U.S.A., Chemist.
1902. Schulze, Emil A., 15, Stanthorpe Road, Streatham, S.W., Incandescent Mantle Manufacturer.
1893. Schüpphaus, Dr. R. C., 174, Broadway, New York City, U.S.A., Consulting Chemist.
1893. Schwab, Dr. L. C., Sedanstrasse 53, Bernburg, Anhalt, Germany, Technical Chemist.
1901. Schwartz, David, c/o Southern Cotton Oil Co., Gresham, La., U.S.A., Chemist.
1902. Schwarz, Gustav A., Grasselli Chemical Co., 63, Wall Street, New York City, U.S.A., Manager.
1900. Schwarz, Dr. Henry P., c/o Western Sugar Refining Co., Potrero, San Francisco, Cal., U.S.A., Chemist.
1889. Schweich, Emile, *See* Mond, Emile S.
1903. Schweickert, Karl, 45, Hazelwood Avenue, Rahway, N.J., U.S.A., Chemist.
1894. Schweitzer, Dr. H., 40, Stone Street, New York City, U.S.A., Analytical Chemist.
1904. Schwitter, Martin, Tin City, Cape Prince of Wales, Alaska, U.S.A., Chemist and Assayer.
1891. Scott, Andrew, Royal Gunpowder Factory, Waltham Abbey, Essex, Analytical Chemist.
1889. Scott, Ernest G., 2, Talbot Court, Gracechurch Street, London, E.C., Soap Works Chemist.
1898. Scott, Jas., Cawnpore Woollen Mills, Cawnpore, India, Chemist.
1894. Scott, Jno. Gillespie, 33, Siennes Road, Edinburgh, Analytical Chemist.
1902. Scott, Walter, 696, Stockport Road, Longsight, Manchester, Chemist.
1894. Scott-Smith, G. E., 67, Surrey Street, Sheffield, Analytical Chemist.
1889. Scovell, M. A., Lexington, Kentucky, U.S.A., Agricultural Chemist.
1904. Scoville, Wilbur L., 50, Washington Street, Boston, Mass., U.S.A., Analytical Chemist.
1896. Scrymgeour, Wm., Fraser's Gold Mine, Southern Cross, West Australia, Chemist.
- O.M. Seadder, F., Mersey and Irwell Joint Committee, 44, Mosley Street, Manchester, Chemist.
1895. Seabrooke, H. Cecil, Black Ash, Grays, Essex, Research Chemist.
1900. Searby, Fred. M., West Berkeley, Cal., U.S.A., Oilworks Superintendent.
1889. Searl, Albert, Montreux, Victoria Road, Sidcup, Kent, Technical Chemist.
1898. Searle, Alf. B., 280, Western Bank, Sheffield, Analytical Chemist.
1896. Sedding, G. H. P., c/o Florida Syndicate, Jacksonville, Florida, U.S.A., Chemist.
1901. Sederholm, Erik, 28, Jakopsgatan, Stockholm, Sweden, Chemist (Royal Navy Board).
1901. Seeler, Dr. F., c/o Merck and Co., Rahway, N.J., U.S.A., Manufacturing Chemist.
1893. Sefton-Jones, Herbert, c/o W. P. Thompson and Co., 322, High Holborn, London, W.C., Chemist.
1902. Segal, Edw., Colonial Sugar Refining Co., Ltd., O'Connell Street, Sydney, N.S.W., Australia, Analytical Chemist.
1899. Seher, A., c/o Maas and Waldstein Co., Riverside Avenue, Newark, N.J., U.S.A., Chemist.

1896. Seldner, Rudolph L., 1395, Dean Street, Brooklyn N.Y., U.S.A., Instructor in Chemistry.
1904. Seligman, Dr. Richard, Messrs. J. and W. Seligman, Mills Buildings, New York City, U.S.A.; and (Journals) 17, Kensington Palace Gardens, London, W., Chemist.
1884. Semet, Louis, 217, Chaussée de Vleurgat, Brussels, Alkali Manufacturer.
1898. Sen (Gupta), Nagendra Nath, 19, Lower Chitpur Road, Calcutta, India, Physician and Chemist.
1895. Senger, Robt., 37, Warren Street, New York City, U.S.A., Manufacturing Chemist.
1899. Senior, Francis L., Lock 28, Sanford, Maine, U.S.A., Mill Chemist.
1904. Setzler, Dr. Horace B., c/o Lake Carriers Oil Co., Coraopolis, Pa., U.S.A., Superintendent.
- O.M. Sevin, C., 68, Central Hill, Upper Norwood, S.E.; and (Journals) c/o Dollman and Pritchard, 9 and 10, King Street, Cheapside, London, E.C., Chemical Engineer and Oil Refiner.
1900. Seward, Geo. O., Holcomb Rock, Va., U.S.A., Chemist.
1896. Seyler, Clarence A., Technical Institute, Nelson Terrace, Swansea, Chemist and Assayer.
1889. Seymour-Jones, A., Pendower, Wrexham, Leather Manufacturer.
1903. Shacklady, T. G., Addiscombe Villas, Cliffe-at-Hoo, Rochester, Technical Chemist.
1892. Shanks, Arch., Bridgend Mills, Dalry, Ayrshire, N.B., Chemist.
1883. Sharp, James, Shirley Manor, Wyke, near Bradford, Yorks., Dyer.
1891. Sharpe, Granville H., 11 and 12, Great Tower Street, London, E.C., Analytical Chemist.
1904. Sharples, G. H., Holly Villas, Sutton Lane, Middlewich, Cheshire, Works Chemist.
1884. Sharples, Stephen P., 26, Broad Street, Boston, Mass., U.S.A., Analytical Chemist.
1896. Sharpley, Wm. P., P.O. Box 102, Germiston, Transvaal, S. Africa, Analytical Chemist.
1900. Sharwood, Wm. J., 2600, Hillegas Avenue, Berkeley, Cal., U.S.A., Metallurgical Chemist.
1900. Shattuck, A. F., c/o Solvay Process Co., Detroit, Mich., U.S.A., Chemist.
- O.M. Shearer, A., 43, Derby Road, Burton-on-Trent, Technical Chemist.
1904. Shedden, Frank, 5, Belvidere Road, Walsall, Science Master.
1903. Sheldon, Dr. N. L., Cordite Factory, Aruvankad, Nilgiri Hills, India, Works Manager.
1903. Shenk, F. D., Box 553, Detroit, Mich., U.S.A., Chemist.
- O.M. Shenston, W. A., F.R.S., Tuffleigh, St. Vincent Rocks, Clifton, Bristol, Chemical Lecturer.
1892. Shenton, Jas. P., 37, Torbay Road, Chorlton-cum-Hardy, near Manchester, Analytical Chemist.
1902. Shepard, Chas. H., Laboratory, Union Iron Works, San Francisco, Cal., U.S.A., Chemist.
1889. Shepard, Dr. Chas. U. (communications) P.O. Box 42, Summerville, S.C.; and (Journals) 56, Broad Street, Charleston, S.C., U.S.A.
1904. Shepherd, A. B., c/o British Oil and Cake Mills, Ltd., 151, Cleveland Street, Hull.
1900. Shepherd, E. Sanger, 5-7, Gray's Inn Passage, Holborn, London, W.C., Scientific Instrument Maker.
1893. Shepherd, H. H. B., Northcote, Mount Pleasant Lane, Upper Clapton, N.E., Chemist.
1898. Shepherd, Reginald des F., c/o Calico Printers' Association, 56, Mosley Street, Manchester, Printworks Chemist.
1895. Sherman, G. W., Akron, Ohio, U.S.A., General Manager.
1899. Shero, John E., c/o Pittsburg Reduction Co., Niagara Falls, N.Y., U.S.A., Chemist.
1893. Shields, Dr. John, Minas de Rio Tinto, Prov. de Huelva, Spain, Chemist.
1896. Shimomura, K., c/o Osaka Seimi Works Co., Kawagishicho, Nishiku, Osaka, Japan, Chemist.
1886. Shimosé, Masachika, Shimosé Powder Works, Taki-nogawa, near Oji, Tokyo, Japan, Chemical Engineer.
1902. Shimotome, Henry, Higher Technical School, Asakusa, Tokyo, Japan, Professor of Chemistry.
1888. Shishkoff, Sergius A., Perm, Russia, Glass Manufacturer.
1899. Sholes, Chas. E., 25, Broad Street, New York City, U.S.A., Chemical Agent.
1900. Shonk, Albert, 6, York Road, West Hendon, Analytical Chemist.
1899. Shores, Dr. Jeff. H., 39, Derby Road, Widnes, Chemist.
1897. Shorey, Dr. Edmund C., P.O. Box 360, Honolulu, H.I., Chemist.
1904. Short, Andrew, Choppington, Morpeth, Works Chemist.
1903. Shorter, A. E., 64, Garden Reach, Calcutta, India, Soap and Candle Manufacturer.
1902. Shoubridge, Sydney Y., M.I.C.E., Gasworks, Lower Sydenham, S.E., Gas Engineer.
1901. Shukoff, Dr. Alexis A., Borowaja No. 86, St. Petersburg, Russia, Technical Chemist.
1899. Shuler, Darius P., Mine La Motte, Mo., U.S.A., Chemist.
1890. Shutt, Frank T., Central Experimental Farm, Ottawa, Canada, Agricultural Chemist.
1901. Siau, Raymond, L., Springfield Brewery, Wolverhampton, Carbohydrate Research Chemist.
1902. Silley, Samuel E., 3, Rutland Road, Ilford, Essex, Technical Chemist.
1902. Siebold, Alfred, Eglinton Dyewood Mills, Alloa, N.B., Technical Chemist.
1901. Silberrad, Dr. Oswald, 51, Shooter's Hill Road, Blackheath, S.E., Research Chemist.
1892. Silvester, Harry, 78, Holyhead Road, Handsworth, Birmingham, Analytical and Consulting Chemist.
1901. Sim, Wilfrid A., c/o Wm. Sim and Son, 40, Jane Street, Leith, N.B., Colour Manufacturer.
1903. Simmons, Wm. H., Oakleigh, Stoke Newington Common, N., Analytical Chemist.
1898. Simon, Dr. A., 55-56, Bishopsgate Street, London, E.C., Chemical Engineer.
1890. Simonds, Dr. F. M., 159, Front Street, New York City, U.S.A., Mining Engineer and Assayer.
1902. Simonson, Wm., 126, West 9th Street, Cincinnati, Ohio, U.S.A., Chemist.
1905. Simpson, Edward H., 52 Park Street, Jersey City, N.J., U.S.A., Chemist.
1897. Simpson, E. S., Geological Survey Laboratory, Museum Street, Perth, West Australia, Assayer.
1905. Simpson, Henry, 120, Denman Street, Radford, Nottingham, Works Chemical Assistant.
- O.M. Simpson, W. S., 17, Lakeside Road, Palmer's Green, N., Analytical Chemist.
1900. Sims, W. Edgar, Portinscale Lodge, Higher Crumpsall, Manchester, Technical Chemist.
1894. Sinclair, Dr. W., 60, Stirling Road, Trinity, Edinburgh, Chemist.
1890. Sindall, R. W., 201, Wellmeadow Road, Catford, S.E., Paper Mills Chemist.
1889. Singer, Ignatius, Housforth, near Leeds, Manufacturing Chemist.
1899. Singmaster, J. Arthur, c/o New Jersey Zinc Co. of Penna., Palmerton, Pa., U.S.A., Chemist.
1901. Sinnatt, Frank S., Glenside, Church Lane, Moston, Manchester, Demonstrator of Chemistry.
- O.M. Sisson, G., Jun., c/o Washington Chemical Co., Ltd., Washington Station, R.S.O., Co. Durham, Works Manager.
1885. Skaife, Wilfred T., 630, Sherbrooke Street, Montreal, Canada, Sugar Chemist.
1894. Skelton, John R., c/o Norwich Crape Co., Ltd., St. Augustine's, Norwich, Technical Chemist.
1897. Skertchley, W. P., Laboratory, 11, Billiter Square, London, E.C., Analytical Chemist.
1904. Skerten, Wm. B., 25, Broad Street, New York City, U.S.A., Chemical Accountant.
1891. Skilton, C. F. E., Brewery House, Staines, Brewer.
1901. Skinner, Hervey J., c/o Little and Walker, 93, Broad Street, Boston, Mass., U.S.A., Chemist.
1904. Skirrow, Dr. F. W., 3, Bignor Street, Cheetham, Manchester, Research Chemist.

1903. Skoglund, Jean V., 112, West 117th Street, New York City, U.S.A., Chemist.
1904. Skowinski, S., Republic Rubber Co., Youngstown, Ohio, U.S.A., Chemist.
1896. Skurray, Thos., United Breweries, Abingdon, Berks., Brewer.
1904. Slater, Dr. Arthur, University College, Nottingham, Lecturer and Demonstrator.
1887. Slatter, Geo. W., Carlton Terrace, Nab Wood, Shipley, Yorkshire, Analytical Chemist.
1895. Slocum, Dr. Frank L., 101, South Linden Avenue, E.E., Pittsburg, Pa., U.S.A., Chemist.
1899. Slosson, Edwin E., University of Wyoming, Laramie, Wyoming, U.S.A., Professor of Chemistry.
1883. Smail, J. I., Warren Wood, Hayes Common, Beckenham, Kent, Chemical Manufacturer.
1901. Smale, Dr. F. J., c/o Wm. Davies Co., Toronto, Canada, Chemist.
1898. Small, Fritz H., c/o Graton and Knight Manufacturing Co., Worcester, Mass., U.S.A., Chemist.
1904. Smallman, J. E., c/o Canada Chemical Manufacturing Co., Ltd., London, Ont., Canada, Chemist.
1904. Smart, Bertram J., 37, Burwash Road, Plumstead, S.E., Chemist.
- O.M. Smetham, A., 16, Brunswick Street, Liverpool, Analytical Chemist.
1884. Smiles, Jas., 173, Bruntsfield Place; and (Journals) Blandfield Chemical Works, Lower Broughton Road, Edinburgh, Manufacturing Chemist.
1904. Smith, Albert E., c/o Mount Hope Finishing Co., North Dighton, Mass., U.S.A., Superintendent.
1886. Smith, Alfred, Excelsior Chemical Works, Clayton, Manchester, Manufacturing Chemist.
1898. Smith, Alf. B., Ryecroft, Glossop, Derbyshire, Bleacher and Dyer's Manager.
1897. Smith, Allan, c/o Kellner-Partington Paper Pulp Co., Hallein, bei Salzburg, Austria, Chemist.
1898. Smith, Andrew B., P.O. Box, 90, Queenstown, C.C., S. Africa, Chemist.
1896. Smith, Andrew T., c/o Castner-Kellner Alkali Co., Ltd., 43, Castle Street, Liverpool, General Manager.
1905. Smith, Arthur, Townend Chemical Works, Bramley, Leeds, Chemical Manufacturer.
1905. Smith, Chas. E., Herold's Institute, Drummond Road, Bermondsey, S.E., Tanner.
1893. Smith, Edgar B., Prince Regent's Wharf, Silvertown, E., Chemist.
1895. Smith, Dr. E. Ellsworth, 26, East 29th Street, New York City, U.S.A., Consulting Physiological Chemist.
- O.M. Smith, Edgar F., c/o E. M. Robson, Trelawny, Fairfax Road, Bedford Park, W., Chemist.
1892. Smith, Ernest A., The Assay Office, Leopold Street, Sheffield, Assayer.
1900. Smith, E. Sell, 219, East Market Street, Warren, Ohio, U.S.A., Manufacturing Chemist.
1903. Smith, Ewing, c/o Borneo Co., Ltd., Kutehing, Sarawak, Borneo, Analytical Chemist.
1903. Smith, F. M., 100, William Street, New York City, U.S.A., President (Pacific Coast Borax Co.).
1891. Smith, Francis P., Room 510, 190-194 Bowery, New York City, U.S.A., Chemist.
1902. Smith, Frank Gurney, 7, Luxemburg Gardens, Brook Green, W., Chemical Student.
- O.M. Smith, G., Rosehall Terrace, Falkirk, N.B., Explosive Works Manager.
1879. Smith, Sir Geo. J., c/o Bickford, Smith, and Co., Ltd., Tuckermill, Cornwall, Fuse Manufacturer.
1890. Smith, Harry, 93, Holly Avenue, Newcastle-on-Tyne, Colour Works Manager.
1890. Smith, Harry E., L.S. and M.S. Railway, Collingwood, Ohio, U.S.A., Analytical Chemist.
1904. Smith, Henry, 83, Brownlow Road, Horwich, Bolton-le-Moors, Lanes., Analytical Chemist.
1905. Smith, Hugh Dunford, 8 and 10, The Side, Newcastle-on-Tyne, Analytical Chemist.
1900. Smith, H. Ewing, 37, Washington Street, Glasgow, Manufacturing Chemist.
1902. Smith, Hy. Geo., Technological Museum, Harris Street, Ultimo, Sydney, N.S.W., Australia, Assistant Curator and Chemist.
1901. Smith, H. Procter, Shotton Lane, Shotton, Flintshire, Metallurgical Chemist.
- O.M. Smith, H. R. I., Aubert Park, Highbury, London, N., Analytical Chemist.
1901. Smith, H. Sutcliffe, Edward Ripley and Son, Ltd., Bowling Dyeworks, Bradford, Managing Director.
1890. Smith, H. Wood, c/o John Pott and Co., Ltd., 39, Old Broad Street, London, E.C., Chemist.
1897. Smith, James, 30, Milner Road, Aigburth, Liverpool, Analytical Chemist.
1903. Smith, James, South Bank, Frodsham, Cheshire, Metallurgist.
1893. Smith, Jas. F., 15, Second Avenue, Halifax, Yorks, Analytical Chemist.
- O.M. Smith, J., Ash Grove House, Radcliffe, Manchester.
1901. Smith, J. Cruickshank, 5, The Elms, London Road, Wembley, Middlesex, Technical Chemist.
- O.M. Smith, Dr. J. H., Wollishofen, Zürich, Switzerland, Chemical Manufacturer.
1884. Smith, J. Johnstone, Lockwood Brewery, Huddersfield, Brewing Chemist.
1902. Smith, Jno., Colonial Sugar Refining Co., Ltd., O'Connell Street, Sydney, N.S.W., Australia.
1898. Smith, John, Calder Wharf Dyeworks, Ravenshorpe, Dewsbury, Dyer.
- O.M. Smith, Jno. W., 7, Brookfield Street, Roslindale, Boston, Mass., U.S.A., Analytical Chemist.
1888. Smith, J. Tertius, Richmond House, Plaistow, Essex, Technical Chemist.
1890. Smith, J. Wm., Solvay Process Co., Syracuse, N.Y., U.S.A., Alkali Works Manager.
1896. Smith, Joseph Kent, 32, Hough Green, Chester, Metallurgical Chemist.
1898. Smith, R. F. Wood, Laboratory, 89, Bartholomew Close, E.C., Consulting Chemist.
1890. Smith, Dr. R. Greig, Linman Society's House, Elizabeth Bay, Sydney, N.S.W., Bacteriologist and Chemist.
1890. Smith, R. Watson, P.O. Box 85, Knight's, Transvaal, S. Africa, Chemical Works Manager.
1900. Smith, T. Connell, Blandfield Chemical Works, Edinburgh, Manufacturing Chemist.
1897. Smith, Theophilus R., c/o Brotherton and Co., Ltd., Haigh Park Chemical Works, Stourton, near Leeds, Chemist.
1896. Smith, Walter E., 14, Cypress Street, Providence, R.I., U.S.A., Instructor in Chemistry.
1903. Smith, Dr. Warren R., Lewis Institute, Chicago, Ill., U.S.A., Teacher.
- O.M. Smith, Watson, 31, Upper Park Road, Haverstock Hill, N.W., Editor of Society's Journal.
- O.M. Smith, Wilfred, 182, West Street, Glasgow, Chemical Manufacturer.
1896. Smith, Dr. W. Stanley, Bryntirion, Bersham, near Wrexham, North Wales, Brewer.
- O.M. Smithells, Prof. A., F.R.S., The University, Leeds, Professor of Chemistry.
1902. Smither, F. W., 310½, Union Street, Nashville, Tenn., U.S.A., Analytical Chemist.
- O.M. Smithers, F. O., Dashwood House, 9, New Broad Street, London, E.C., Chemical Agent.
1902. Smoot, Albert M., 1263, Waverly Place, Elizabeth, N.J., U.S.A., Analytical Chemist.
1902. Smyth, Dr. Morland, c/o Mander Bros., John Street, Wolverhampton, Chemist.
1902. Smythe, Jno. A., Armstrong College, Newcastle-on-Tyne, Demonstrator in Chemistry.
1902. Smythe, Dr. J. S., Rantallard, Lance Lane, Waverly, Liverpool, Analytical Chemist.
1888. Snape, Dr. H. Lloyd, Balholm, Lathom Road, Southport, Director of Education for Lancashire.
1896. Snowden, J., Jun., Messrs. Snowden, Sons and Co., Millwall, E., Chemical and Oil Manufacturer.
1902. Snyder, Prof. Harry, 2000, Commonwealth Avenue, St. Anthony Park, Minn., U.S.A., Professor of Agricultural Chemistry.
1900. Sodeau, Wm. H., 114, Park Road, Newcastle-on-Tyne, Chemist.

1903. Sohlman, Ragnar, Bofors, Sweden, Manager (A. B. Bofors' Nobelkrut).
1894. Sohn, Chas. E., 2, Harpur Street, Bedford Row, London, W.C., Analyst.
1895. Solvay, Armand, 25, Rue Prince Albert, Brussels, Gérant de la Société Solvay et Cie.
1884. Solvay, Ernest, 43, Rue des Champs Elysées, Brussels, Alkali Manufacturer.
1903. Sommermeier, Edw. E., 1590, Neil Avenue, Columbus, Ohio, U.S.A., Chemist.
1897. Somerset, H. St. John, Jun., Mount Morgan Gold Mining Co., Mount Morgan, Queensland, Australia, Assayer.
1884. Sommer, Adolf, corner 1st and Binney Streets, East Cambridge, Boston, Mass., U.S.A., Pharmaceutical Chemist.
1894. Sonstadt, Edw., Church Fields, Cheshunt, Herts., Chemical Technologist.
1904. Southall, A. W., Lower Priory, Birmingham, Manufacturing Chemist.
1896. Souther, H., Hartford, Conn., U.S.A., Chemical and Metallurgical Engineer.
1904. Southerden, F., c/o Mrs. Beer, Summerlands, Topsham Road, Exeter.
1892. Southern, Thos., Jun., Wheathill Chemical Works, St. Simon Street, Salford, Manufacturing Chemist.
1883. Soward, A. W., 28, Therapia Road, Honor Oak, S.E., Principal Clerk (Legacy Duty Office).
1890. Sowerby, Thos., H., Canal Soap Works, Verney Road, London, S.E., Soap Manufacturer.
- O.M. Sowerby, W. M., c/o United Alkali Co., Ltd., All-husen Works, Gateshead-on-Tyne, Manager.
1887. Spackman, Chas., Roselaugh, Clitheroe, Lancashire, Portland Cement Manufacturer.
1904. Sparke, Archibald, Public Library and Art Gallery, Bury, Lancs., Chief Librarian, &c.
1904. Sparre, Fin, Experimental Department of E.I. du Pont Co., Wilmington, Del., U.S.A., Chemist.
1901. Sparrow, J. Marcellus, c/o Imperial Varnish and Colour Co., Ltd., 6-22, Morse Street, Toronto, Canada, Varnish and Colour Manufacturer.
1904. Spayd, Chas. Hay, 5143, Arch Street, Philadelphia, Pa., U.S.A., Analytical Chemist.
1904. Speiden, C. C., Summit, N.J., U.S.A., Chemical Merchant.
1883. Spence, D., Sendig Hotel, Europaeischer Hof, Dresden A. Germany, Alum Manufacturer.
- O.M. Spence, F., Alum Works, Manchester, Alum Manufacturer.
1900. Spence, Howard, (Journals) Audley, Broad Road, Sale, Cheshire; and Alum Works, Manchester, Chemical Manufacturer.
1901. Spence, Jno. Davidson (Journals) 2, Hawkhill Place, Dundee; and (communications) 39, Mincing Lane, London, E.C., Consulting Chemist.
1883. Spence, Jno. W., Tiviot Colour Works, Manchester Road, Stockport, Drysalter.
1903. Spencer, Arthur G., 146, St. James' Street, Montreal, Canada, Chemist.
1884. Spencer, Jno., Globe Tube Works, Wednesbury, Tube Manufacturer.
- O.M. Spencer, J. W., Newbiggin House, Kenton, Newcastle-on-Tyne, Steel Manufacturer.
1901. Spencer, Robt., Jun., c/o E. Ripley and Son, Ltd., Bowling Dyeworks, Bradford.
1902. Sperry, Elmer A., 855, Case Avenue, Cleveland, Ohio, U.S.A., Electrical Engineer.
1897. Sperry, Erwin S., P.O. Box 656, Bridgeport, Conn., U.S.A., Metallurgist.
1884. Spiegel, Dr. Adolf, Messel, bei Darmstadt, Germany, Analytical Chemist.
1899. Spieler, Aug. J., 543, Gifford Street, Syracuse, N.Y., U.S.A., Stearic Acid Works Superintendent.
1903. Spielmann, P. E., 21, Cadogan Gardens, London, S.W., Chemical Student.
1889. Spies, Adolph, 102, Fenchurch Street, London, E.C., Chemical Merchant.
1889. Spies, Hermann, 102, Fenchurch Street, London, E.C., Chemical Merchant.
1885. Spiller, A., Edison-Swan Electric Co., South Benwell Works, Newcastle-on-Tyne, Electrician.
- O.M. Spiller, J., 2, St. Mary's Road, Canonbury, London, N., Consulting Chemist.
1896. Spoor, J. L., Madras Cement Works, Madras, India; and (Journals), Rede Court, Rochester, Kent, Portland Cement Manufacturer.
- O.M. Sprengel, Hermann Johann Philipp, Ph. D. (Heidelb.), F.R.S., Royal Prussian Professor (titular); Journals to Prof. Sprengel, F.R.S., Savile Club, 107, Piccadilly, London, W., Chemist.
1900. Spurge, Edw. C., 619, Buffalo Avenue, Niagara Falls, N.Y., U.S.A., Chemist.
1901. Spurlin, Oscar L., c/o Georgia Cotton Oil Co., 919, Austell Building, Atlanta, Ga., U.S.A., Chemist.
- O.M. Squire, P. W., 413, Oxford Street, London, W., Pharmaceutical Chemist.
- O.M. Squire, Dr. W. S., Clarendon House, St. John's Wood Park, London, N.W., Chemical Engineer.
1896. Stafford, Chas. H., Hollyfield, Weldbank; and (Journals) c/o The Birkacre Printing Co., Chorley, Lancs., Colourist.
- O.M. Stahl, Dr. K. F., 57th Street and A. V. Ry., Pittsburgh, Pa., U.S.A., Chemical Works Manager.
1905. Stahl, Paul G., 10, Rue des Canonniers, Lille (Nord), France, Chemical Manufacturer.
1903. Stainton, Dr. W. J., 3, Holmdale Road, West Hampstead, N.W., Colour Chemist.
1905. Stamp, Edward, Florence House, Dewsnap Lane, Dukinfield, Sewage Works Manager.
1904. Standfast, Jno. T., c/o Messrs. Burt, Boulton, and Haywood, Ltd., Szaete, Belgium, Chemist.
1888. Stantial, Frank G., c/o Coghrane Chemical Co., Everett, Mass., U.S.A., Technical Chemist.
1885. Staples, H. J., The Old Hall, Spondon, Derby, Colour Manufacturer.
- O.M. Stark, J. F., Rosedale, Bromborough, Cheshire, Works Superintendent.
1896. Statham, Noel, Compania General de Productos Quimicos del Aboño, Gijón, Spain, Engineer.
1904. Stauffacher, W., 64, Oberwilerstrasse, Basle, Switzerland, Chemical Works Manager.
1895. Stead, J. Christopher, I, Finsbury Circus, London, E.C., Technical Chemist.
- O.M. Stead, J. E., 11, Queen's Terrace, Middlesbrough-on-Tees, Analytical Chemist.
1898. Stearns, Theron C., 44, Montgomery Street, Jersey City, N.J., U.S.A., Consulting Chemist.
- O.M. Stebbins, Dr. J. H., 80, Madison Avenue, New York City, U.S.A., Analytical Chemist.
- O.M. Steedman, R. H., Whinfield, Prestwick, Ayrshire, N.B., Chemical Manufacturer.
1896. Steel, Fred, W., c/o Cuming, Smith and Co., Yarraville, Melbourne, Vic., Australia, Chemist.
1900. Steel, Jno. S., Adelaide Chemical Works, Thebarton, Adelaide, South Australia, Chemist.
1884. Steel, R. Elliott, 38, East Park Parade, Northampton, Headmaster.
- O.M. Steel, Thos., Colonial Sugar Refinery, O'Connell Street, Sydney, N.S.W., Australia, Sugar Chemist.
1897. Stein, Sigmund, 214, Upper Parliament Street, Liverpool, Sugar Refinery Manager.
1905. Steiner, Dr. Otto, The Penpoll Tin Smelting Co., Ltd., Bootle, Liverpool, Electrochemist.
1897. Steinhart, Dr. Oscar J., 4, Palace Street Mansions, Buckingham Gate, S.W., Manufacturing Chemist.
1901. Steinmetz, Chas. P., Research Laboratory, General Electric Co., Schenectady, N.Y., U.S.A., Electrician.
1903. Stell, S. F., 25, Henry Street, Keighley, Yorks., Teacher of Chemistry.
1887. Stenhouse, T., Townhead, Rochdale, Analytical Chemist.
1903. Stephan, Geo. B., c/o Larkin Soap Co., Buffalo, N.Y., U.S.A., Perfumer.
1904. Stephen, A. E., Lachlan Gold Fields, Ltd., Forbes, N.S.W., Australia, Analytical Chemist.
1884. Stephens, H. Chas., M.P., Avenue House, Finchley, N., Ink Manufacturer.
1892. Stephens, M. E., 4, Carlton Gardens, London, S.W.; and (Journals) 57-60, Aldersgate Street, London, E.C., Ink Manufacturer.

1889. Stern, Arthur L., Southbank, Stapenhill Road, Burton-on-Trent, Brewing Chemist.
- O.M. Steuart, D. R., Osborne Cottage, Brookburn, West Lothian, N.B., Oilworks Chemist.
1903. Steven, A. B., The University, Leeds, Lecturer on Dyeing.
1899. Stevenot, G. A., c/o H. A. Metz Co., 122, Hudson Street, New York City, U.S.A., Chemist.
1898. Stevens, Arthur F., 61, Balfour Road, Highbury New Park, N., Paper Examiner.
1904. Stevens, Edgar B., 688, 7th Street, Buffalo, N.Y., U.S.A., Treasurer and Chemist.
1902. Stevens, Dr. Hy. P., Laboratory, 15, Borough, London Bridge, S.E., Consulting Chemist.
1894. Stevens, Jno. H., 295, Ferry Street, Newark, N.J., U.S.A., Manufacturing Chemist.
1902. Stevens, M. White, H.M. Patent Office, Chancery Lane, London, W.C., Chemist.
1903. Stevens, T. R. B., 39, High Street, Battersea, S.W., Metallurgical Chemist.
1884. Stevens, Wm., The Native Guano Co., Ltd., 29, New Bridge Street, London, E.C., Secretary.
1899. Stevenson, Arnold, 1, Porchester Gardens, London, W., Chemist.
- O.M. Stevenson, Sir Thos., M.D., Guy's Hospital, London, S.E., Chemical Lecturer.
- O.M. Stevenson, W., Standard Works, 95A, Southwark Street, London, S.E., Chemical Manufacturer.
1901. Stewart, David B. D., Aberdeen Comb Works, Hutcheon Street, Aberdeen, Managing Director.
1903. Stewart, Jas., 3, Ludgate Circus Buildings, London, E.C., Editor ("Gas World").
1890. Stewart, Robt., 43, Leagrave Road, Luton, Chemical Works Manager.
1896. Stewart, R. Patrick, 59, Wellwood Terrace, Kerr Street, Kirkintilloch, N.B., Analytical Chemist.
- O.M. Stewart, S., c/o Michael Nairn and Co., Ltd., Kirkealdy, N.B., Technical Chemist.
1899. Stewart, Saml., 16, Great George Street, Westminster, S.W., and (Journals) Parkhurst Park Road, Wallington, Surrey, Managing Director (Explosives Co.).
1904. Stieglitz, Julius, University of Chicago, Chicago, Ill., U.S.A., Associate Professor of Chemistry.
1901. Stifel, Walter H., 1319, Locust Street, Allegheny, Pa., U.S.A., Tanner.
1904. Still, John T., London Portland Cement Works, Northfleet, Kent, Works Chemist.
1903. Stillwell, Albert G., 55, Fulton Street, New York City, U.S.A., Chemist.
1903. Stingelin, Dr. Fritz, c/o Solvay Process Co., Syracuse, N.Y., U.S.A., Chemist.
1886. Stirk, Jos., Ferncliffe, Elm Bank, Nottingham, Brewer's Engineer.
1893. Stock, F. W., Keating, County Analyst's Office, Darlington, Analytical and Consulting Chemist.
1900. Stockdale, Edgar, c/o E. Dewhurst and Co., Ltd., Printworks, Batley, Yorks., Colour Mixer.
1888. Stockdale, Wm., Irwell Printworks, Stacksteads, near Manchester, Calico Printer.
1887. Stocks, H. B., Lynwood, Neston, Cheshire, Analytical Chemist.
1903. Stoddard, Jesse D., Detroit Testing Laboratory, 1111 Union Trust Building, Detroit, Mich., U.S.A.
1885. Stoddart, F. Wallis, Western Counties Laboratory, College Green, Bristol, Analytical Chemist.
1899. Stoddart, Reginald T., Corporation Tar Works, Charlestown Road, Halifax, Yorks., Manager.
- O.M. Stoer, J., 6, Hanover Quay, Dublin.
1903. Stofer, Richard C., 28, Hayes Street, Norwich, N.Y., U.S.A., Pharmaceutical Chemist.
- O.M. Stoker, G. N., 9, Lessar Avenue, Clapham Common, S.W., Analytical Chemist.
1899. Stokes, Alf. W., Laboratory, Vestry Hall, Paddington Green, W., Public Analyst.
1898. Stokes, Dr. Henry N., Bureau of Standards, Washington, D.C., U.S.A., Chemist.
1904. Stokes, J. A., 354, Castleford Road, Normanton, Yorkshire, Research Scholar.
1892. Stone, Frank, Laboratory, 193, Collin Street, Melbourne, Victoria, Analytical Chemist and Assayer.
1900. Stone, Geo. C., c/o New Jersey Zinc Co., 71, Broadway, New York City, U.S.A., Engineer.
1899. Stone, L. F., 100, William Street, New York City, U.S.A., Chemical Merchant.
1888. Stone, Thos. W., Chemical Works, St. George, Bristol, Chemical Manufacturer.
- O.M. Storey, F. H., Haverbrooks, Lancaster, Chemical Manufacturer.
1903. Stormer, Edward J., J. J. Case Flow Works, Racine, Wis., U.S.A., Analytical Chemist.
1902. Storr, Bertram A., 61, Balfour Road, Hford, Essex, Chemist.
1888. Stowe, W. T., H. Camphill Avenue, Langside, Glasgow, Analytical Chemist.
1904. Strange, Edward, Halford, 7, Staple Inn, Holborn, London, Technical Research Chemist.
1905. Strange, Wm. Wallace, jun., Reduction Works, Anaconda Copper Mining Co., Anaconda, Montana, U.S.A., Chemist.
1883. Strangeman, J. Pm., Bleacher.
1903. Strayer, D. W., 112, Newman Avenue, Bayonne, N.J., U.S.A., Chemist.
1903. Strickler, Emerson H., c/o General Chemical Co., 25, Broad Street, New York City, U.S.A., Chemist.
1887. Strong, Colin R., 13, St. Ann Street, Manchester, Oil Merchant.
- O.M. Stuart, C. E., 29, Mosley Street, Newcastle-on-Tyne, Chemical Apparatus Dealer.
1896. Stuart, Harry T. R., Know Mill House, Entwistle, near Bolton, Printworks Sub-Manager.
- O.M. Stuart, T. W., 7, Livingston Drive, Sefton Park, Liverpool, Alkali Works Manager.
1901. Stuart, Dr. W. Theophilus, 197, Spadina Avenue, Toronto, Canada, Physician and Professor of Chemistry.
1896. Stubbs, Augustus J., 50, Calle de Ferraz, Madrid, Spain.
- O.M. Studer, Dr. A., Postgebäude, Olten, Switzerland, Consulting Chemist.
1890. Studer, Simon J., Helvetia, Stockton Heath, near Warrington, Technical Chemist.
1903. Sturrock, Capt. G. C., R.A., Aruvankad, Nilgiris, India, Assistant Superintendent.
1896. Styles, R., Curling, Knockhall, Greenhithe, Kent, Analytical Chemist.
1896. Suckert, Dr. J. J., 141, Broadway, New York City, U.S.A., Manufacturing Chemist.
1895. Sudborough, Dr. J. J., University College of Wales, Aberystwith, Lecturer in Chemistry.
1889. Sulman, H. L., 44, London Wall, London, E.C., Chemist and Metallurgist.
1895. Summers, Bertrand S., 2368, Military Street, Port Huron, Mich., U.S.A., Electro-Chemist.
1890. Sumner, Harold, Worthington, near Wigan, Dyer and Bleacher.
1896. Sunderland, A., 84, Hainworth Wood Road, Ingrow, Keighley, Teacher of Chemistry.
1899. Sundström, Carl, c/o Solvay Press Co., Detroit, Mich., U.S.A., Chemist.
1895. Sundström, Karl J., Sibley, Mich., U.S.A., Manufacturing Chemist.
1884. Sutherland, D. A., 13, Victoria Street, Westminster, S.W., Consulting Technical Chemist and Assayer.
1894. Sutherland, Geo., Croft Cottage, Bonhill, N.B., Chemist.
1887. Sutherland, Jas., c/o British Aluminium Co., Ltd., Larne Harbour, Co. Antrim, Ireland, Chemist.
- O.M. Sutherland, R. M., Lime Wharf Chemical Works, Falkirk; and Solsgirth, Dollar, N.B., Chemical Manufacturer.
1901. Sutro, H. H., 126, Liberty Street, New York City, U.S.A., Chemist.
- O.M. Sutton, Francis, Norfolk County Laboratory, Redwell Street, Norwich, Analytical Chemist.
1886. Sutton, F. Napier, 6, Grosvenor Gardens, Willesden Green, N.W., Alkali Works Inspector.

1900. Sutton, W. Lincolne, Hillcroft, Eaton, Norwich, Public Analyst.
- O.M. Swan, J. Cameron, 4, Nicholas Buildings, Newcastle-on-Tyne, Manufacturing Chemist.
- O.M. Swan, Sir Jos. W., F.R.S., 58, Holland Park, London, W., Chemist and Electrician.
1898. Swanson, Jas. F., 5, Edmiston Terrace, Copeland Road, Govan, N.B., Technical Chemist.
1884. Swinburne, Geo. (Journals), 99, Queen Street, Melbourne, Australia; (subs.) c/o Jno. Coates and Co., Suffolk House, Laurence Pountney Hill, E.C., Gas Engineer.
1904. Swindells, Seth, The Laurels, Scholar Green, Stoke-on-Trent, Chemist.
1901. Swinton, Ralph S., c/o W. J. Bush, Incorporated, Linden, N.J., U.S.A., Analytical Chemist.
1903. Sykes, Walter F., 85, Water Street, New York City, U.S.A., Chemical Merchant.
1902. Sylow, Paul L. P., G. Korsör, Alexandra Street, Drummoyn, Sydney, N.S.W., Australia, Analytical Chemist.
- O.M. Syme, W. B., Elm Cottage, Addiewell, West Calder, N.B., Oil Works Chemist.
1903. Symmes, Whitman, 630, Harrison Street, San Francisco, Cal., U.S.A., Chemical Engineer.
- T
1895. Taber, G. H., 814, Frick Building, Pittsburg, Pa., U.S.A., General Manager (Gulf Refining Co.).
1896. Takagi, T., Kyoikuhin, Seizo Kaisha, Asakusa, Shieikhen Cho, Tokyo, Japan, Chemical Engineer.
- O.M. Takamatsu, T., Tokyo University, Japan, Analytical Chemist.
- O.M. Takamine, Dr. J., 613, West 142nd Street, New York City, U.S.A., Engineer.
1890. Takayama, Jintaro, Nando Machi 26, Ushigome, Tokyo, Japan, Director (Imperial Industrial Experiment Station).
1901. Talati, K. E., Tirvettyoor, near Madras (Chingulput), India, Leather Dresser.
1903. Talbott, Dr. B. E., Chaneyville, Md., U.S.A., Manufacturing Chemist.
1902. Talley, Thos. Washington, Fisk University, Nashville, Tenn., U.S.A., Chemist.
1898. Tanaka, Keishin, Matsuba Hotel, Kudansaka, Ōye, Tokyo, Japan, Chemist.
1900. Tankard, Arnold R., 67, Surrey Street, Sheffield, Analytical Chemist.
- O.M. Tate, F. H., 9, Hackins Hey, Liverpool, Analytical and Technical Chemist.
1902. Tate, Francis G. H., Kilmersdon, Homecroft Road, Sydenham, S.E., Analyst (H.M. Customs).
- O.M. Tatlock, J., 45, Renfrew Street, Glasgow, Laboratory Furnisher.
- O.M. Tatlock, R. R., Novara, Stirling, N.B., Consulting Chemist.
1902. Tatters, Hugh Lee, 17, Waterloo Road, Runcorn, Cheshire, Analytical Chemist.
1892. Tatton, Reginald A., Mersey and Irwell Joint Committee, 44, Mosley Street, Manchester, Civil Engineer.
- O.M. Taubman, R., 12, Eton Road, Haverstock Hill, N.W., Analytical Chemist.
1905. Taveau, René de Mortemer, 1218, Mount Royal Avenue, Baltimore, Md., U.S.A., Research Assistant, Johns Hopkins University.
1898. Taverner, W., Ashland, Oregon, U.S.A., Analytical Chemist.
1901. Taylor, Jno. Bernard, Ivy Bank, Sandown Lane, Wavertree, Liverpool, Works Chemist.
1903. Taylor, Alvin M., c/o General Chemical Co., Hudson Heights, N.J., U.S.A., Chemist.
1902. Taylor, Arthur P., c/o John Taylor and Co., 531, Front Street East, Toronto, Ont., Canada, Soap Manufacturer.
1902. Taylor, Edward R., Penn Yan, N.Y., U.S.A., Manufacturing Chemist.
1902. Taylor, Francis O., c/o Parke, Davis and Co., Detroit, Mich., U.S.A., Analytical Chemist.
1886. Taylor, G. Crosland, Ravenscar, Helsby, near Warrington, Electrical Engineer.
1894. Taylor, G. Midgley, 27, Great George Street, Westminster, S.W., Analytical Chemist.
1893. Taylor, G. W., Dinting Vale Printworks, Dinting, near Manchester, Printworks Chemist.
- O.M. Taylor, H. E., 702, Alexandra Parade, Dennistown, Glasgow, Lead Works Manager.
1883. Taylor, Jas., Department of Mines, Sydney, N.S.W., Australia, Government Metallurgist.
1888. Taylor, Jas. Davis, 9, Mincing Lane, London, E.C., Chemical Merchant.
1898. Taylor, Jas. M., 59, Kenmare Road, Sefton Park, Liverpool, Analytical Chemist.
1901. Taylor, John, Crawford Institute, Emmett Place, Cork, Ireland, Science Master.
1901. Taylor, Jno., c/o Brotherton and Co., Ltd., Tar Works, Litherland, Liverpool, Chemist.
1888. Taylor, J. Scott, North London Colour Works, Kentish Town, N.W., Technical Chemist.
1896. Taylor, Martin, "The Clough," Buckhurst Hill, Essex, Chemical Works Manager.
1901. Taylor, M. J., 77, Front Street East, Toronto, Canada, Soap Manufacturer.
1898. Taylor, Newman, Chinchpoghley Road, Parel, Bombay, India, Resident Engineer.
1901. Taylor, Sidney H., 65, Newbridge Road, Weston, Bath, Works Chemist.
1902. Taylor, Thos., 12, Ancaster Drive, Great Western Road, Glasgow, Chemical Manufacturer.
1902. Taylor, Tom, jun., Journals to Kent House, Sale, Cheshire; communications to Cornbrook Chemical Co., Ltd., Stockport, Colour Manufacturer.
1898. Taylor, Walter, 20, Canning Street, Bury, Lancs., Technical Chemist.
1903. Tazaki, T. M., 15, Kamivoshicho, Asakusaku, Tokyo, Japan, Technical Chemist.
1887. Teanby, G. W. A., Elvin Lodge, East Dereham, Norfolk, Analytical Chemist.
1899. Teas, Wm. Holmes, Ridgeway, Pa., U.S.A., Chemist.
- O.M. Teed, Dr. F. L., Chem. Lab., 9, Mincing Lane, London, E.C., Analytical Chemist.
1904. Teller, George L., The Columbus Laboratories, 103, State Street, Chicago, Ill., U.S.A., Chemist.
- O.M. Tennant, Sir Chas., Bart., 40, Grosvenor Square, W.; Glen, Peebleshire, N.B., and Journals to St. Rollox, Glasgow, Alkali Manufacturer.
1881. Tennant, Jas., Alex. Fergusson and Co., Ltd., 38, McAlpine Street, Glasgow, Lead and Colour Manufacturer.
1896. Tennille, Geo. F., c/o Southern Cotton Oil Co., Savannah, Ga., U.S.A., Chemist.
1888. Terry, Albert, Verulam, Mount Albert Road, Balwyn, near Melbourne, Victoria, Brewer.
1884. Terry, Hubert L., 3, Herbert Street, Moss Side, Manchester, Technical Chemist.
- O.M. Tervet, R., 54, Penshurst Road, South Hackney, E., Oil Works Manager.
1902. Test, Wm., H., 716, Brown Street, Lafayette, Ind., U.S.A., Assistant Professor of Chemistry.
1893. Tetley, C. F., Messrs. Jos. Tetley and Son, The Brewery, Leeds, Brewer.
1897. Tetlow, Wm. E., Ash Cottage, Ashfield, Dunblane, N.B., Chemist.
1903. Thatcher, Ed. J., The Manor House, Chew Magna, near Bristol, Merchant and Manufacturer.
1903. Thayer, Harry M., c/o The Procter and Gamble Co., Ivorydale, Ohio, U.S.A., Chemist.
- O.M. Thomas, Chas., J.P., D.L., Pitch and Pay, Stoke Bishop, near Bristol, Soap Manufacturer.
1894. Thomas, H. Russell, Broad Plain Soap Works, Bristol, Soap Manufacturer.
1902. Thomas, Jas. E., Box 192, Germiston, Transvaal, South Africa, Cyanide Manager.
- O.M. Thomas, J. W., Overdale, Shortlands, Kent, Analytical Chemist.
1902. Thomas, Nehemiah M., Roseville Avenue, Pymble, N.S.W., Australia.

1901. Thomas, Octavius, Gas and Water Offices, Pentre, Glamorganshire, Gas and Water Engineer.
1888. Thomas, S. Percy, 2, Landrock Road, Hornsey, N., Technical Chemist.
1898. Thomas, Wm. Harrison, Jun., Passaic Print Works, Passaic, N.J., U.S.A., Printworks Chemist.
1885. Thompson, Prof. Claude M., 38, Park Place, Cardiff, Professor of Chemistry.
1898. Thompson, Edw. C., 40, Glenduce Road, Westcombe Park, S.E., Manufacturing Chemist.
1893. Thompson, G. Rudd, 69, Dock Street, Newport, Mon., Analytical and Consulting Chemist.
1895. Thompson, Gustave W., 129, York Street, Brooklyn, N.Y., U.S.A., Chemist.
1903. Thompson, J. Fairfield, Department of Metallurgy, Columbia University, New York City, U.S.A.
1903. Thompson, Jno. T., Corporation Sewage Works, Knostrop, Leeds, Analyst.
1885. Thompson, W., Sankey Hill, Earlestown, Lancashire, Sugar Refiner.
1884. Thompson, W. G., Colour Manufacturer.
- O.M. Thompson, W. P., Patent Office, 6, Lord Street, Liverpool, Patent Agent.
1896. Thomsen, Alonzo L., Maryland Club, 1, East Eager Street, Baltimore, Md., U.S.A., Manufacturing Chemist.
1902. Thomson, Allen B., c/o Spencer Chapman and Messel, Ltd., Silvertown, E., Chemical Engineer.
1884. Thomson, G. Carruthers, 53, Bedford Road, Rock Ferry, Birkenhead, Engineer.
1903. Thomson, G. M., 129, Moray Place West, Dunedin, New Zealand, Analyst.
1891. Thomson, Jas. M., Royal Gunpowder Factory, Waltham Abbey, Essex, Manager (Cordite Branch).
1884. Thomson, Robt. T., 156, Bath Street, Glasgow, Analytical Chemist.
1899. Thomson, Thos., Westlea; and (Journals) c/o Waterproofing Co., Barrhead, near Glasgow, Manufacturer.
- O.M. Thomson, W., Royal Institution Laboratory, Manchester, Analytical and Consulting Chemist.
1890. Thomson, Wm. Thos., Royal Gunpowder Factory, Waltham Abbey, Essex, Explosives Chemist.
1902. Thorburn, Jas., Reid's Villas, Stevenston, Ayrshire, N.B., Analytical Chemist.
- O.M. Thorne, Dr. L. T., 2, Denbigh Gardens, Richmond-on-Thames; and (Journals) Southampton Wharf, Battersea, S.W., Technical Chemist.
- O.M. Thorneycroft, Wallace, East Plean House, Bannockburn, N.B., Technical Chemist.
1904. Thornley, Thomas, Cross Chemical Co., Ltd., Camelon, Falkirk, N.B., Chemical Manufacturer.
1891. Thornton, Chris., 26, Larch Street, Providence, R.I., U.S.A., Printworks Manager.
1891. Thornton, David H., Brookfoot Dyeworks, Brighouse, Yorks., Dyer.
1887. Thornton, H., Redbourn, Ashford, Middlesex, Analytical Chemist.
1899. Thornton, Wm., (Journals) c/o Isaac Brandon and Bros., Panama, Central America; and (subs.) c/o Thos. Thornton, Hermand, West Calder, N.B., Chemist.
1895. Thorp, Dr. Frank H., Mass. Inst. of Technology, Boston, Mass., U.S.A., Assistant Professor of Industrial Chemistry.
- O.M. Thorpe, Dr. T. E., C.B., F.R.S., Government Laboratory, Clement's Inn Passage, Strand, W.C.; and (Journals) 61, Ladbroke Grove, Notting Hill, W., Chief Chemist (Customs and Inland Revenue).
1902. Thurlow, Nathaniel, 4, Union Place, Vonkers, N.Y., U.S.A., Chemist.
1898. Thurnauer, Dr. Gustav, c/o Aurora Metal Co., Aurora, Ill., U.S.A., Chemist.
1904. Thurston, Azor, Grand Rapids, Ohio, U.S.A., Chemist.
1904. Tickle, Thos., Laboratory, 83, Queen Street, Exeter, Analyst.
1903. Tighe, Arthur, 20, Marlborough Place, St. John's Wood, London, N.W., Chemical Student.
1901. Tilden, Philip S., c/o Franklin H. Kallbensch Co., 35, Barling Slip, New York City, U.S.A., Manufacturing Chemist.
- O.M. Tilden, Prof. W. A., F.R.S., The Oaks, Murray Road, Northwood, Middlesex, Professor of Chemistry.
1900. Tilley, Jas. W., 95A Southwark Street, London, S.E., Research Chemist.
1901. Timmans, W. G., c/o Gasford Chemical Co., Nottingham, Chemical Works Manager.
- O.M. Timmels, T. Sutton, Widnes, Chemical Manufacturer.
1894. Tipler, Fred. C., 48, Brooklyn Street, Crewe, Analytical Chemist.
1890. Tobey, C. H., Collingwood, Ontario, Canada, Tannery Chemist.
1894. Toch, Maximilian, 52, 9th Street, Long Island City, N.Y., U.S.A., Chemist.
1893. Tocher, Jas. F., 5, Chapel Street, Peterhead, N.B., Pharmaceutical Chemist.
1886. Todd, A. M., 204, North Rose Street, Kalamazoo, Mich., U.S.A., Manufacturing Chemist.
- O.M. Tomas, F. Woodland, States Analyst's Office, St. Heliers, Jersey, Analytical Chemist.
1902. Tone, Frank Jerome, c/o The Carborundum Co., Niagara Falls, N.Y., U.S.A., Manager.
1899. Tone, Jay E., 1427, Woodland Avenue, Des Moines, Iowa, U.S.A.
1896. Tonkin, John, 2603, East Broad Street, Richmond, Va., U.S.A., Manufacturing Chemist.
1902. Torrey, Charles A., Jun., 51, Wachusett Street, Worcester, Mass., U.S.A., Chemist.
- O.M. Towers, J. W., Brantwood, Allerton, near Liverpool, Analytical Chemist.
1903. Townsend, C. Eyre-Coote, 36, Glenduce Road, Blackheath, S.E., Commission Agent.
1892. Townsend, Chas. W., 19, Crawford Street, Port Dundas, Glasgow, Chemical Manufacturer.
1892. Townsend, Oliver C., New Bilton, Rugby, Chemical Manufacturer.
1897. Towse, Walter, 12, Normanton Terrace, Newcastle-on-Tyne, Technical Chemist.
1904. Toyne, Francis D., 95, Goldsmith Street, Nottingham, Chemist.
1899. Trantom, Dr. Wm., Haslemere, Maltman's Road, Lymn, near Warrington, Chemist.
1894. Traphagen, Dr. Frank W., Colorado School of Mines, Golden, Colo., U.S.A., Professor of Metallurgy and Assaying.
1900. Traquair, Jno., Glenfield Starch Works, Paisley, N.B., Analytical Chemist.
1904. Trantwein, Alfred P., Carbondale, Pa., U.S.A., President (Carbondale Chemical Co.).
1893. Travers, Dr. Morris W., F.R.S., University College, Bristol, Prof. of Chemistry.
1889. Trechmann, A. O., Halling Lime and Cement Works, near Rochester, Kent, Cement Manufacturer.
1885. Trechmann, Dr. C. O., Warren Cement Works, Hartlepool, Cement Manufacturer.
1895. Treharne, F. Gwilym, Wrangbrook, Llanishen, near Cardiff, Analytical Chemist.
1885. Trewby, Herbert, 62, St. John Street, London, E.C., Analytical Chemist.
1901. Trigger, Oliver, Chem. Dept., Royal Arsenal, Woolwich, S.E., Analytical Chemist.
1898. Tripp, Dr. E. Howard, The Modern School, Bedford, Science Master.
- O.M. Trobridge, A., c/o Trobridge and Co., Ltd., South Shore Road, Gateshead-on-Tyne, Technical Chemist.
1897. Trotman, Saml. R., King's Walk Chambers, Parliament Street, Nottingham, City Analyst.
1904. Trubek, M., Wood Ridge, Bergen County, N.J., U.S.A., Manufacturing Chemist.
1900. True, Percival E., Bowker Chemical Co., Elizabeth, N.J., U.S.A., Chemical Engineer.
1887. Tsukiyama, S., Nippon Seito Kaisha, Osaka, Japan, Paper Mills Chemist.
1894. Tucker, Alex. E., Norwich Union Chambers, Congreve Street, Birmingham, Metallurgist and Chemist.
1897. Tucker, Samuel A., Columbia University, New York City, U.S.A., Tutor in Industrial Chemistry.

1886. Tuer, Arthur H., Thornhill, near Wigan, Analytical Chemist.
1903. Tufts, C. G., c/o Somet-Solvay Co., Syracuse, N.Y., U.S.A., Chemical Engineer.
1901. Tulloch, Wm. F., 7, West George Street, Glasgow, Merchant.
1904. Tunnell, Raymond W., 425, West Walnut Lane, Germantown, Philadelphia, Pa., U.S.A., Manufacturer.
1899. Turnbull, Dr. Andrew, Manchester and Liverpool District Tanners' Federation, 3, Lord Street, Liverpool, Consulting Chemist.
1888. Turnbull, G. W., 2, Haws Hill, Carnforth, Lancashire, Metallurgical Chemist.
1903. Turnbull, John, 66, Jarvis Street, Toronto, Canada, Manufacturer of Food Products.
1904. Turnbull, R. H., c/o MacAndrews and Forbes Co., Smyrna, Asia Minor, Analytical Chemist.
1884. Turnbull, W. S., 37, West George Street, Glasgow, Chemical Manufacturer.
1902. Turner, Basil, 5, Moore Street, Sydney, N.S.W., Australia, Metallurgist.
1902. Turner, Jos., c/o Road Holiday, and Sons, Ltd., Huddersfield, Chemist.
1897. Turney, Fred. N., Saventham, near Brussels, Belgium, Leather Dresser.
1887. Turney, Sir J., Springfield, Alexandra Park, Nottingham, Tanner.
1903. Tutton, Henry Ralph, 19, St. James' Parade, Bath; and (Journals) c/o Burham Cement Works, Aylesford, Kent, Chemist.
1890. Tweedy, Jas., 306A, Burdett Road, Linchouse, E., Metallurgical Chemist.
1891. Twitchell, E., Wyoming, Ohio, U.S.A., Candle Works Manager.
1897. Twynam, H., c/o Mount Morgan Gold Mining Co., Mount Morgan, Queensland, Australia, Mining Engineer.
- O.M. Twynam, T., Hawthorne House, Slaid Hill, Moor-town, Leeds, Metallurgist.
1904. Tyler, Chas. R., c/o Dr. Francis Wyatt, 402, West 23rd Street, New York City, U.S.A., Analytical Chemist.
- O.M. Typke, P. G. W., Lawn House, New Malden, Surrey, Chemical Manufacturer.
1893. Tyrer, Chas. T., Stirling Chemical Works, Stratford, E., Manufacturing Chemist.
- O.M. Tyrer, T., Stirling Chemical Works, Stratford, E., Chemical Manufacturer.
1899. Tysoe, Jos., South Metropolitan Gas Co., East Greenwich, S.E., M.Inst.C.E., Gas Engineer.

U

1894. Uhlig, E. C., Fulton Gas Works, Nevins and Degraw Streets, Brooklyn, N.Y., U.S.A., Chemist.
1900. Uhlig, W. C., c/o Hygeia Distilled Water Co., 349, West 12th Street, New York City, U.S.A., Chemist.
1897. Ullman, Jas. A., c/o Sigmund Ullman Co., 146th Street, and Park Avenue, New York City, U.S.A., Printing Ink Manufacturer.
1900. Ulmer, Geo. F., c/o Arbuckle Bros., Sugar Refinery, Foot of Pearl Street, Brooklyn, N.Y., U.S.A., Chemist.
- O.M. Umney, C., (Journals) 81, Lawrie Park Road, Sydenham, and (communications) 50, Southwark Street, London, S.E., Manufacturing Chemist.
1889. Underhill, Thos. J., 73, Peppys Road, New Cross, S.E., Inspector of Stores.
1885. Underwood, G. R., 4, Emerson Street, Peabody, Mass., U.S.A., Glue Works Chemist.
1898. Unglaub, Oscar, Ban Hill House, Bolton Road, Pendleton, Manchester, Soap Manufacturer.
1883. Usnar, J. H., 22, Billiter Street, London, E.C., Chemical Merchant.
1904. Uyeda, Toyokitsu, Takasago, Harima, Japan, Chemist.

V

1904. Valk, S. J., 158, Franklin Street, New York City, U.S.A., Manufacturer.
1905. Van Arsdale, G. D., c/o Copper Queen Consolidated Mining Co., 99, John Street, New York City, U.S.A., Chemist.
1904. Vandenbergh, Dr. E. P., Pelham Manor, Westchester Co., N.Y., U.S.A., Consulting Chemist.
1896. Van der Linde, Harold, 47, Front Street West, and (Journals) 101, Tyndall Avenue, Toronto, Canada, Chemist (India-rubber and Gutta-percha Manufacturing Co.).
1895. Vanderpool, Dr. Frank, 153, Center Street, Orange, N.J., U.S.A., Chemist.
1904. Van Duzen, Dr. Harlan P., 232, Gt. Portland Street, London, W., Doctor of Medicine.
1903. Van Dyck, Edwin M., Bureau of Engraving and Printing, Washington, D.C., U.S.A., Chemist and Ink Maker.
1897. Van Gelder, Arthur P., c/o Climax Powder Manufacturing Co., Emporium, Pa., U.S.A., Superintendent.
1903. Van Gilder, H. P., 234, Bushkill Street, Easton, Pa., U.S.A., Analytical Chemist.
1891. Van Gundy, Chas. P., Laboratory, B. and O. R. R., Baltimore, Md., U.S.A., Metallurgical Chemist.
1896. Van Ingen, Dudley A., Palmerton, Carbon Co., Pa., U.S.A., Chemist.
1896. Van Laer, Norbert, Truman's Brewery, Burton-on Trent, Brewer and Chemist.
1897. Van Marken, J. C., Repelen bei Moers, Germany, Chemical Engineer.
1902. Vanwinckel, W. H., c/o Lyman Bros. and Co., Ltd., 71, Front Street East, Toronto, Canada, Chemist.
1888. Vargas-Vergara, J. M., Apartado No. 237, Bogota, Colombia, S. America, Metallurgical Chemist.
- O.M. Vasey, T. E., Chemical Engineer.
1894. Veitch, Geo., Chemical Works, Crieff, N.B., Manufacturing Chemist.
1898. Verity, Ben, Magog, Prov. Quebec, Canada, Print Works Chemist.
1897. Verity, Victor, 83, Lexington Street, East Boston, Mass., U.S.A., Chemical Works Foreman.
1904. Vernon, R. H., Cornell University, Ithaca, N.Y., U.S.A., Student.
- O.M. Vickers, Wm., c/o Thos. Vickers and Sons, Miles Platting, Manchester, Chemical Manufacturer.
1895. Vigelius, Carl, 175, Pearl Street, New York City, U.S.A., Shellac Bleacher.
1896. Vincent, Jos. A., Rooms 207-8, 421, Chestnut Street, Philadelphia, Pa., U.S.A., Mechanical Engineer.
1897. Vlies, Leonard E., Fernroyd, Wellington Road, Whalley Range, Manchester.
- O.M. Voelcker, E. W., 22, Tudor Street, London, E.C., Agricultural Chemist.
1887. Voelcker, Dr. J. A., 20, Upper Phillimore Gardens, Kensington, W., Agricultural Chemist.
1901. Vogel, G. C., 583, Cass Street, Milwaukee, Wis., U.S.A., Tanner.
1897. Vogel, Julius L., 91, Blackfriars Road, London, S.E., Engineer.
1899. Vogeler, Gustav, 17, Philpot Lane, London, E.C., Merchant.
1900. Volney, Dr. Carl W., Keyport, N.J., U.S.A., Chemist (Smokeless Powder Co.).
1897. Voorhees, Louis A., Box 55, New Brunswick, N.J., U.S.A., Agricultural Chemist.
1899. Voorhees, Samuel S., c/o Supt. Architect, Treasury, Washington, D.C., U.S.A., Chemist.
1902. Vorisek, Dr. Anton, College of Pharmacy, 115-119, West 68th Street, New York City, U.S.A., Instructor.
1888. Vörster, Fritz, Cöln-Marienburg, Germany, Manufacturing Chemist.
1885. Voss, Hermann, 19, Beckenham Road, Beckenham, Kent, Manure Works Manager.
1899. Voss, Walter A., Eastwood Road, Rayleigh, Essex, Manufacturing Chemist.
1899. Vreeland, Cornelius D., Upper Montclair, N.J., U.S.A., Manufacturing Chemist.

W

1896. Wachtel, Gregory, 6, Manejny Perendok, St. Petersburg, Russia, Chemical Engineer.
1904. Wackeureuter, A. G., 134 E36, Kinzie Street, Chicago, Ill., U.S.A., Colour Manufacturer.
1895. Waddington, Thos. W., 71, Blackburn Road, Padiham, Lancashire, River Inspector.
1902. Wade, Frank, 44, Beech Farm Road, Southsea, Analytical Chemist.
1890. Wade, Jas. L., 28, West Kensington Gardens, London, W., Chemical Manufacturer.
1889. Wadman, W. E., 102, Lord Avenue, Bayonne, N.J., U.S.A., Manufacturing Chemist.
1897. Wagner, Dr. Theodore E., 1414, Wilson Avenue, Chicago, Ill., U.S.A., Chemist.
1893. Wagner, W. G., 12, North Common Road, Eding. W., Manufacturing Chemist.
1903. Wainwright, J., 15, Bolton Road, Port Sunlight, near Birkenhead, Soap Works Manager.
1884. Wainwright, Dr. J. H., 159, Front Street, New York City, U.S.A., Analytical Chemist.
1895. Wainwright, Wm., c/o Spooner and Bailey, Manure Works, Eling, near Southampton, Chemist.
1904. Wait, Walter S., 30, Kilby Street, Boston, Mass., U.S.A., Chemist.
1901. Waite, C. Nelson, c/o General Artificial Silk Co., 32, South Broad Street, Philadelphia, Pa., U.S.A., Chemist.
1899. Wakefield, Wm. C., c/o Savile Town Chemical Co., Ltd., Savile Town, Dewsbury, Chemist.
1894. Waldman, Louis J., P.O. Box 162, Albany, N.Y., U.S.A., Aniline Dye Manufacturer.
1895. Waldstein, Dr. Martin E., 107, Murray Street, New York City, U.S.A., Manufacturing Chemist.
1887. Walker, Archibald, 8, Crown Terrace, Glasgow, Distiller.
1897. Walker, H. V., 700, Park Place, Brooklyn, N.Y., U.S.A., Chemist.
1894. Walker, Dr. Jas., University College, Dundee, Professor of Chemistry.
1902. Walker, Jas., Knowle House, Mirfield, Yorks., Woollen Manufacturer.
1897. Walker, Jas. W., Castle Park, Irvine, N.B., Chemical Manufacturer.
1902. Walker, Jno. H., Gourepore Works, Naihati, E.B.S.R., Bengal, India, Chemist.
1904. Walker, John P., c/o B. and M. Smelter, Great Falls, Montana, U.S.A., Metallurgical Chemist.
1884. Walker, S. R., 19, Wolsey Street, Radcliffe, Manchester, Foreman Dyer.
1895. Walker, W. Sloane, c/o Walker, Ltd., Litherland, near Liverpool, Tanner.
1900. Walker, Dr. Wm. H., Massachusetts Inst. of Technology, Boston, Mass., U.S.A., Chemical Expert.
1897. Wallace, Edwin C., P.O. Box 42, Cambridgeport, Mass., U.S.A., Chemist.
1897. Wallace, Robt. A., 58, Abinger Road, Bedford Park, W., Chemical Manufacturer.
1883. Wallace, Robert, 20, Murrayfield Avenue, Edinburgh, Distiller.
- O.M. Waller, Dr. Elwyn, 7, Franklin Place, Morristown, N.J., U.S.A., Professor of Chemistry.
1899. Wallerstein, Dr. Max, 105, East 91st Street, New York City, U.S.A., Chemist.
1886. Walsh, F. T., 195, Nesmith Street, Lowell, Mass., U.S.A., Colour Printer.
1901. Walsh, Lionel O. P., c/o Burt, Boulton and Haywood, Ltd., Prince Regent's Wharf, Silvertown, E., Chemist.
1903. Walsh, Peter H., P.O. Box 469, Magog, Quebec, Canada, Analytical Chemist.
1904. Walther, Wm., Holzapfel's Compositions Co., Ltd., Heworth Shore, Felling-on-Tyne, Chemist and Works Manager.
1902. Walton, Thos. U., Colonial Sugar Refining Co., Ltd., O'Connell Street, Sydney, N.S.W., Australia, Analytical Chemist.
1895. Want, W. Philip, 44, Bishopsgate Street Without, London, E.C., Pharmacist and Editor.
1901. Warburton, Frank, 5, Rosebery Gardens, Muswell Hill, N., Manager.
1901. Warburton, George H., 33, Kilburn Priory, West Hampstead, N.W., Analytical Chemist.
1896. Warburton, Thos., 7, Cambridge Street, Stockport Road, Manchester, Chemist.
1903. Ward, Dudley R., 251, Peckham Rye, London, S.E., Analytical Chemist.
- O.M. Ward, Geo., Messrs. Hirst, Brooker, and Hirst, Ltd., Millgate Mills, Leeds, Chemical Manufacturer.
1891. Ward, G. J., The Cottage, Hallam Fields, near Nottingham, Civil Engineer.
1884. Ward, Howard Chas., Veatton, Hordle, Lynnington, Hants, Deputy Chairman of Gas Co.
1898. Ward, John, Barnstone Blue Lias Lime Co., Ltd., Barnstone, Notts., Manager.
1894. Ward, Wm. J., Raglitt, North Wales, Chemist.
1892. Warden, Jno. E., Sevier Mine, Kimberley, Utah, U.S.A., Analytical Chemist.
1897. Wardle, Sir Thos., 54, St. Edward Street, Leek, Staffordshire, Silk Dyer.
1902. Waring, W. Geo., Webb City, Mo., U.S.A., Metallurgical Chemist.
1899. Warnes, Arthur R., c/o T. W. Willson, 117, Boyson Road, Cumberland Gate, S.E., Soapworks Chemist.
1890. Warren, Fiske, c/o S. D. Warren and Co., Cumberland Mills, Me., U.S.A., Paper Manufacturer.
1902. Warren, H. D., The Gutta Percha and Rubber Manufacturing Co., Ltd., 15-19, West Front Street, Toronto, Canada, President.
1890. Warren, Jno. Davis, 7, Essex Road, Acton, W., Manufacturing Chemist.
1901. Warren, Jno. E., Eagle Chemical Works, Barchester Street, Poplar, E., Tar Distiller.
1885. Waterfall, W. E., c/o Avon Manure Co., Bristol; and (Journals) Thirlmere, Clavering Road, Redland, Bristol, Manure Manufacturer.
1890. Waterhouse, Major General Jas., Oak Lodge, Court Road, Eltham, Kent, Assistant Surveyor-General of India (retired).
1891. Waterhouse, Robt., 7, Lyne Grove, Altrincham, Cheshire, Analytical and Agricultural Chemist.
1902. Watkins, E. J., (communications) 81, Montpelier Road; (Journals) c/o Mellin's Food, Ltd., Stafford Street, Peckham, S.E., Works Chemist.
1900. Watkins, Norman, (communications) Box 767, and (Journals) 1701, Makiki Street, Honolulu, Hawaiian Islands, Chemist.
1898. Watkins, Willard H., c/o Schoellkopf, Hartford and Hanna Co., 36, Purchase Street, Boston, Mass., U.S.A., Chemist.
1894. Watmough, Benj., 1, Ryeburn, Stanley Road; and (Journals) c/o Brotherton and Co., Ltd., Ammonia Works, Wakefield, Chemist.
1894. Watson, Alex. Forbes, St. James's Gate Brewery, Laboratory, Watling Street, Dublin, Chemist.
1884. Watson, Chas., Dawsonholm Chemical Works, Maryhill, Glasgow, Manufacturing Chemist.
1894. Watson, Chas. Ernest, 28, Highfield Road, Stretford, Manchester, Chemical Assistant.
1890. Watson, Eric E., (Journals) The Queensland Smelting Co., Aldershot, Maryborough, Queensland, Australia; (subs.) c/o S. Watson, Queen Insurance Buildings, Dale Street, Liverpool, Chemist.
1895. Watson, H. Ard, c/o Tunstall and Co., Ltd., Leeds Bridge, Leeds, Tar Distiller.
1901. Watson, Herbert J., Glenarm Villas, Cavendish Street, Mansfield, Notts., Chemist.
1903. Watson, H. M., 22, Coleraine Road, Blackheath, S.E., Paint Manufacturer.
1903. Watson, H. W., 111, Erdeneil Road, Hyde Park, Leeds, Analytical Chemist.
1894. Watson, Jas., 60, West Park Terrace, South Shields, Alkali Works Manager.
- O.M. Watson, Jno., c/o City and Surlaban Gold Mining Co., Box 1026, Johannesburg, Transvaal, South Africa, Technical Chemist.
- O.M. Watson, Jno. C., Schluesselberg, near St. Petersburg, Russia, Manager of Printworks.
1891. Watson, Jno., 56, Cantwell Road, Woolwich Common, S.E., Analytical Chemist.
1904. Watson, Percy, 554, Somerset Avenue, Taunton, Mass., U.S.A., Chemist and Dyer.
- O.M. Watt, A., c/o Macfie and Sons, 34, Moorfields, Liverpool, Sugar Works Chemist.

1901. Watt, Francis L., 10, Northcote Chambers, Reilly Lane, Circular Quay, Sydney, N.S.W., Australia, Student.
1901. Watt, John, 17, Maple Avenue, Toronto, Ont., Canada, Glass Manufacturer.
1900. Watts, Chas. J., 40, City Road, London, E.C., Manufacturer.
1893. Watts, Jno. Isaac, Fairleigh, Hartford, Cheshire, Alkali Works Manager.
1903. Wayland, Wm. A., 12, Albert Road, Brockley, S.E., Manufacturing Chemist.
1900. Webb, Jno. E., 20, Louvaine Road, St. John's Hill, Battersea, S.W., Mining and Electrical Engineer.
1901. Webb, Wm. J., 26, Livingston Avenue, Yonkers, N.Y., U.S.A., Superintendent of Printing Department.
1884. Webster, C. S. Stanford, Malvern House, Redland, Bristol, Consulting and Analytical Chemist.
1901. Webster, Geo. J., Standard Chemical Co., Ltd., Gooderham Building, Toronto, Canada, Secretary.
1902. Webster, Jno., Chemical Laboratory, Guy's Hospital, London, S.E., Analyst.
1904. Wedekind, Rud., Verdlingen am Rhein, Germany, Manufacturer of Alizarin and Bichromates.
1897. Wedge, Uley, Pennsylvania Salt Manufacturing Co., Philadelphia, Pa., U.S.A., Chemist.
1902. Weed, Hy. T., 408, Third Street, Brooklyn, N.Y., U.S.A., Teacher of Chemistry.
1893. Weeks, H. B., 2, Infield Park Road, Barrow-in-Furness, Analytical Chemist.
1895. Weems, Dr. J. B., Iowa Agricultural College, Ames, Iowa, U.S.A., Agricultural Chemist.
1898. Weepie, Lawrence, Pinchin's Wharf, Stratford, E., Colour Works Chemist.
1904. Weightman, Aubrey H., 1915, Walnut Street, Philadelphia, Pa., U.S.A., Chemical Manufacturer.
1904. Weil, Jacob A., c/o The Power Gas Corporation, Ltd., 39, Victoria Street, Westminster, S.W., Chemist.
1902. Weiskopf, Erich, Dynamite Factory, Modderfontein, Transvaal, South Africa, Chemist.
1902. Weiss, Georg A., Chemische Fabrik, Ahlden a. Aller, Hanover, Germany, Chemical Manufacturer.
1893. Welch, J. Outhbert, Montreal and Boston Cons. Mining and Smelting Co., Boundary Falls, B.C., Canada, Chemist and Metallurgist.
1899. Weldon, Leonard E., 44, Central Avenue, New Basford, Nottingham, Dyer.
1903. Wellcome, Henry S., Snow Hill Buildings, London, E.C., Manufacturing Chemist.
1891. Wells, Jas. Gray, Trent House, Branton, Burton-on-Trent, Brewing Chemist.
1894. Wells, Pierson L., 86, Joralemon Street, Brooklyn, N.Y., U.S.A., Patent Lawyer and Engineer.
1885. Welsh, Jas., Horrocks Lane Dyeworks, Red Bank, Manchester, Printworks Manager.
1890. Welsh, Thos. L., 3, Prince's Gardens, Dowanhill, Glasgow, Analytical Chemist.
- O.M. Welsh, W., Holt Town, Manchester.
1905. Welt, Dr. Ida, 73, West 83rd Street, New York City, U.S.A., Chemist.
1897. Wense, Dr. W., c/o Herrn H. Schultz, Graalstrasse, Lüneburg, Germany, Manager.
1890. Werner, Emil A., 5, Church Avenue, Rathmines, Dublin, Chemical Demonstrator.
1903. Wesener, Dr. John A., 103, State Street, Chicago, Ill., U.S.A., Consulting Chemist.
1884. Wessel, Carl, (communications) Geheimer Commerzienrath C. Wessel, Bernburg; and (Journals), Deutsche Solvay-Werke Act.-Ges., Bernburg, Anhalt, Germany, Alkali Manufacturer.
1889. Wesson, D., c/o Southern Cotton Oil Co., 24, Broad Street, New York City, U.S.A., Technical Chemist and Cotton-Oil Expert.
1903. West, Leonard, 203, Uttoxeter New Road, Derby, Manufacturing Chemist.
1900. Westenfelder, B. D., 924, Clinton Street, Cincinnati, Ohio, U.S.A., Chemist.
1885. Westmoreland, J. W., 3, Love Lane, Eastcheap, London, E.C., Metallurgical Chemist.
1898. Weston, David B., Box 503, Sharon, Mass., U.S.A., Chemist.
1894. Weston, Robt. S., 14, Beacon Street, Boston, Mass., U.S.A., Chemist and Bacteriologist.
1904. Weston, Thos. W., c/o Jos. Watson and Sons, Whitehall Soap Works, Leeds, Mechanical Engineer.
1885. Weston, Wm., 17, St. David's Road, Southsea, Analytical Chemist.
1902. Wethered, Wm. P., Redcourt, Carnatic Road, Mossley Hill, Liverpool, Manager.
1890. Wetter, Jasper, 37-39, Essex Street, Strand, London, W.C., Patent Agent.
- O.M. Whalley, L. J. de, 172, Erlanger Road, New Cross, S.E., Sugar Chemist.
1904. Whatmough, Dr. Wm. H., Woodleigh, Cheadle, Cheshire, Chemist.
1904. Wheawill, Cornelius, 11, Westbourne Road, Huddersfield, Chartered Accountant.
1898. Wheeler, Edw. J., 79, Chapel Street, Albany, N.Y., U.S.A., Analytical Chemist.
1903. Wheeler, Ernest, 335, Park Road, Oldham, Lancashire, Metallurgical Chemist.
1895. Wheelwright, Dr. E. W., Greenholme, Westfield Road, Acoc's Green, near Birmingham.
1904. Wherry, B. P., c/o Boston and Montana Smelter, Great Falls, Mont., U.S.A., Chemical Engineer.
1898. Whicelo, Matthew A., 9, Eversfield Road, Eastbourne, Aerated Water Manufacturer.
- O.M. Whiffen, Thos. J., Harefield, Southfields, S.W., Manufacturing Chemist.
- O.M. Whiffen, W. G., Lombard Road, Battersea, London, S.W., Manufacturing Chemist.
1902. Whipple, G. C., St. Paul Building, 220 Broadway, New York City, U.S.A., Chemist.
1893. Whitaker, Alf., Newlaithes Grange, Horsforth, Leeds, Dyer.
1899. Whitaker, Milton C., c/o Welsbach Light Co., Gloucester City, N.J., U.S.A., Chemist.
1895. Whitaker, Thos., Newlay Hall, near Leeds, Dyer.
- O.M. Whitaker, Thorpe, (Journals) Bradford Dyers' Association, Ltd., and 35, Pemberton Drive, Bradford, Yorks, Dyer's Chemist.
- O.M. White, A. Dowler, 65, Cedar Gardens, Deodar Road, Putney, London, S.W., Chemical Manufacturer.
1898. White, Alf. B., 1017, Hill Street, Ann Arbor, Mich., U.S.A., Instructor in Chemical Technology.
1893. White, Arthur F., 30, Cornwall Terrace, Manningham, Bradford, Yorks., Manufacturing Druggist.
1902. White, Geo. Arthur, P.O. Box 70, Vandergrift, Pa., U.S.A., Chemist.
1901. White, H. Graham, 24, Bidston Road, Oxtun, Birkenhead, Works Chemist.
1889. White, Henry, 245, Western Road, Crookes, Sheffield, Manufacturing Chemist.
1887. White, J. Campbell. See Overtoun, Lord.
1898. White, Jno., County Offices, St. Mary's Gate, Derby, Public Analyst to County of Derby.
- O.M. White, Paul T., Horton Field House, West Drayton, Chemical Manufacturer.
1894. White, W. Gilchrist, Springhill, Port Glasgow, N.B., Calico Printer's Chemist.
1903. Whitehouse, P. L., 10, Victoria Street, West Bromwich, Staffordshire, Oil Chemist.
1885. Whiteley, R. Lloyd, 5, Bagnall Street, West Bromwich, Staffordshire, Chemical Lecturer.
1892. Whiteside, Jno. L., 376, St. Helen's Road, Bolton-le-Moors, Chemical Lecturer.
1885. Whittaker, C. J., West Bank, Lytham, Lancashire, Chemical Engineer.
1904. Whittier, Charles T., 322, Warren Street, Jersey City, N.J., U.S.A., Manager.
1901. Whitton, Jas. T., c/o Nobel's Explosives Co., Ltd., Ardeer, Stevenston, N.B., Chemist.
1884. Whowell, F., Wood End, Bromley Cross, Bolton, Lancs., Bleacher.
1899. Wiarda, Jno. C., 259-273, Green Street, Brooklyn, N.Y., U.S.A., Manufacturing Chemist.
1897. Wiborg, E. B., The Ault and Wiborg Co., Cincinnati, Ohio, U.S.A., Manufacturer.
1890. Wickens, B. Foster, 31, Bermondsey Wall, London, S.E., Managing Director (Wickens, Pease and Co., Ltd.).
1905. Widmann, Eugene A., 866, Park Place, Brooklyn, N.Y., U.S.A., Dyestuff Merchant.

1887. Wielandt, Dr. Wm., Kalkreuthstrasse 1, Berlin, W., Germany, Chemist.
1904. Wieler, Eric E., 4, Palatine Road, Withington, Manchester, Chemical Merchant.
1904. Wiener, William, 621, Nelson Place, Newark, N.J., U.S.A., Analytical and Consulting Chemist.
1904. Wigg, Chas. E., c/o The Hull and Liverpool Red Oxide Co., Peasley Cross, St. Helens, Lancashire.
1883. Wiggins, W. W., Wiggin Street, Birmingham Heath, Birmingham, Nickel Refiner.
1904. Wigglesworth, Edwin, c/o General Chemical Co., 25, Broad Street, New York City, U.S.A., Manufacturing Chemist.
1897. Wigglesworth, Henry, 25, Broad Street, New York City, U.S.A., Manufacturing Chemist.
- O.M. Wightman, C. I., Fenchurch Avenue, London, E.C., Chemical Merchant.
1904. Wild, Irving L., 235, College Street, Middletown, Conn., U.S.A., Electrical Engineer.
1899. Wild, Ronald C., The Grange, New Eltham, Kent., Analytical Chemist.
1893. Wilder, P. L., Morro Velho, Villa Nova de Lima, Estado de Minas Geraes, Brazil, Assayer.
1902. Wilder, Salmon W., Jun., c/o Merrimac Chemical Co., North Woburn, Mass., U.S.A., Treasurer.
1899. Wildman, Arthur J., 17, Streathfield Avenue, East Ham, E., Chemist.
1902. Wiley, Dr. Harvey W., Bureau of Chemistry, Department of Agriculture, Washington, D.C., U.S.A., Chief.
1903. Wilkie, Jno. M., 12, Chantry Road, West Bridgford, Nottingham, Analytical Chemist.
1885. Wilkin, Sir Walter, K.C.M.G., Appold Street, Finsbury, E.C., Yeast Manufacturer.
1901. Wilkins, Albert D., Bellevue P.O. Station, Allegheny, Pa., U.S.A., Chemist.
1895. Wilkins, Charles, 40, Church Lane, Hornsey, N., Manufacturing Perfumer.
1899. Wilkins, H. A. J., c/o New Jersey Zinc Co., 71, Broadway, New York City, U.S.A., Mining Engineer.
1904. Wilkinson, Prof. J. A., Transvaal Technical Institute, P.O. Box 1176, Johannesburg, Transvaal, Professor of Chemistry.
1886. Wilkinson, J. B., Tong Street, Dudley Hill, Bradford, Yorks., Chemical Manufacturer.
1884. Will, W. Watson, 162, Kennington Park Road, London, S.E., Professor of Organic Chemistry.
1903. Willard, C. T., c/o Singer Manufacturing Co., Elizabethport, N.J., U.S.A., Chemist.
1893. Willcox, Benjamin, 47, Lincoln's Inn Fields, London, W.C., Patent Agent.
1900. Willenz, Dr. Michel, Rue Haringrode 4, Antwerp, Belgium, Leather Trades Chemist.
1903. Williams, Chas. Ed., Thornhayes, Steaford, Seed Crusher.
1895. Williams, David T., 9, Calvert Terrace, Swansea, Chemist.
1903. Williams, Harvey L., P.O. Box 410, Bristol, Tenn., U.S.A., Manufacturer of Barium Salts.
1891. Williams, Henry J., 161, Tremont Street, Boston, Mass., U.S.A., Chemical Engineer.
1904. Williams, Jno. T., Lord's Court Building, 27, William Street, New York City, U.S.A.,
1896. Williams, Jno. Taylor, 2, Queen Street, Wellington, Salop, Brewer.
1904. Williams, Naboth, 28, Rolleston Street, Warrington, Technical Chemist.
1902. Williams, Percy, British Uralite Co., Ltd., Higham, near Rochester, Kent, Chemist.
1885. Williams, Rowland, Hale Cote, Albert Park, Lancaster, Analytical Chemist.
1900. Williams, Saml. H., Glastonbury, Conn., U.S.A., Soap Manufacturer.
1903. Williams, S. M., 269, Springdale Avenue, East Orange, N.J., U.S.A., Chemist.
1885. Williams, T. Howell. See Idris, T. H. W.
1884. Williams, Prof. W. Carleton, Broomgrove, Goring-on-Thames, Professor of Chemistry.
1902. Williams, Walter Scott, Arnold Printworks, North Adams, Mass., U.S.A., Chemical Engineer.
1887. Williams, W. Collingwood, 68, Grove Street, Liverpool, Analytical Chemist.
- O.M. Williams, W. J., 5001, Franklin Street, Frankfurt, Philadelphia, Pa., U.S.A., Analytical Chemist.
1899. Williamson, G. N., 14, Dey Street, New York City, U.S.A., Manufacturing Chemist.
1894. Williamson, J. Alex., 16, Milton Avenue, Highgate, N., Analytical Chemist.
- O.M. Williamson, Robt., Low Walker, Newcastle-on-Tyne, Technical Chemist.
1903. Willis, J. L., 133, Midwood Street, Brooklyn, N.Y., U.S.A., Technical Chemist.
1895. Willson, Thos., Lt., St. Catherine's, Ont., Canada, Electrical Engineer.
1891. Wilson, A. Poole, 81, Botanic Road, Glasnevin, Dublin, Ireland, Analytical Chemist.
1890. Wilson, Alf., c/o Messrs. J. and E. Sturge, 18, Wheeley's Lane, Birmingham, Chemist.
1884. Wilson, Anthony W., 20, Westcott Street, Hull, Colour Works Manager.
1888. Wilson, Cecil H., c/o Sheffield Smelting Co., Ltd., Royds Mills Street, Sheffield, Chemist.
- O.M. Wilson, C. J., 14, Old Queen Street, Westminster, S.W.,
1888. Wilson, David, Jun., Carbeth, Killearn, by Glasgow.
1885. Wilson, Frank, 7, Bedford Square, London, W.C., Brewer.
1903. Wilson, Geo. C., Mysore Gold Mines, Marikuppam, Mysore State, India, Chemist.
- O.M. Wilson, G. E., The Chemical Works, Oldbury, near Birmingham, Chemical Manufacturer.
1902. Wilson, Geo. W., 18, Dinting Vale, Dinting, near Manchester, Works Chemist.
1899. Wilson, Gordon, Benallan, Kirkintilloch, N.B.; and (Journals) Promontorio, Estacion Chinacates, Durango, Mexico, Chemist and Assayer.
1886. Wilson, Jno., Tyneside, Hagley Road, Birmingham, Technical Chemist.
1896. Wilson, Jno., The Vines, Oxford Road, Runcorn, Chemical Engineer.
1902. Wilson, Jno. B., Mount Morgan Gold Mining Co., Mount Morgan, Queensland, Australia, Mining Engineer.
- O.M. Wilson, J. H., 6, Fenchurch Buildings, London, E.C., Chemical Manufacturer.
1902. Wilson, Leonard P., Stocksfield, Church Road North, Harewell, W., Technical Chemist.
- O.M. Wilson, R. H., Eaglescliffe, R.S.O., Co. Durham, Chemical Manufacturer.
1900. Wilson, Walter A., Ardeer, Stevenston, Ayrshire.
1885. Wilson, Dr. W. H., Presidency College, Madras, India, Lecturer on Physics.
1890. Wilson, W. W., The Grange, Carbrook, near Stalybridge, Analytical Chemist.
1884. Wilton, Thos., Winsor House, Beckton, E., Tar Works Manager.
1901. Wing, Herbert H., Monticello, N.Y., U.S.A., Chemical Engineer.
1892. Wing, J. D., 22, William Street, New York City, U.S.A., Merchant.
1893. Wingate, Hamilton M., 90, Queenswood Road, Forest Hill, S.E., Technical Chemist and Metallurgist.
1892. Wingfield, T. R., 5, Bromwich Street, Bolton, Brewer.
- O.M. Wingham, A., Livermead House, Torquay, Metallurgical Chemist.
- O.M. Winsor, P. J., Moor House, Biddulph Moor, Congleton, Cheshire, Soap Works Manager.
- O.M. Win-lee, H., c/o Tennants and Co., Clayton, Manchester, Manufacturing Chemist.
1892. Winstanley, Hy., Bridge House, Cheadle Hulme, Cheshire, Technical Chemist.
1886. Winstone, E. H., Members' Mansions, 36, Victoria Street, London, S.W., Ink Manufacturer.
1892. Wirtz, Dr. Quirin, 28, Great Ormond Street, London, W.C., Consulting Chemist.
1900. Wishart, Harlan L., c/o Repauno Manufacturing Co., Woodbury, N.J., U.S.A., Chemist.
1889. Wishart, Jno., 39, St. Vincent Place, Glasgow, General Manager (Oakbank Oil Co., Ltd.).
1902. Withers, Prof. W. A., State A. and M. College, West Raleigh, N.C., U.S.A., Professor of Chemistry.
- O.M. Witt, Dr. Otto N., Siegmundshof 21, Berlin, N.W., Professor of Chemistry.
1905. Wittmack, Chas. A., 606, West 113th Street, New York City, U.S.A., Chemist.

1904. Wolf, August S., Laboratory, E. L. A. S., 120, Broadway, New York City, U.S.A., Chemist.
1903. Wolt, Jacques, c/o Jacques Wolf and Co., Passaic, N.J., U.S.A., Manufacturing Chemist.
1894. Wolterbeck, Dr. H. C., 3, Edinburgh Mansions, Howick Place, London, S.W., Consulting Chemist.
1903. Wolton, Wm. R., c/o Joseph Fison and Co., Ltd., Ipswich, Manager.
1896. Wood, Ebenezer, Stephenson Street, Canning Town, E., Manufacturing Chemist.
1900. Wood, Frank, Hazellhurst, Doncaster Road, Barnsley, Yorks., Assistant Manager (Glass Works).
1901. Wood, Frank S., Chin Chu, Heathcote Street, Newland, Hull, Cement Works Chemist.
1887. Wood, Jos. T., 62, Park Road, Nottingham, Tanner.
1886. Wood, Wm., 20, Rue Général van Merlen, Antwerp, Belgium, Bleacher and Dyer.
- O.M. Woodcock, R. C., American and Continental Sanitas Co., 636-642, West 55th Street, New York City, U.S.A., Technical Chemist.
1902. Woodhead, Chas. E., 40, Westwood Street, Moss Side, Manchester, Chemist.
1884. Woodhead, Jas., Inglewood, Slaithwaite, near Huddersfield, Tar Distiller.
1890. Woodman, Dr. Durand, 127, Pearl Street, New York City, U.S.A., Analytical Chemist.
1900. Woodrow, John, 12, Park Road, Hull, Chemist.
1902. Woodside, T. Frank, c/o Warner Chemical Co., Carteret, N.J., U.S.A., Secretary.
1896. Woodward, Jas., 31, Coventry Road, Hford, Essex, Government Analyst.
1904. Woolcott, Geo. H., 2, Carolina Terrace, Montenegro, Cork, Ireland, Brewer's Chemist.
1904. Woolcott, Herbert, 41, Zuzan Street, Reading, Brewer's Chemist.
1896. Woolf, Julian, 51, Buckland Crescent, South Hampstead, N.W., Manufacturer.
1889. Woolf, Mortimer, Yeatman and Co., Denmark Street, E., and (Journals) Mayfield, Mortimer Road, St. John's Wood, N.W., Vinegar Brewer.
- O.M. Woolley, G. S., Victoria Bridge, Manchester, Pharmaceutical Chemist.
1901. Worden, Edw. C., c/o Clark Thread Co., Newark, N.J., U.S.A., Analytical Chemist.
- O.M. Worrall, H., Crimsworth, Whalley Range, Manchester, Dyer.
1903. Worstall, Robt. A., c/o Chicago Varnish Co., Chicago, Ill., U.S.A., Chemist.
1895. Worth, F. G., The Acetylene Illuminating Co., 3, Victoria Street, London, S.W., Managing Director.
1900. Worthington, Arthur, Starcliffe Terrace, Great Lever, Bolton, Chemist and Sub-Manager.
1894. Wotherspoon, Peter, 135, Bede Burn Road, Jarrow; and (Journals) c/o Union Cement Co., Ltd., 1, St. Nicholas Buildings, Newcastle-on-Tyne, Chemist.
1896. Wrampelmeier, T. J., E. I. du Pont de Nemours Powder Co., 39, Victoria Street, Westminster, S.W., Chemist and Representative.
- O.M. Wray, O. J. P., Haslemere, Coleraine Road, Blackheath, S.E., Technical Chemist.
1901. Wren, E. Cecil, Glencoe, Englescliffe, R.S.O., Co. Durham, Vinegar Brewer.
1895. Wright, Arthur C., c/o Turner, Morrison and Co., 6, Lyons Range, Calcutta, India, Chemist.
1904. Wright, A. M., 62, Harman Street, Addington, Christchurch, N.Z., Chemist (Christchurch Meat Co.).
1904. Wright, Chas. L., Electric Illuminating Co., Cleveland, Ohio, U.S.A., Chemical Engineer.
1901. Wright, Harold E., c/o Sir B. Samuelson and Co., Ltd., Middlesbrough, Chemist.
1885. Wright, Jos., 19, Arboretum Street, Nottingham, Lace Dresser.
- O.M. Wright, L. T., The Mountain Copper Co., Keswick, Cal., U.S.A., Chemist.
1894. Wright, Sidney B., Chemist.
1900. Wright, Walter J., 11, Albion Terrace, Faversham, Kent, Chemist (Cotton Powder Co.).
1890. Wülfing, Dr. Charles, Hönningen a Rhein, Germany, Technical Chemist.
1904. Wünsche, Fritz, Reichenbachstrasse 25p., Dresden-Altt., Germany, Chemist.
1890. Wyatt, Dr. Francis, 402, West 23rd Street, New York City, U.S.A., Consulting Chemist.
1905. Wyer, Malcolm G., The Library, State University, Iowa City, Iowa, U.S.A., Librarian.
- O.M. Wyld, Jno., The Avenue, Lidgett Park, Ronndhay, Leeds, Chemical Works Manager.

Y

1900. Yamaoka, S., 10, Nishikatamachi, Hongo, Tokyo, Japan, Chief Engineer.
1901. Yardley, Frank, c/o Henry Jutson and Sons, Liverpool Street, Birmingham, Chemical Manufacturer.
1899. Yates, Arthur, Lehong Donok, Bencoolen, Sumatra, Netherlands Indies, Metallurgist.
- O.M. Yates, F., 64, Park Street, Southwark, London, S.E., Chemical Manufacturer.
1897. Yates, Wm. H., 11, Lansdowne Road, Southport, Lancashire, Technical Chemist.
1898. Yetton, Thos., Fen Villa, Queen's Road, Loughton, Essex, Consulting Distiller's Chemist.
1894. Yocum, Dr. Jno. H., 325, Academy Street, Newark, N.J., U.S.A., Chemist.
1886. Yoshida, Dr. H., Imperial University of Kyoto, Kyoto, Japan, Professor of Chemistry.
1900. Yoshitake, E., 18, Tatsukacho, Hongo, Tokyo, Japan, Chemist.
1885. Young, Alfred C., 53A, Algiers Road, Ladywell, S.E.
1901. Young, A. H., Innes, Carlton, Little Sutton, Chester, Student.
1885. Young, Brongham, 2A, Sigdon Road, Dalston, N.E., Analytical Chemist.
1902. Young, Chas. C., c/o Farbenfabriken of Elberfeld Co., Charlotte, N.C., U.S.A., Colourist.
1890. Young, Dr. Geo., Lauraville, Bladda, Port Erin, Isle of Man, Chemist.
1904. Young, James, c/o Flax Pulp, Ltd., Weston Point, Runcorn, Cheshire, Chemist.
1900. Young, J. Bertram, 1639, North 19th Street, Philadelphia, Pa., U.S.A., Chemist.
- O.M. Young, Jno., 2, Montague Terrace, Kelvinside, Glasgow, Technical Chemist.
1886. Young, Jno., (Journals) Clarendon House, Beverley Road, Hull, Gas Engineer.
